Books concerned with educational matters may be sent for review to Miss Helen L. Cohen, Washington Irving High School. School text-books will not be reviewed.

The columns of HIGH POINTS are open to all teachers and supervising and administrative officers of the high schools. Manuscripts not found available for publication are not returned to contributors unless return is requested. All contributions *should be typewritten, double spaced, on paper 8½" by 11" in size.* They may be given to the school representative or sent directly to the editor.

A CONCEPTION OF EDUCATION

We believe . . .

That education is living;

That living implies individual and social growth;

That the process of growth, of achievement, of continuous and progressive improvement, rather than the static outcome and result, becomes the significant thing in education;

That any particular materials or procedure in education should render the learners capable of further education, making them more sensitive to conditions of growth and more able to take advantage of them;

That acquisition of skill, possession of knowledge, attainment of culture are not ends—they are marks and measures of growth and means to its continuing;

That truths for the guidance of a growing life are not dogmatically taught, but are achieved by the power of individual minds, guided by methods of observation, inquiry, experimentation, and reflection;

That moral growth is identical with and parallel to the development of the ability to make intelligent choices and render intelligent judgments;

That an educational program should be organized to provide a succession of activities which will best constitute a continuous reconstruction of experience, since experience is an affair primarily of action;

That any activity is educational which increases the ability intelligently to select, organize, and evaluate the situations that arise in the adaptation of the individual to the social and moral environment;

That the end of education is freedom, growing out of intellectual initiative and independent observation and foresight of the individual, whose mental attitude is socially guided and determined by the interests of the group of which he is a part;

That new ideas growing out of freedom in education find expression in social life and are translated into imaginative vision and the fine art of living;

That the school is primarily a social institution partaking of the nature of the home, the community, and other social agencies and binding them together in a mutual interplay of educational forces through a disciplined mind;

That the solution of the problems of our social order results from the integration of the reorganized and reconstructed experience of the past together with the experimental present, thus giving meaning and purpose to the present and setting up possibilities of directing our future to a satisfying conclusion of further growth through critical and constructive thinking;

That the Golden Age lies ahead of us and not behind us.

Prepared as a Group Project by members of the Institute of Education class in Philosophy of Education, New York University, conducted by Professor Alfred L. Hall-Quest at Bloomsburg, Pennsylvania.

November, 1932

REPORT OF THE DEAN OF BOYS AT THE THOMAS JEFFERSON HIGH SCHOOL

NOTE: The report that follows on work with boys is one of a series given at conferences held during the term February to June, 1932 under the direction of Mildred I. Freigang, Administrative Assistant and Dean. Child guidance in its various ramifications at the Thomas Jefferson High School is in charge of a group of co-worktrs under her general supervision. The present article necessarily gives but a partial picture. For a suggestion of the rest—the entire school is organized to meet the needs of the child—one may glance at the accompanying diagram which attempts roughly to denote both distribution of function and centralization of responsibility.

ELIAS LIEBERMAN,
Principal, Thomas Jefferson High School

YEARS ago the only "problem cases" of a high school were the so-called "bad boys." Pupils guilty of major infractions were referred to "disciplinarians," stern, "powerful" personalities who administered punishment in the form of severe reprimands, penalty assignments, demerits, detention, cancelling of privileges, demotion, and expulsion. The successful disciplinarian attained his ends, such as they were, by a display of authority and force. There was practically no attempt at guidance nor were the disciplinarians especially trained or chosen for corrective work. In some high schools troublesome pupils were reported to grade advisers, in others to departmental chairmen, floor managers, or to the director of the Student Service squad.

The earliest steps in the proper handling of problem children were made in connection with wayward girls. Since symptoms of emotional disorder were more easily detected in girls than in boys, and might have more serious consequences, it was thought advisable to assign the task of solving the problems of "bad girls" to women of special training and sympathetic understanding. Today in many all-girl and co-educational high schools one of the administrative assistants is also the "Dean of Girls" whose duties, although particularly concerned with girls, vary with the organization of their respective schools.

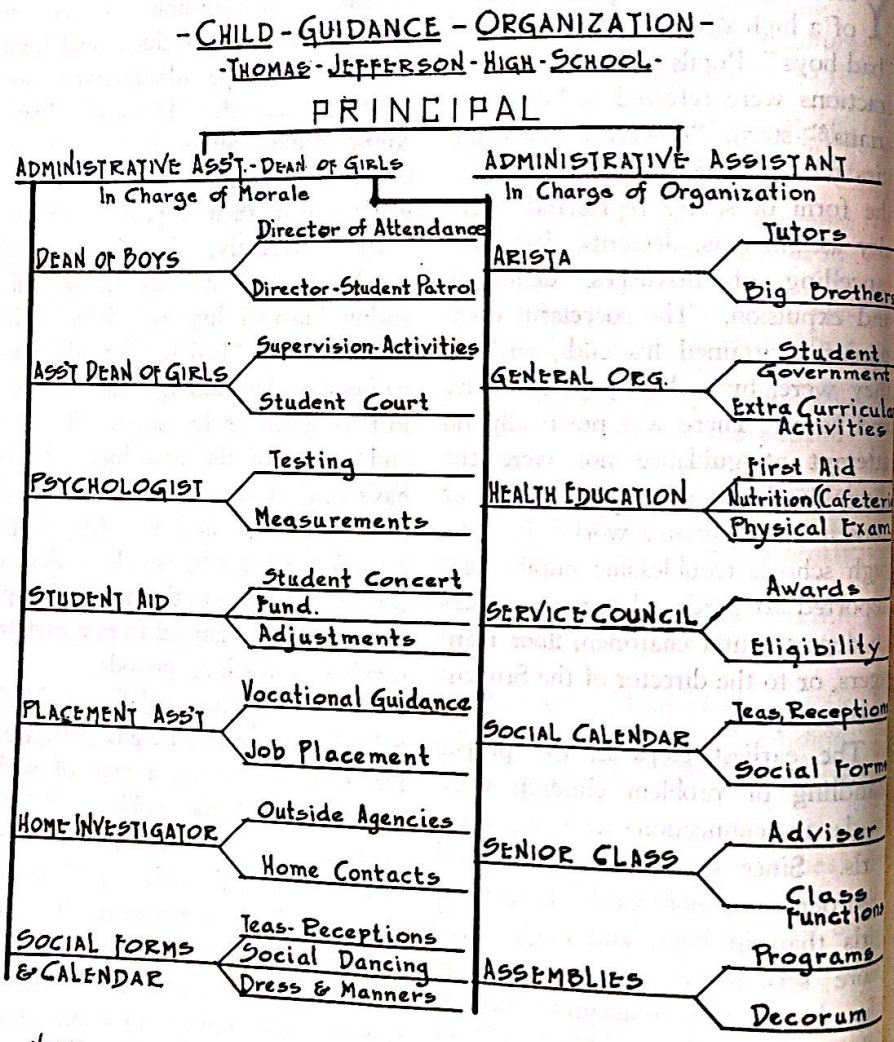
More recently, the findings of psychiatry and its educational offspring "mental hygiene" have indicated that the "bad boy" needs sympathetic understanding and guidance just as much as his sister. To this end, many of the new high schools have in their organization a "Dean of Boys," a rank and file (in salary rating) teacher who is able to devote considerable time to the needs of boys because he is exempted from a certain number of teaching periods.

When the Thomas Jefferson High School was organized eight years ago, Dr. Elias Lieberman, a man of wide experience with the problems of boys because of his activities in settlement work, included the office of "Dean of Boys" in his organization. To this post he always tried to appoint a man who, by training and temperament, was especially equipped to understand and guide the adolescent boy.

Scanned with CamScanner

From the very start such excellent work was done in this school in the field of child guidance that we at Thomas Jefferson feel that our "Department of Morale" headed by Miss Freygang, Administrative Assistant and Dean of Girls, anticipated the work now planned by the Bureau of Child Guidance of the Board of Education.

The appended diagram shows the organization of the Thomas Jefferson High School for the purpose of guidance. The administratice assistant and Dean of Girls coördinates all the agencies within the school that can be brought to bear upon the problems of boys and girls. Such coördination makes it an easy matter to refer specific problems to the proper department.



NOTE-The Grade Advisers and the Program Committee function under the direct supervision of the Administrative Assistant in Charge of Organization. The work of these two bodies is intimately connected, however, with effective Child Guidance

In such an organization it will be seen that the office of the "Dean of Boys" becomes a clearing house for all the problems of boys and that the chief value of the Dean is as a diagnostician who refers a pupil to the proper department after obtaining and interpreting all the relevant data.

The directors of attendance, student patrol, and traffic squad act as assistant deans and have their headquarters in the office of the Dean of Boys. This arrangement makes it possible for the Dean to integrate these important functions and to keep in close touch with truants and chronic offenders against law and order.

When pupils are reported to the Dean, the first procedure is diagnosis. There is no haste. Every effort is made to obtain complete histories, to get at under-lying causes, to understand the "whole" boy. Parents are consulted. When parents cannot or will not come, or when a better understanding of family conditions is necessary, the social service investigator establishes connections with the home.

Cases whose solution seem obvious are immediately referred to the proper department. I list below some of the type cases of considerable frequency whose diagnosis is not only readily obtained but also indicates the cure.

1. Behavior problems due to worry over failure in one or two subjects. Pupil is referred to tutoring committee of Arista.
2. Failure in entire program. Pupil is referred to psychologist for battery of tests. Program rearranged, or course of study changed, or trade school is advised. (Where failures are not the cause but the results of emotional disorders, the cases are handled by specialists on a psychiatric basis.)
3. Symptoms of protest or revolt because of the teacher-pupil equation. (For example, a pupil rebels when forced to repeat subject with teacher who failed him the previous term). Program is changed with consent of grade adviser, chairman of department and the teacher concerned.
4. Physical insufficiency. Referred to Health Education Department; nutrition class; clinics; eye-glasses, braces, treatment advised and financed by Student Aid Fund, if necessary. Elevator privilege. Light program.
5. Poverty. Placement Clerk for vocational guidance and employment. Student Aid. Outside agencies.
6. Immaturity, social insufficiency, bad companions, poor use of leisure time. "Big Brother" Committee of Arista; school clubs; intra-mural or varsity athletics; social forms class; opportunities for directed service.
7. Feelings of inferiority or inadequacy due to attitude of parents; odious comparisons with more successful children of family. Social Service investigator. Parents consulted and educated. Opportunities for school service; student patrol; clubs; athletics.

Scanned with CamScanner

Needless to say, in many cases the "cure" is neither complete nor permanent. We know, however, that we are making use of every department of a well-integrated organization to help our students adjust themselves.

The following is a list of some of the cases which we have every reason to believe were satisfactorily adjusted. Very serious cases, of course, were either adjusted entirely by outside agencies or adjusted by the school with their prescription advice and assistance.

1. R. Truant. Refused to attend classes. Third term. Repeating all subjects. Age 13. Rapid advance in elementary school without study.

Diagnosis: Rushed through elementary school. Did not know how to prepare lessons. Immature. Crushed by first failures. Browbeaten by parent, a physician who could not understand how his son could be a failure.

Treatment: Put in charge of Big Brother who escorted him to school and helped him prepare his lessons. Frequent interviews with Dean caused father to adopt different attitude.

Result: R. is now attending classes regularly and passing all his subjects but one.

2. J. Chronic disorder in class and corridors. Age 16. Height 6 ft. 4 in.

Diagnosis: Ostensibly proud of his unusual proportions, inwardly felt too conspicuous. No outlet for tremendous energy.

Treatment: Introduced him to coaches of swimming and basketball teams. Eventually he made the varsity in both sports. Although he remained a problem case, he behaved well enough to complete his course. At present he is a regularly licensed swimming instructor and content with his lot.

3. H. Truant. Age 15. Disorderly in school. Low I. Q. Wished to learn trade. Parent insisted on academic course.

Diagnosis: Protest. Tired of being compared with his brilliant older brother. Skillful with tools, wished to become an electrician.

Treatment: Transfer arranged to trade school. At present working as electrician's helper and satisfied.

4. P. Belligerent in school. Good student. Parent worried about his connections with a youthful gang of toughs, not members of the school, operating in the neighborhood. Joy-rides in "borrowed" automobile.

Diagnosis: Boy too easily influenced.

Treatment: Parents, well to-do, agreed to move far away. Transfer arranged to another school. Follow up.

Result: P. found new and better companions, was graduated with grades above average. At present he is attending College of Pharmacy, doing well. Parents are pleased.

5. F. Member of same gang. Poor scholar. Age 15. Found school work too difficult. Wished to enter business at once.

Treatment: Transfer arranged to private business school. F. now working as shoe-salesman and keeping out of trouble.

Note: The gang was broken up by the police, not, however, before one of its members was shot in a brawl and another was convicted of attempted burglary.

6. S. Failing all subjects. Age 16. Apathetic. Poor mixer. Parent severe. Complained he did not study. Spent all his time reading cheap novels. One other child in family, age 9, a girl.

Diagnosis: Jealousy of sister. Desired affection of parents. Parents cold. Failures in school, symptoms of protest.

Treatment: Education of parent who had been deceived by the boy's apparent resentment of overtures of affection. Mother and child introduced to each other all over again.

Results: S. changed completely when he realized parents really loved him. Passed all subjects for three consecutive terms and was graduated. Now attending college at night and working during the day.

7. Z. Chronic disorder. Hysterical rage when reprimanded. Made scenes. Age 17. Fourth term. Low grade explained by long absence because of illness. Mature. Amenable to reason when calm.

Diagnosis: Investigation showed illness was nervous disorder. Doctors pronounced him cured. Hysterical outbursts superinduced to revive situations pleasant to him when he was ill and to enable him to escape responsibilities.

Treatment: Education of parents. Examination by specialist showed he was well physically and mentally. Frequent interviews with Dean. Unmasked.

Result: Complete change. Toned down. Completed course. At present attending college at night. Working as a counter salesman during the day.

8. S. Refusal to recite in elocution class. Cut elocution frequently. Age 16. Height 6 ft. 2 in. Bashful. Poor student.

Diagnosis: Typical symptoms of over-grown boy. Felt too conspicuous for his poor scholarship.

Treatment: When asked why he did not try to make athletic teams, he replied that he was too clumsy. Introduced him to football coach.

Result: Played regularly on football team until his graduation. No further trouble.

9. A. Ran away from home four years ago. No trace. Parents thought he was dead. Age 16 at the time. Arista calibre. Omnivorous reader. Suddenly reappeared at the beginning of the current term and asked for advice from the Deans. Explained that he had run away because of a family scandal. Refused to go home and threatened to run away again if his parents were informed of his return. Wished to complete high school studies in order to enter a technical college. Claimed he was self-supporting.

Diagnosis: He really wanted to return to his parents but feared that they hated him and would not forgive the suffering he had caused.

Treatment: Parents were notified at once. Agreed to wait until boy returned of his own volition. Meet-

Scanned with CamScanner

ing arranged with brother. Everything cleared up. Arranged enrollment in evening high school. Course mapped out.

Result: A. returned home. Attending night school regularly. Reports regularly to Dean who teaches in the evening school which he attends.

10. B. Chronic trouble maker in subject classes and in cafeteria. Fair student. Tall. Good-looking. Vain. Worked as usher in large theatre.

Diagnosis: Outward bravado, inward feeling of inferiority. Desired to attract attention.

Treatment: Induced him to join school operetta.

Results: He performed in leading rôle, attended rehearsals regularly for months, and kept out of trouble during that time.

11. I. Truant. Indifferent student. Good-looking. Effeminate.

Diagnosis: I. loves father, who is ostensibly a failure in life. Forced to model himself after his mother, who dominates everyone and everything. Mother keeps boy near her all the time. Truancy and failures the result of protest and wish to identify himself with his father.

Treatment: Education of parent. Frequent interviews with boy.

Result: I. attends school regularly now. Case still pending.

Although the cases listed above have been submitted in outline form, one should not assume that the pupils involved were treated arbitrarily, categorically or with haste. Many important details were omitted for obvious reasons. Some cases were under consideration for a long time. During the past eight years the Dean of Girls and the Dean of Boys handled thousands of cases, ranging from brief interviews on routine matters to complicated adjustments involving our entire department of guidance. In this work we received valuable assistance from the class teachers who have become more and more "mental hygiene" minded and have developed that attitude of class "awareness" so necessary for the understanding of the "whole" pupil.

We are especially indebted to our principal, Dr. Elias Lieberman, who conceived and inspired our work in child guidance and whose friendly supervision and sage advice aided us immeasurably both in the organization of the department as a whole and in the solution of difficult problems.

We have tried to show in this report how adjustments in cases that are not too intricate can be successfully made by the agencies within a school properly organized for guidance. Clinical cases belonging to the field of abnormal psychology should be, and in this school always have been, referred to professional psychiatrists.

We close this report with a detailed account of a major adjustment accomplished by the Dean of Boys and Dean of Girls working together. A case of this nature ordinarily beyond the scope of a high school was undertaken by the Deans because outside agencies had failed.

X. A girl, age 16, Arista caliber, emotional disorder. Major symptom—complete loss of voice at frequent intervals. Recently had undergone operation for removal of tonsils. Referred her to throat clinics. Clinics pronounced operation successful and referred her to psychiatrists. Psychiatrist referred her back to surgeons, and so on.

Diagnosis by Dean: X., a very fine type of girl, was very dissatisfied with life. She studied many hours every day and then worked at counter in her father's candy store until midnight. She found this work very tiresome and unpleasant. She had no time for recreation or social life. She wanted to step out, "wear fine clothes," "go places." Often had vaguely formed ideas of suicide.

After her operation for the removal of tonsils she became quite ill. For a while she could not speak. She exaggerated her condition and thought she was dying. She left the hospital fully recovered. She associated loss of voice with death. Afterwards when moved to self-pity and ideas of suicide she lost her voice. When the full story had been elicited from her, she readily admitted that she could prevent the loss of voice if she wished to. She has not lost her voice since the beginning of the current term.

Proper steps were taken for the education of the parents and the improvement of family conditions.

The girl found recreation and social life in the activities of the school. Follow up. She seems happy today and exhibits no symptoms.

SAYWELL B. MULDORF,
Dean of Boys.
Thomas Jefferson High School.

ROADS TO CREATIVE TESTING IN HIGH SCHOOL SCIENCE

AT THE present time most of us are agreed, at least in theory, that in the ideal school situation the student should be interested in his work if worth-while results are to be obtained. Coming now to tests, the question is: How interested are students in taking them? Obviously, there can be no absolute answer, inasmuch as their attitude hinges upon a variety of complex factors: the type of test, the amount of material covered, and many others. Nevertheless, the chorus of disgusted Oh's and Ah's greeting the ears of the teacher when a test is announced would appear to furnish some evidence that examinations are, to say the least, distasteful. It seems obvious, therefore, that some thought should be devoted to a consideration of how to affect for the better the attitudes of students towards tests. True, many are convinced that our pupils will always dislike taking them because the irksome task of reviewing the past work is involved. However, the writer believes it to be entirely feasible to change this attitude

Scanned with CamScanner

for the better, save for those few students who will always resent a "showdown" on their lack of achievement.

Some time ago, four of the writer's classes were given an essay-type test based upon a unit of work in biology. As soon as they had finished, the students were given a mimeographed sheet bearing the following instructions:

Below you will find a list of ten possible ways to spend an hour. Read the list carefully and then decide which of the ten you would like most to do. Place the number one (1) in the parentheses to the right of your choice. Then decide which of the nine remaining possibilities you would next prefer to do. Place the number two (2) in the parentheses next to this choice. Continue until you have numbered all ten possibilities in the order of your preference. (The results for this first questionnaire, based upon the essay-type test, are shown in column I.)

While it is true that other factors, for instance, the difficulty of the unit[2] may have contributed to the above results, still it is evident that the essay-type test is unpopular with the student. The somewhat onerous task of running errands for mother is preferred! Moreover, numerous conversations with the students served to verify this.[3]

Three weeks later, they were given a new-type test consisting of 30 true-false, 20 completion, 10 multiple choice, and 10 matching items. Again they were given the questionnaire to fill out. From the results given in column II, it may be seen that the task of "taking a test similar to the one just taken" had advanced from the eighth to the fifth place; indicating that this type of test is much more to their liking than the essay-type.

	I	II	III	IV
1. Go swimming[1]	(1)	(2)	(1)	(1)
2. Go to the movies	(2)	(1)	(2)	(2)
3. Do an experiment in biology	(3)	(3)	(4)	(4)
4. Listen to a lecture on biology	(4)	(4)	(5)	(5)
5. Read your text-book	(5)	(6)	(6)	(6)
6. Run errands for your mother	(6)	(8)	(8)	(8)
7. Do written homework in biology	(7)	(7)	(7)	(7)
8. Take a test similar to the one just taken	(8)	(5)	(3)	(3)
9. Wash the dishes after supper	(9)	(9)	(9)	(9)
10. Stay after school for bad behavior	(10)	(10)	(10)	(10)

This procedure was pursued a step further. Boys and girls of high school age, if given only a little encouragement, can do surprisingly well those things which we are prone to believe only teachers can do. To a deplorable extent, we tend to assume all responsibility and initiative in the classroom, thus cutting down upon the creative opportunities of the student. We fail to realize that it is through precisely those activities which we so unnecessarily take upon ourselves that true growth and education are to be fostered.

Allowing the students to devise their own tests is an excellent means for increasing their "creative opportunities." In practice, this was accomplished by the writer and each of his classes, who jointly selected a committee of four students. Their duties were not only to devise but to administer and mark tests.

After two new-type tests had been written and administered by the committee for each class, the students were again given the questionnaire to fill out. The results, seen in column III, show them to be overwhelmingly in favor of their own tests. We may conclude that the use of this simple procedure is a step in the right direction, whereby interest in tests will encourage effort on the part of the student.

However, we have not yet exhausted the possibilities of stimulating interest and effort in testing. With the system of marking which we now employ, we tend to set student against student; encouraging them to "beat" their neighbors. Vicious effects are often produced in that the backward child is hopelessly discouraged by his consistently low standing while his brighter neighbor is spoiled. This undesirable state of affairs may be minimized by the simple device of having students compete for marks, not against their fellows, but against themselves. To achieve this, the first requirement is for the teacher never to divulge a student's grade to the rest of the class. The second is to have each student graph his test results so that he may be in a position to see at a glance whether or not he is making progress.

However, a difficulty which arises is this: a mark of 85% received by a student in one test may be the equivalent of 65%, let us say, received in another. This follows from the fact that tests vary in difficulty. In this case, a student's graph would have no meaning since the drop of 20 points is only a seeming drop. This difficulty may be avoided by the simple device of ascertaining the central tendency—mode, mean or median—of a class or of a number of classes in preceding tests. This will give us a *standard* mode, mean, or median. For information as to the derivation of the mode, median, or mean, any elementary text-book of educational statistics is suggested. The next step is to obtain the central tendency of the test which we desire to graph. For example, let us assume that our standard mean (the arithmetic average of a number of classes in preceding tests) is 72% and that the test which is to be graphed has a mean of 67%. This would indicate, roughly speaking, that the test is more difficult than usual. Consequently, the difference between the two means (5%) should be added to all the grades of the test. Similarly,

[1] The above ten choices were not presented in the above order lest it influence the student.

[2] The unit in question was the structure of the digestive system.

[3] Similar results were obtained by a fellow science teacher who employed the identical procedure in veryifying the results given in all four columns. Altogether, 201 students took part in the experiment.

The results given in column I should not be interpreted as meaning that the essay-type question should be abandoned. There are many excellent reasons which might be advanced for its inclusion in tests.

Scanned with CamScanner

if the mean of the test to be graphed is 79%, the difference (7%) should be subtracted from all the grades before returning the papers. It should be noted that there are more accurate methods of equating tests. Nevertheless, it will be found that the above method is the most convenient for ordinary use.

The writer found that the practice of graphing supplied an astonishingly potent form of motivation both for bright and dull individuals. Altogether, three new-type tests (devised by the writer) were given the students to be graphed. At the end of the third test, the questionnaire was again administered. The results, seen in column IV, conclusively demonstrate the popularity of graphing with students.

Besides the above, there are other, perhaps more artificial means of stimulating interest in tests. To begin with, why not use new types of questions? In the past we have ignored the fact that new varieties of test items not only add interest and zest to testing, but may also measure certain types of information more effectively than do those in common use. A favorite of the writer is the code-type of question.

Instructions: By finding out what each letter of the following code word stands for, you will discover the name of a great scientist whose work will be taken up later.

U	N	Q	S	A
( )	( )	( )	( )	(H)

Solve it as follows:

Letter A: Place an H in the parentheses below letter A if carbon dioxide is given off in respiration. If it is not given off, place the letter P below letter A. (Since this gas is given off, H is correct. Consequently it is placed below letter A.)

Letter N: Change to O if root hairs take in soil water through the process of osmosis. If they do not, change to E.

Letter S: Change to N if lack of vitamin D causes scurvy. Change to R if lack of this vitamin causes beri-beri.

Letter Q: Change to E if haemoglobin is not present in red blood cells. If it is present, place *nothing* in the parentheses below letter Q.

Letter U: Change to S if the ovary of a flower is part of the perianth. Change to K if it is part of the pistil.[1]

The use of contests is also suggested. In practice, the writer divides the class into two equal sections. The students are then given slips of paper, each bearing a question based upon a previous unit or units of work. After five minutes, a member from each group recites alternately. The writer acts as referee, deciding whether the answers are correct, partially correct, or incorrect. His decision may be challenged by any member of the class. It will be found that such contests are amazingly effective in provoking a critical and questioning spirit on the part of the students, especially if the teacher encourages them in defending their views. It is, perhaps, not too far-fetched to say that this is in accordance with the spirit of science as contrasted with that of authority; in accordance with the spirit of Galileo, who, when forced by the Inquisition to recant his statement that the earth revolves about the sun, is said to have muttered under his breath, "Eppur si muove"—and yet it moves.

As we all know, students who have just completed an examination are especially eager to go over it with someone who can check their work. Why not harness this splendid learning attitude by going over the answers as soon as possible? Common sense would indicate that the teaching value of a test is especially high if it is gone over immediately and that there is a sharp decline in this value if much time elapses between the time a test is given and the time it is gone over. So the motto of the teacher after giving an examination should be to "strike while the iron is hot."

A final point which cannot receive sufficient emphasis is this: we must endeavor to give the student some sort of insight into the purposes of testing. In too many instances, he has little understanding of what is expected of him other than a high mark. He fails, as a rule, to realize that one of the most important, if not the most important, function of a test is to have him review his work for permanent acquisition. Can we wonder why the practice of last-minute cramming is well-nigh universal?

The responsibility for this state of affairs falls squarely upon the teacher. He, too, requires more insight into the aims and purposes of testing. This, alone, can do away with so-called tests of science, depending largely upon memoriter knowledge of the text-book. It is unnecessary to dwell upon the fact that memorization of the facts of the text kills a science and that examinations, based upon these same facts buries it.

A MODIFIED COURSE IN FIRST YEAR MATHEMATICS

SEVERAL years ago the writer contributed an article to HIGH POINTS describing a modified course in geometry introduced at Manual Training High School for the benefit of pupils unable to assimilate the formal Regents' course. Since that time the high school enrollment has continued to increase steadily and substantially. It is becoming increasingly evident that a considerable number of boys and girls in the first year of high school, possibly twenty per cent of the total in this grade, lack the mental ability necessary to succeed in elementary algebra. For these pupils we have organized and put into operation this term a modified one-year course in mathematics.

Scanned with CamScanner

If pupils who lack the necessary mental equipment for success in algebra are compelled to pursue this subject, as is generally the case at the present time, they are bound to fail in large numbers. At best they will complete the course in probably twice the normal time. When they do pass, they have acquired very little real mathematical mastery or appreciation. Is the enormous outlay of time, energy and City funds expended on such pupils justified in the light of the doubtful and scanty return? Some educators whose interests and sympathies, I might say prejudices, are hostile to mathematics, believe that this lowest group should be denied all mathematical training in high school. Against this view, not only all teachers of mathematics but all persons seriously concerned in the educational welfare of our high school boys and girls should rise in arms. The remedy is not "Give them no mathematics!" but "Give them mathematics which they can understand, mathematics which appeals to them as interesting, and practical as well as educational, mathematics which *can* and *will* function in their lives, in school and out, and help make them more efficient and more useful members of society!"

At present, the lowest twenty per cent of our students, as determined by intelligence tests, take this modified course. The course is open also to pupils who have failed badly and repeatedly in first term algebra. We are experimenting, however, with a specially constructed arithmetic test as an instrument to forecast probable success or failure in algebra.

General Description of the Course

Content

It is not expected that the pupils enrolled in this course will ever take any additional mathematics. Consequently, the most valuable elements of mathematical content and training in the light of the degree of ability possessed by this group have been incorporated into the syllabus. The general content of the course is as follows:

1. A review of the fundamental processes of arithmetic and their application to common business problems and other familiar situations within the range of the pupils' experiences and interests.

2. Statistical graphs. (Intelligent reading of newspapers and magazines demands at least an elementary knowledge of this subject.)

3. Informal Geometry.
   (a) An elementary study of form and geometric relations and constructions.
   (b) Mensuration of lines, angles, common areas and volumes.
   (c) Indirect measurement.

4. Beginnings of Algebra.
   (a) Development of a generalized number idea.
   (b) Meaning and use of the formula and the equation.
   (c) Application to simple problems in arithmetic and mensurational geometry.

Method

The method of instruction, like the content, must be adapted to the inferior assimilative powers of this group. Care should be taken that each new topic be introduced concretely. In arithmetic, the business life situations back of profit and loss, commission, interest, insurance, and the like, should be made real and understandable to the pupils. Plenty of opportunity should be allowed for class discussion. Copious drill should be provided, oral and written, and varied as to type. In graphic work and in informal geometry, each pupil's desk, equipped with ruler, compasses and protractor, should serve as a laboratory in which number relations and important properties of geometric form are discovered, measured, studied and applied. Above all, the teachers assigned to these classes must be patient, sympathetic, ingenious, and capable of meeting the pupils at their known intellectual level.

Syllabus

In the interest of definiteness, the syllabus for each term has been arranged in seventy full-period lessons, including six review lessons and six class tests. Inasmuch as the average Fall term contains between eighty and eighty-five actual teaching periods, and the Spring term is even longer, it is believed that sufficient time has been allowed to complete the course with ample provision for review.

It should be noted that comparatively few lessons are devoted to drill in fundamental arithmetic operations: addition, subtraction, multiplication, division of integers, fractions and decimals. It is better that most of this work be handled incidentally in connection with applied topics calling for skill in these processes.

The sequence of topics provides for the correlation of algebra with arithmetic (as exemplified in the extensive use of the equation to solve the indirect cases of percentage, profit and loss, commission, taxes, insurance, etc.), the correlation of geometry with arithmetic (as in drawing to scale and the simpler exercises in mensuration), and the correlation of geometry with algebra (as in the somewhat more involved exercises in mensuration and in numerical work applying geometric relations).

Text-book

The text-book employed is "Modern Practical Arithmetic" by Hayes, Gibson, Bodley, Watson (D. C. Heath & Company). This book contains, in addition to a large amount of practical arithmetic, a considerable body of material in informal geometry and algebra.

Syllabus Proper

First Term

Period

1. Perimeters of rectangles and squares, pp. 169-170. Use of graph paper is recommended. Review table of linear measure, page 445.
2. Areas of rectangles and squares, pp. 169-170. Review table of square measure, page 446. Use graph paper to derive formula.
3. Drill on addition and subtraction of integers and decimals, pp. 2, 3, 4, 5, 7.

Scanned with CamScanner

First Term—(continued)

Period

4. Drill on addition and subtraction of fractions, pp. 3, 8.
5. Drill on multiplication of integers by integers and by fractions, page 9.
6. Construction of circles, pp. 178-179, including meaning of center, radius, diameter, arc.
7. Circumference of circle. Derive formula experimentally. Use Pi equals 22/7.
8. Area of circle, pp. 180-181.
9. Review lesson.
10. Test.
11. & 12. Drawing to scale, pp. 375-378. Consult Math. 3 syllabus for additional exercises on this topic.
13. Division of integers and fractions, pp. 13, 16.
14. Useful short cuts in multiplication and division, pp. 10, 14, 15. Select the most commonly used short cuts.
15. Finding a fraction and a per cent of a number, pp. 17, 28-30.
16. Profit and loss: given cost and per cent gain or loss, find gain, loss, selling price, page 44, ex. 23-29 and other selected exercises of this type on pp. 45, 46, 47.
17. Computing profit and loss on selling price, pp. 48-49. Select exercises in which selling price and rate of gain or loss is given.
18. Commission. Explain commission. Select only exercises where the amount of commission or proceeds is to be found, page 52, ex. 8-23; page 53, ex. 30-33 and other exercises of this type on pages 53 and 54.
19. Review lesson.
20. Test.
21. Trade discount. Finding amount of discount and net amount when list price and per cent discount are given, page 60; page 61, ex. 1-4, 7, 8, 9 and selected exercises of this type on pages 62, 63, 64.
22. Successive discounts, pp. 65, 66. Finding net price when list price and per cents of discounts are given.
23. Bills and discounts, pp. 68, 69, 70.
24. Insurance, meaning and use, pp. 71, 72. Finding premium when policy face and rate of insurance are given. Selected exercises: page 73/1, 2, 4; 74/11; 75/14, 15.
25. Taxes, discussion, pp. 76, 77. Finding amount of tax when assessed valuation and tax rate are given, page 78/2, 6; 79/7, 9, 10, 11, 12; also selected exercises on page 81.
26. Interest. Finding interest and amount, pp. 103-109.
27. Finding difference in time between two dates, pp. 110, 111.
28. Promissory notes, description, pp. 129-134. Computing interest on promissory notes, pp. 135-136.
29. Review lesson.
30. Test.

First Term—(continued)

Period

31. & 32. Bar graphs, construction and interpretation, pp. 379-380, 383-385, 387, 389, 390, 395.
33. & 34. Broken line graphs, construction and interpretation, pp. 382, 388, 390, 391, 392, 395.
35. Meaning, notation, kinds of angles (right, acute, obtuse, straight), meaning of perpendicular, pp. 157, 365, 366.
36. Measurement of angles by means of protractor, construction of angle equal to a given angle by protractor, page 157. Table of angle measure, page 157.
37. & 38. Circular graphs, construction and interpretation, pp. 382, 386, 393, 394.
39. Review lesson.
40. Test.
41. Checks, bank accounts, pp. 137-140, 141, 142.
42. Verifying monthly bank statements. Make up exercises of this type.
43 & 44. Bank discount, pp. 143-147, 264.
45. Sending money by draft, pp. 148-150.
46. Sending money by postal money order, pp. 151, 152.
47. Marking goods (beginning of algebraic symbolism), pp. 245, 247.
48. Meaning of algebraic expressions of the general form a x as x, 2x, .5x, 1/3x, etc. Evaluation for numerical values of x, meaning of

First Term (continued)

Period

coefficient. Select exercises on page 400, such as 1-5, 14, 17, 18, 20, etc.

49. Review lesson.
50. Test.
51. Meaning of equation, solution of equations of the type $ax=b$ by means of division axiom, pp. 415, 419. Select exercises such as page 415/4, 11, 17, 18, 26, etc.
52. Solution of equations of the type $\frac{a}{b}x=c$ by means of multiplication axiom, p. 418/37-40.
Make up additional exercises of this type, especially exercises like $4y=8$, $\frac{3}{100}x=6$, etc.
53. Application of equations to finding the number of which another is a given fractional or decimal part, page 19.
54. Application of equations to finding what fractional or decimal part one number is of another, page 18.
55. Application of equations to finding what per cent one number is of another, pp. 31-33, 41 C and D.
56. & 57. Application of equations to finding the number of which another number is a given per cent and miscellaneous problems, pages 34-40, also page 42 E and F.
58. Application of equations to profit and loss problems, that is, finding the cost or the rate of profit or loss, pp. 43-46.

Scanned with CamScanner

First Term (continued)

Period

59. Review lesson.
60. Test.
61. Application of equations to profit and loss, continued, pp. 47-49.
62. Application of equations to commission, that is, finding the selling price or commission rate, pp. 57-59.
63. Application of equations to exercises on trade discount where rate of discount or list price is to be determined, pp. 62, 63, 64.
64. Lines: different kinds (straight, broken, curved), naming of lines, line segments, measurements of line segments with compasses (including laying off a line segment equal to a given segment, to the sum and difference of given segments).
65. Bisection of a straight line segment, page 367. Verify by ruler measurement and by compass measurement. Apply to division of a line segment into 4, 8 equal parts and to finding the side of a square when the perimeter is given.
66. Erection of a perpendicular to a given line at a point in the line. Verify construction with protractor. Page 182, including exercises, also selected exercises on pp. 369, 370.
67. Construction of square and rectangle with straight edge and compasses, pp. 183-184, exercises on page 189.

First Term (continued)

Period

68. Construction of acute, obtuse and right triangles, pp. 183, 184, ex on page 189.
69. Bisection of an angle. Verify construction with protractor. Page 368. Apply to selected exercises on pp. 369-370, especially construction with straight edge and compasses of an angle equal to 45°, 22½°, etc.
70. Construction of an angle equal to a given angle by means of straight edge and compasses, page 369. Verify construction with protractor. Apply to geometric construction of an angle equal to twice a given angle, sum and difference of two given angles.

Second Term

1. Review the following geometric constructions: bisect a line, bisect an angle, construct a right angle, construct an angle equal to a given angle. Pages 182, 183, 187, 368.
2. & 3. Construction of a triangle congruent to a given triangle by making asa=asa, p. 371; by making sas=sas, pp. 371-372; by making sss=sss, p. 372.
4. Construction of a line parallel to a given line. Show also how draughtsmen construct parallels by means of triangles.
5. Definition of parallelogram, geometric construction of parallelogram, page 188. Derive experimentally, by paper cutting, the

Second Term (continued)

Period

formula for the area of a parallelogram.

6. Application of the formula K=bh as an algebraic equation for finding area, base or altitude of a parallelogram and rectangle, pp. 166/1-4, 167/22, 23. Make up additional exercises in which the base or altitude is unknown.
7. & 8. Derive by paper cutting the formula for the area of a triangle, K=½bh, and apply it as an equation to determine the area, the base or the altitude when the remaining parts are given, pp. 166-167. Include exercises on right triangle areas.
9. Review lesson.
10. Test.
11. Application of algebraic equations to exercises in insurance in which the rate or face of the policy is unknown, pp. 73-74.
12. Application of algebraic equation to exercises in taxes in which the tax rate or assessed valuation is unknown, pp. 78, 79.
13. Ratio, pp. 282-283.
14. Proportion; product of means equals product of extremes; solving proportions for unknown term, pp. 284-285.
15. Solution of simple problems by means of proportion, pp. 286-287-288.
16. Enlarging or reducing a given triangle by constructing corresponding angles equal. Define similar figures. Verify by measurement

Second Term (continued)

Period

that corresponding sides of similar triangles are proportional.

17. Enlarging or reducing rectangles, squares and parallelograms, pp. 373-374.
18. Application of proportion to finding sides of similar polygons. For example, the sides of a triangle are 4″, 5″, 8″; find each side of a similar triangle whose smallest side is 6″. Include similar exercises involving squares, rectangles and parallelograms.
19. Review lesson.
20. Test.
21. Lateral and total surfaces of rectangular solids, including cubes. Use models of these solids. Make up suitable exercises.
22. & 23. Volumes of rectangular solids, including cubes, pp. 277-281.
24. Volume of a prism, page 309. Display models of prisms.
25. Review finding circumference and area of a circle when radius or diameter is given, pp. 305-306-307, 308.
26. Lateral area and total area of a cylinder, pp. 310-311. Display model of cylinder.
27. Volume of a cylinder, pp. 311, 312.
28. Surface and volume of a sphere. Make up easy exercises. Include finding surface and volume of the earth assuming it to be a sphere of radius 4,000 miles.
29. Review lesson.
30. Test.

Scanned with CamScanner

Second Term (continued)

Period

31. Powers of numbers, pp. 291-292, and square root of numbers by inspection, page 293.

32. & 33. Extraction of square root including finding result to one or two decimal places, pp. 294-297.

34. & 35. Pythagorean theorem for right triangles verified on graph paper. Apply to finding hypothenuse of a right triangle when the arms are given, pp. 299-302, and finding diagonal of a rectangle or square, page 303.

36. Addition of like positive terms, pp. 398-399.

37. Algebraic expression of perimeters of rectangles and squares, pp. 404-405. Numerical evaluation of above.

38. Meaning and evaluation of monomials, page 400.

39. Review lesson.

40. Test.

41. Algebraic expression for area of a square and for volume of a cube, pp. 404, 406. Include numerical evaluation.

42. Evaluation of simple binomials, page 401.

43. Meaning of positive and negative numbers, page 411. Show also graphic position of positive and negative numbers with reference to the zero point on a straight line.

44. Addition of like terms, positive and negative, pp. 412, 413.

Second Term (continued)

Period

45. Algebraic solution of problems involving perimeters of squares and rectangles leading to equations of type $ax=b$, pp. 423, 424.

46. Formula building. The pupil should be led to derive the following formulas after a consideration of a sufficient number of illustrative numerical cases:

Profit and loss:	$S=C+P$, $S=C-L$, $C=S-P$, $C=S+L$, $P=Cr$, $L=Cr$.
Commission:	$C=Sr$
Interest:	$I=prt$, $A=p+prt$
Distance:	$d=rt$
Tax:	$T=Vr$
Cost of articles at p cents each:	$C=pn$

47. & 48. Use of formulas given in preceding lesson to solve the simpler problems in interest, profit and loss, taxes, insurance, pp. 432, 433, 434, 439, 440, 441.

49. Review lesson.

50. Test.

51. Meaning of average. Apply to finding average mark, average earning, average temperature, baseball average. Make up suitable exercises of this type.

52. & 53. Stocks, pp. 265-268.

54. & 55. Bonds, pp. 269-271.

56. Investments, pp. 272-274.

57. Mortgages, page 459.

58. Income tax. Make up simple exercises in computing New York State income tax.

59. Review lesson.

60. Test.

Second Term—(continued)

Period

61. Verify by means of protractor or by juxtaposition the fact that the sum of the angles about a point equals 360°, also by protractor or superposition that vertical angles are equal. Make up simple numerical exercises based upon these properties.

62. Construction of isosceles triangle, equilateral triangle.

63. Verify by protractor or superposition that base angles of an isosceles triangle are equal. Verify by protractor that each angle of an equilateral triangle is 60°. Apply to geometric construction of an angle of 60°, 30°, 15°, 120°.

64. Verify by protractor or juxtaposition that the sum of the angles of any triangle is 180°. Make up simple numerical exercises, arithmetic and algebraic, making use of this fact.

65. Construction of right triangles by means of ruler and protractor when an arm and an acute angle are given, when the two arms are given, when the hypothenuse and an acute angle are given.

66. Drawing right triangles to scale when parts mentioned in preceding lesson are given and determining the approximate true values of the remaining parts by measurement. For example, construct a right triangle in which an arm is 50 ft. and an acute angle is

Second Term—(continued)

Period

35°; what is the length of the other two sides of the triangle?

67. Angle of elevation. Solve problems involving angle of elevation by means of scale drawings. Select exercises in Wells and Hart, New Elementary Algebra, page 263. Use round numbers for lengths of sides.

68. Meaning of opposite side, adjacent side, with reference to an acute angle of a right triangle. Use of table multipliers (tangents) to find the length of the opposite side when the adjacent side and the acute angle are known. Solve the same exercises of preceding period by means of this table of multipliers.

69. Solving additional problems in indirect measurement by means of scale drawings. See Wells and Hart, New Elementary Algebra, pages 270, 271, ex. 19, 20, 28, 34. Use round numbers.

70. Use of table of multipliers (sines) to find the length of an arm of a right triangle when the opposite acute angle and the hypothenuse are given. Apply to simple improvised problems in numerical trigonometry. It is not necessary to teach the definitions of sine and tangent or even to mention these terms.

CHARACTER TRAINING *

THE SCHOOL must face the situation that character training is one of its most important problems today. This problem would present no difficulties to the school if each child came to it with a good inheritance, intelligent parents, and appropriate environmental influences. Unfortunately this situation does not obtain. As a result the school is compelled to take over the work of these other social agents in addition to the burdensome task which it already has to accomplish.

There are, it seems to me, certain pertinent questions that we ought to ask ourselves about character training before we can definitely determine the whys and wherefore of our methods and procedures. These questions are: What are the elements to be considered in character training? Can the school deal with these elements? If so, how? Finally, what precautions must we take in dealing with such elements?

The elements of character can only be studied in relation to action because it is by virtue of action or by the inhibition of an action that an individual makes known the texture of his character to others and even to himself. Let us see what elements operate to compel an individual to choose one course of action from among many and to carry it into effect. The execution of an act involves the functioning of desires, the play of ideals, habits and attitudes to make a proper choice, and the exercise of the will to enforce action. For example: Johnny Brown on a bright, sunny school morning suddenly gets the desire to go down to the beach to take a swim. He is immediately confronted by his habit of never having been late to school, his boast at home that he has never yet been absent from school, and by his attitude of fearful respect which he bears towards his father who, he feels, might be seriously displeased were he to receive a notice that Johnny had played truant. All these factors immediately begin to play upon Johnny's mind and have a distinct bearing on his choice of action, and if Johnny's ideal, habits and attitudes are urgent enough, Johnny's will will be set into motion and compel him to hasten with renewed energy to school. It is important to note that the will functions only when ideals, habits and attitudes are very firmly rooted. Therefore, our program in character training ought to be the proper development of ideals, habits and attitudes.

Now there are two schools of thought with reference to character training. One school believes that proper ideals, habits and attitudes may be implanted by the direct teaching of ethics as a distinct subject in the course of study. The other school believes that character training should be carried on incidental to classroom instruction whenever the subject material presents a basis for human interest or whenever classroom discipline presents a problem.

I favor the incidental method of character training, first, because it is practically impossible to get a sufficient number of teachers who are temperamentally qualified to arouse the impulses or emotional attitudes that are essential to create moral behavior; secondly, because moral conduct is a cumulative product of years of experience; and thirdly, because character is the outcome of many factors, the least important of which is instruction in morals.

How are we to proceed in the classroom in order to build up these elements of character incidentally? We stated previously that desire precedes action. The school has no need to create desires because they are always present either consciously or subconsciously. The problem of the school is, rather, to focus consciousness upon appropriate desires so that they may be the ones chosen by the individual from among other desires for fulfillment. The choice of an appropriate desire is dependent upon a background of appropriate ideals. It is, therefore, the business of the school to develop ideals. Charters has formulated a very helpful plan for teaching an ideal of conduct. (1) Bring the desire into the focus of consciousness; (2) diagnose the situation; (3) develop a plan of action; (4) require practice or execution of a plan; (5) generalize the ideal or ideals involved. Let us apply these steps to a classroom situation. A teacher may be confronted by a class which is not exactly disorderly. The members of the class, however, have no conception whatsoever of courtesy as an ideal of conduct. They do not speak directly to the class when reciting; they interrupt their classmates and call out without permission.

The first step to be taken would be to focus the attention of the class on the desire for courtesy. This can be done by getting them to realize and admit that time is being wasted because of lack of courtesy. The teacher can then call for suggestions to remedy this situation. In the discussion that follows pupils would be guided to formulate a plan of action. Their part in the execution of such a plan should be especially stressed. After the plan has been in operation for several weeks, the class should be led to summarize the benefits that have resulted. The last step should then be an active application wherever possible of courtesy to other school situations.

When it comes to the development of proper habits which, like ideals, form a part of the basis of character, there are just one or two practical suggestions that I would like to make. Habits as related to character are most apt to be connected with classroom situations rather than with subject material situations. It is incumbent upon the teacher to watch for those golden moments in classroom situations in which strong incentives for the development of proper habits of conduct may be found. For example: five or

*A talk given before the teachers of Annex No. 1 of the Abraham Lincoln High School, one of a series planned by Mr. André Fontaine, head of this Annex.

Scanned with CamScanner

six pupils are habitually late to a recitation period. This condition presents an opportunity for the teacher to develop the habit of punctuality on the basis of a social need. Here is an important incentive which the teacher may employ. In addition, it is most important to remember that no teacher can implant a habit without specific preparation, which includes the choice of appropriate stimuli, the outline of the reaction desired, and the development of proper incentives and exercises to insure sufficient practice.

Very little is known about attitudes except that they are the by-products of experiences that take the form of preferences. These preferences frequently conflict with each other. The stronger ones determine the course towards which the will will be impelled. Professor Dewey states the case very well when he says: "Choice of an action is not the emergence of preference out of indifference, it is the emergence of a unified preference out of competing preferences." It is therefore the duty of the teacher, when the subject material or classroom situation permits, to emphasize very strongly those attitudes or preferences, if you will, that conform to social needs and standards, with the hope that by making these sufficiently strong they will propel the will into action in the right direction. The improper development of strong attitudes has in good measure been responsible for the failure of some of the teaching in citizenship. Tommy Jones has been taught that cleanliness is a worthy ideal, for many individual and social reasons. Nevertheless, Tommy will repeatedly wa through the corridors of the scho and fail time and again to pick up a of the litter he may stumble upon. H failure to react socially to this situ tion is most probably due to the fa that his attitude towards cleanlin has not been sufficiently developed overcome other conflicting attitud such as, perhaps, the fear of bei seen picking up the litter by one his fellow students who may label hi as a "goody-goody."

A strong attitude can usually be d veloped on the basis of a real ind vidual need strikingly brought to t attention of the pupil. I had a ve clear illustration of this fact in one my classes last term. Many of t boys in this class wore their sweate throughout the entire period. I quested them to remove their sweate and at the same time asked them state the disadvantages of weari sweaters in class. This method did produce satisfactory results. A numb of the students continued to wo sweaters. Shortly after this incid we began the study of bacteria. W inoculated various Petri dishes wi bacteria from different sources, su as air, water, food, etc., among wh were a sweater and a clean shirt. W grew the culture and I proved to class that the sweater bore many mo bacteria than did the clean shirt. Af this, I seldom had to remind any mo ber of the class that sweaters were to be worn in class. I also noti that, without much further effort my part, this same group which under my supervision during the fu period left the room in a much cleaner condition than they had heretofore done. In addition, I should like to add that I have a great number of these boys in one of my classes this term. The other day I checked up and found only three boys wearing sweaters. They were all boys who had not been members of this group last term.

The school can do very little directly to train the will because the will is functional in its operation and is an active outgrowth of our ideals, our habits and attitudes. There is, however, one practice sometimes carried on in classrooms related to discipline that tends to interfere with the proper operation of the will. I refer to the practice of giving negative orders, such as "Don't talk without permission!" "Don't look at your neighbor's paper!" In such commands the "Don'ts" recede to the marginal finger of consciousness and "talk" and "look" are brought into the focus of consciousness. Such commands should be given in positive form. "Speak only when called on." "Keep your eyes on your own paper." This should be done because it is simpler to carry out an action than to repress the tendency to action.

In conclusion, I wish to state that what makes character training so difficult for all teachers is the fact that the school, as it is at present organized, still dedicates itself primarily to the training of the intellect. If teachers were not burdened with the pressure of time, they might be able to accomplish more in the way of character training. We must, however, recognize the fact that moral conduct is the cumulative product of active experiences and it is the duty of the teacher if he wishes to train character, to take the time to present appropriate experiences with due reference to scientific procedure.

PROVISION FOR INDIVIDUAL DIFFERENCES IN PUBLIC SCHOOL HOME ECONOMICS CLASSES

I. INTRODUCTION.

THE SCOPE of this study will be confined to a discussion of policies providing for individual differences, and the possibilities of adapting subject-matter to the capacities of public school pupils in the home economics classes. The following questions are pertinent:

1. Why are we concerned about individual differences?
2. What evidence have we that is valid regarding the adjustment of individual differences?
3. What is the nature of differences in public school pupils?
4. What are some devices and methods that may be used to meet these differences?
5. What criteria should be our guide in adopting policies for individual adjustment in home

Scanned with CamScanner

economics courses that will also meet with the ultimate aims of education?

II. Why Are We Concerned?

During the period beginning with the World War and continuing up to the present, many significant changes have taken place in modern civilization which profoundly affect the activities of the individual. Machine production has created more leisure. Wealth and leisure combined have raised the standardization of the masses to a higher level of learning, with the result that the requirements for employment in all lines of work have been raised.

With mass instruction on a high level, the need arises for individuals as leaders in industry, in the trades, in the arts; for originality in music, in literature, and in the drama; for the differentiation of individuals as social and industrial assets.

The United States, being the "melting" pot that it is, has discovered by many years of experience that the influx of the peoples from foreign countries with differing racial characteristics, adds many desirable factors, and gives color, variety, and the interest of differentness.

Competition with foreign countries in all lines of human endeavor has created a demand for leaders, for the individuals who vary from the standard type and who attain ranking positions in athletic attainments, in invention, in commerce, in transportation, in designing in all of its branches.

The individual is relatively more of a personality than ever before.

Psychology, in its modern phases has centered public attention on the individual. Psycho-analysis emphasized complexes and inhibitions and pointed out individual differences due to inherited tendencies, natural geographical environment, man-made environment, and social inheritance.

The scientific attitude of questioning old theories has extended to all fields, political, religious, social and educational.

Whenever a rapid transformation of the conditions of living has taken place, the tendency has been for the curriculum to lag behind.

New movements do not originate in the public schools, but rather come as a demand from conditions and social pressure outside of the school.

With a social and economic demand for leaders, individualism was stressed as a life problem, and the schools reflected the thought by changing from mass instruction to the handling of individual differences.

Analysis of "the laws of learning" and "the thinking process," the realization that no two people are alike in mental capacity, and that living in the present is as important as preparing to live in the future, brought about a new conception of education, and a changing curriculum.

III. What Is Being Done to Adjust School to Individuals?

The rise of the junior high school was probably the outward manifestation of a recognition that elementary and secondary schools failed to fill the needs of the school child. For a time, its position was precarious, but science and psychology developed rapidly enough to analyze the objectives of the three types of schools and to state their respective aims clearly.

Professor Bonser says: "It is the purpose of the elementary school to provide experience in meeting the common needs of all, regardless of sex, vocation, or social status. As children develop individual capacities, as vocational interests make their appeals with more marked differences in response, and as the economic conditions of the home begin to make their influence felt, the wholly unified work of the elementary school must come to a close. The secondary school should provide activities meeting the needs of small groups or even of individual students. Individual differences and needs should be responded to in the full measure in which they exist. The junior high school marks a movement forward from the unified elementary school to the differentiated, departmental plan of the senior high school. It provides much greater opportunity for trying out in activities of individual interest."

The junior high school was a recognition that all students were not fitted by temperament or ability to follow the senior high school curriculum with profit to themselves or to society.

With the three types of schools, nearly all of the attempts to individualize instruction fall under two main heads:

1. Provisions for individual differences while retaining the class system of organization and method.
2. Provisions for strictly individual instruction.

Special experiments in both of the above divisions are briefly described as follows:

1. *Modern Batavia Plan.*

   This plan is commonly known as the "class-individual" method. Part of the time is given to class instruction, and part to individual instruction. Where the classes are very large, two teachers are used—a regular teacher for class, and a special teacher for individual instruction. The special teacher devotes her time to pulling up the laggards to normal standard.

2. *Ability Grouping.*

   The regular class is divided into three groups, on the basis of intelligence and achievement tests, with the judgment of the teacher as an additional factor in classification. These groups are known as (x), superior, (y), middle group, and (z), lower group. The (x) group—20% of the class—covers the regular subject matter of the grade in a shorter time and is given an enriched course in the subject; the (y) group—60% of the class—does the regular courses; the (z) group—20% of the class—are given a simplified course (minimal essentials).

Scanned with CamScanner

"Rapid advancement" or "retardation" classes are other terms applied to classes when grouped according to ability.

3. *Differentiated Assignments.*

This system of instruction provides for individual differences by allowing additional credits for all work done beyond the minimal requirements. In the Chicago University High School, some courses are organized into a number of units (14). All pupils are required to take the first ten units and are permitted to select two of the last four units. The superior pupils in a group take all fourteen units, after which they may take advanced work and receive additional credit.

4. *Pueblo Plan.*

Under this plan each pupil goes ahead just as fast as he can. It resembles the 17th century plan of instruction, when the teacher heard every pupil recite that portion of work that he had been able to prepare. The program is rather flexible and follows very much the common practice of kindergarten classes, on through high school.

5. *Strictly Individual.*

In this system the instruction is purely individual, each student developing according to his own ability and at his own rate of speed. The teacher's function is to help when needed.

6. *Socialized Recitation.*

Like the project method, the socialized recitation allows for individual differences. If organized as a club, leadership and executive ability have full play, while the routine worker falls into line on her own level of learning.

7. *Winnetka Schools.*

The Winnetka, Illinois, schools were the first public schools to undertake provisions for individual differences. Under the Winnetka plan each pupil may take as much time as he needs to master a unit of work. There are two parts to the curriculum:

1. Common knowledge and skills.
2. Self-expression—individual interests.

In both these divisions of work the pupil is placed on what might be termed "a piece work basis," instead of the usual "time work basis." No child ever fails at Winnetka, nor does he ever skip a grade. Pupils get the habit of mastering everything they undertake. The second part of the above divisions of school activities recognizes the "law of variation" as a factor in the full development of the child.

Other towns or schools have adopted and are using the Winnetka plan.

8. *Dalton Plan.*

The Dalton Plan was put into operation by Miss Parkhurst in a private school of her own. After successful efforts there, it was put into the public schools of Dalton, Massachusetts, from which it received its name. It is used throughout by several schools, the outstanding example being the Manhattan Trade School for Girls in New York City, and in part or in adapted forms by many other schools. Its outstanding success has been obtained in foreign countries. Notable among these are England and Russia, where Miss Parkhurst was hired to install the system.

The Dalton Plan provides for the individual three special features, namely:

1. Freedom in study.
2. Coöperation and interaction.
3. Time budgeting.

This system is commonly known as the "laboratory method" (see Prof. Johnson's article in "The Classroom Teacher"), or sometimes as the "contract method." All subject matter is given in the form of "contracts." It is an effort to make the life of the school correspond socially to life outside the school. Pupils are given freedom to work without interruption while pursuing a present interest. The method develops concentration. The system calls for individual promotion and graduation.

9. *Project Method.*

The project method is one of the best for taking care of individual differences. As it is a purposeful activity carried forward in a natural environment, each type of ability may find its level and develop from there as in a life situation. Reference work and outside assignments easily adjust to the individual without particular stress being laid on native deficiencies.

10. *Requirements and Electives.*

In high schools, individual differences are handled by means of required subjects and electives. Requirements are the minimum while electives are added as extras to the programs of the superior group.

11. *Number of Subjects.*

This is also a high school method of taking care of individual differences. A pupil of low or inferior intelligence is programmed for fewer subjects than the superior student.

12. *Variety of Courses.*

A variety of courses is a device used by high schools for taking care of individual differences. The classical or college preparatory course is often permitted to superior children only. Commercial courses, home economics courses, vocational courses are all prepared with an idea of differences in individual ability and interests.

13. *Special Schools.*

Special schools, such as vocational schools, trade schools, open air

Scanned with CamScanner

schools, schools for the blind, opportunity schools, evening schools, part-time schools, and Montessori schools have all been provided on account of individual differences.

14. *Extra-Curricular Activities.*

Many a child has shown his first real interest or leadership or skill through a school paper, an athletic contest, a hiking club or some other project which is not a designated part of the course of study. Clubs and organizations of pupil groups have a place in every school as a means of developing and taking care of individual differences.

This survey serves as representative of what is being done in different parts of the country in an effort to adjust schools to the individual. As to results, most authorities on the subject agree that

1. Ability grouping is only a halfway step and does not solve the problem entirely of adjusting school to individual differences.
2. Individual work does not save time for the talented pupils, or those who would normally be repeaters.
3. In Winnetka, an unusually large amount of time is devoted to group and creative activities.
4. The tendency of individual instruction does not seem to be so much toward getting children through school at an early age, as toward using the time saved for broader and deeper education.
5. Individual work increases efficiency in the tool subjects.
6. Individual work does not place an undue burden upon the teacher.
7. Individual promotions appear definitely to decrease retardation and corresponding over-ageness.
8. While individual work is an advantage to the superior student, lack of the audience situation has a tendency to slow down the already slow pupil.

The ideal adjustment of schools to the personal needs of individual pupils is far from being wholly realized. It is only in the beginning stage at present and, as Washburne expresses it, "the surface has only been scratched." The special interest in this survey is to inquire what provisions should be made for individual differences in home economics classes.

IV. Status of Home Economics Courses in Public Schools.

For the past thirty years, home economics has been recognized as a part of the regular school curriculum. It has been included in elementary schools for the seventh and eighth grades, sometimes even commencing as low as the sixth. In secondary schools during that time, it has varied from a requirement to an elective, depending upon the nature of the school. Unless it was a purely academic high school, some form of home economics was included. Teachers were specially trained in colleges, universities, and normal schools, not only in subject-matter, but in methods of teaching the subject as well.

Individual instruction as far as performance goes, during these years, has been a reality. The equipment for cooking classes has always been of the individual type, each student, for the most part, carrying forward her work alone from the measuring to the serving. All pictures of equipment in catalogues of the past show the hollow square table, with each student working at a one or two burner gas plate, the table with the lockers forming an individual kitchen. In sewing, each garment made by the student has been an individual performance.

While performance within the group was individual, the subject-matter for the group was uniform. The class, as a group, studied the same subject-matter for each term, regardless of the individual differences of students. Superior children have been grouped with the average or slow unless a system of ability grouping prevailed within the academic subjects. An intelligent teacher of home economics adjusted the work to fit individual differences in ability by adding executive, monitorial or inspectorial duties to the regular class work of the superior student. This amounted to differentiated assignments within the group. The home economics classes were labeled "special" as compared with the academic classes, signifying special subject-matter, special methods of teaching, special ways of performing and reacting by the students.

It is well to consider this in the light of the new requirements of education. Kilpatrick tells us that "to learn is acquiring new ways of behavior. Only as students practice thinking and choice and responsibility for results can they learn to think and choose and accept responsibilities. The best schools wish active purposeful work in their pupils. School activities must be linked with life activities."

Thorndike proved by repeated experiments that the study of sewing was as educative as Latin or mathematics.

Existing new developments in the principles of modern educational processes must be applied to the subject of home economics as well as any other course in the curriculum. The tendency to individualize instruction in the public schools should be applied to home economics subjects more easily and with less readjustments than it could be to other subjects. The advantages to be gained would be not only those that are common to the other subjects of the curriculum, but also those which are most vital in all home economics development—the cultivation of attitudes and appreciations.

Some of the most common objections to individualized instruction are that it is undemocratic in principle, that it would eliminate the opportunity for inter-action, that it tends to eliminate the stimulus that comes from group activity. These objections have already been partially answered, but there are other questions bearing on the general aims of democratic education which might be inserted at this

Scanned with CamScanner

point, and which concern home economics classes particularly.

1. In what proportion, if adopted in a public school, will the advantages and disadvantages of individual instruction in home economics vary if the number of pupils in a class increases?
2. While individual instruction may develop certain inherent talents, does the lack of the audience situation retard the development of certain social characteristics in the individual which are valuable in life?
3. How far can the advantages be increased and the disadvantages be decreased by improved technique in individual instruction?
4. Is the type of group activities used in the individualized schools effective in producing initiative?

V. What Is the Nature of Individual Differences?

Assuming that there is no question in regard to individual differences in temperament and ability among school children, we may proceed to find out to what extent these differences exist and to what extent they can be provided for in home economics classes. The work of Thorndike, Terman, Ruch, Crossman, Green, Gates, McCall, Otis, and others equally noted in measuring intelligence, achievement, and performance, have shown graphically the great extent of differences present in an average classroom of the public schools. There have been attempts made to devise measurement tests of ability as related to home economics fields, but as yet none of these has proved to be of any great value except in measuring a knowledge of facts or skills, and to a degree organization and judgment. Murdock, Trilling, Lucy Fulton, Grace McAdam and others have prepared and published home economics tests, as well as the home economics or research departments of Ohio, Illinois, Iowa, Minnesota; Wisconsin University and Teachers College has worked out some standardized tests in home economics subjects. But authorities are generally agreed that these measure only what they measure, and, by the very difficulty they encounter, prove the variability and range of differences inherent in individuals. The so-called standards of ability in cooking or sewing are by no means fixed or universally accepted as absolute, tangible measurements. A loaf of bread may be made according to a recipe and tally with the requirements for a good loaf of bread when baked, yet as compared with other loaves vary as to flavor. A dress may be made according to pattern with excellent sewing, yet lack the style, fit, and appearance to make it a desirable garment. The so-called tangible factor is only subjectively so, and therefore more or less a matter of judgment. If this is true, what hope is there of measuring, weighing, or rating the intangible factors or the unknown factors objectively? In associated and concomitant learnings lie the most vital part of home economics. But we are not so much concerned with the problem of measuring ability at present as we are in developing ability.

The class system of home economics instruction rarely provides for anything more than the so-called tangible element. If home economics were confined to mechanical doing, the recognition of individual differences would not be of serious import. Granting that home economics has a much broader scope in attitudes and appreciations toward citizenship, worthy home membership, ethical character, and right use of leisure, and since these functions of home economics training are intangibly different in each individual, it becomes necessary to provide for such differences in all home economics courses. The fact that in the average school home economics class we find a group of pupils of about the same age, does not signify in any sense that they have the same interests or ability. Age is no longer a sound basis for classification generally, and particularly not in home economics classes. In the light of what educational research has revealed, it becomes a responsibility of the schools to identify and provide for these differences. In every public school home economics class we may expect to find a wide range of differences in respect to the following:

1. Intelligence.
2. Talent.
3. Temporary interests.
4. Home background.
5. Special inheritance.
6. Biological inheritance.

Summarizing the effect of these differences in individual pupils upon their reactions to the stimuli of subject-matter and methods of teaching, the differences may hypothetically be reduced to interest, taste, and ability. In order to integrate these inherent differences, home economics courses should take into account, then:

1. The necessity of provisions for differences on the basis of interest, taste and ability.
2. The necessity for meeting such differences by
   a. Methods of teaching;
   b. Methods of class organization;
   c. Variation of curriculum.

VI. Some Suggestive Devices to Meet Individual Differences.

1. *Methods of Teaching:*

There is no need to point out how the class system in public schools fails to take into account the different interests, tastes, and abilities to any great extent. While this is perhaps not so true in regard to home economics as it is in other subjects, nevertheless it is a fault. In order to function economically, the public school is forced, in many cases, to march thirty or forty pupils of non-descript capacity into a classroom to receive home economics instruction. Under such circumstances, all individuality must necessarily be suppressed in order to make the machinery move. What exercises the class receives are rigidly standardized on the general assumption that all pupils of a certain class are "average pupils," whereas it is evident that no two could possibly be alike, even in the ability to measure. If two mem-

Scanned with CamScanner

bers of a class receive the same rating, it is no criterion that both pupils have made the same errors, nor that both have mastered an equal amount of subject matter, nor that one is not capable of going farther and deeper into a project than the other.

So long as human nature varies in individuals, it will be impractical to apply one system of teaching to a heterogeneous group of interests, tastes, and abilities, and expect to obtain their full development. A cast iron method of teaching presupposes a similarity of capacity which never exists in pupils of the average classroom. Unless the method is flexible in practice, it will tend to cramp and often destroy the very qualities it is intended to develop—charm, personal magnetism, the social qualities, doing motivated by intelligent thinking. The socialized recitation and the project method have helped solve the difficulties of individual differences in this respect. Dramatization, the pretending to be a family or to being grown up, with a kitchen of one's own, has always played a part in the teaching of home economics.

Unless a pupil is allowed to work a great part of the time by herself, she will never attain self-reliance or acquire ability to master a difficulty. The Dalton plan has its advantages. It supplies the personal stimulus necessary. It keeps the exercise from becoming mechanical. It allows for rapid advancement while taking care of the average and slow pupil.

Few subjects require better preparation of her lesson on the part of a teacher than does home economics. There is no subject in the curriculum whose separate lessons are so far reaching in associate and concomitant learnings. The emotionalized attitudes connected with the study of home economics condition and, to a large extent, determine the future responses of the student toward home and work within the home. No other subject is so closely linked with the personal and social life of the individual in the present or tends to cause such definite reactions in the future.

Theoretically the presentation, as to principles and methods, should be no different than those which govern good teaching generally. They should, however, in practice be more versatile in order to provide for the variation of individual capacity. Flexibility must be the foundation and the keynote—flexibility of technique to match variations of temperament and ability.

2. *Organization of Classes.*

Such provisions for individual differences in methods of teaching as suggested above need not interfere to any great extent with the regular organization of classes. The course of study, the program, the equipment, the grading and promotions should all be planned to meet the needs of the individual pupil. The general aim should be to give each pupil a chance to work up to the full measure of her capacity.

The public schools of Winnetka have done this quite successfully. They have modified their curriculum and administrative procedure to accomplish two purposes: to make greater adaptation to individual differences than is customary in public schools, and at the same time to provide for the desirable socialized and self-expressive activities.

Schools on the Dalton Plan have adapted the curriculum and administrative policies to individual differences. It is no longer a matter of experiment at the Brooklyn Industrial High School for Girls. Here 1,900 girls spend the time for two years on contracts in vocational work, including millinery and sewing trades, and cooking as a trade for all branches of cafeteria or tea room work. Individual enrollment, promotion, and graduation do not interfere with administration or curriculum making, nor detract from the social benefits derived as a member of a group.

The unit kitchen, the apartment, and the practice house have, for some years, helped home economics adjust to individual differences. While keeping the class organizations uniform with other school subjects, within the department, individual projects have trained for self-reliance and creative thinking. The apartment and unit kitchen provide opportunity for the superior and average student. The class kitchen is a means by which the teacher easily handles the slow or retarded pupils, or those having a low intelligence quotient. Separate sewing, cooking, and millinery rooms have helped handle the regular class organization while catering to individual differences.

3. *Variation of Curriculum.*

With new methods, new materials, new procedures and new ideas being constantly introduced in all branches of home economics, flexibility is not a new requirement. It has been a practice for many years in a general way. As compared with Latin or Geometry, its flexibility is obvious as to subject matter. Individual presentation is but a step farther.

The course of study in cooking and household management furnishes a variety of subjects. If the subjects are based on the needs of a community, according to the basic principles of education, a list would be almost endless. From such a list, it is not difficult to find material which is of value to differing interests and abilities.

It is evident, however, that the public school, with its restrictions, can not develop a pupil in all phases of home economics. It must concentrate on those elements and principles which are fundamental in the lives of all people. What class instruction has tried to accomplish, more or less, was to thrust this mass of material on every pupil, hoping that by the law of averages some would profit by it. By such a policy, gifted pupils are held back, while the non-gifted become discouraged by the competition.

With the fundamental principles of home economics thoroughly started in the primary grades, pupils should be allowed to progress independently of each other, according to their special interests, tastes, and abilities. Individual achievement should be the sole

Scanned with CamScanner

basis for advancement. A pupil should be rated on the units of work she has actually mastered, irrespective of what other members of the class have accomplished. She should be allowed to decide which branch of home economics she will select. No subject has within itself such a variety of vocations from which to choose. It is one in which women have been trained for centuries and allows the exercise of abilities ranging from organization, executive, and personnel work to that of the merest routine.

VII. Criteria for Judging Provisions.

The ultimate aims of education in a democracy must be recognized. The value of group activities as a desirable social element in education must be maintained to a certain extent in order to develop a sense of coöperation on the part of the pupil. The importance of this element has been recognized and provided for in most of the experimental plans reviewed at the beginning of this article.

Complete individualized instruction is out of the question, due to the present school organization which must take into consideration the cost per capita to the community and the time element as related to the school day and age of the individual. Aside from these considerations, it would eliminate the stimulus that comes from group activity.

The nearest approach to a practical demonstration providing for individual differences, while at the same time retaining the best features of the class system, is a combination of both as described in the Batavia plan. In this plan the group stimulus is preserved and at the same time ample provision is made for explicit individual instruction.

A factor in evaluating provisions for individual differences is the psychological change which takes place during the development of pupils. The same policy can not apply to kindergarten and high school pupils. This has already been recognized in the organization of the school system, according to the natural divisions of the levels of learning. The most critical period in respect to psychological changes is the junior high school age, when the interests, tastes and abilities of pupils require a greater scope of outlet. The Dalton plan functions at this period with notable success. The provision of exploratory courses in junior high schools tide the individual over the time of difficult adjustment between childhood and the learning of a vocation as an adult.

VIII. Conclusions.

If home economics is to maintain its place in the curriculum in the public schools, it must meet the social and industrial needs of the community. The trend of modern social and industrial influences raises the status of the individual to a greater sense of freedom than ever before. Psychology has demonstrated that individual differences must be taken into account if the full development of the pupil is to be attained.

In a large city like New York, where the great problem is to "provide a seat for every child," any attempt to individualize instruction in academic subjects would be hampered by numerous modifications of the theory. But, as far as home economics instruction is concerned, results to date are probably more favorable than in any other subject in the curriculum. Inasmuch as individual interests, tastes and abilities are recognized in the divisions of the subject within the curriculum, in class organization, in equipment, and in methods of teaching, individual differences are provided for far in advance of the present trend.

The tendency in education to break away from subjects and to correlate information around "centers of interest" points to home economics as an important center of interest to differing individuals. The family has always been a group of individuals differing in age, interest, ability and sex. Each has an interest in geography as related to foods, textiles, building materials, and travel. History centers around the home both in peace as to the development of utensils, architecture and industries, and in war, which is usually for the purpose of protecting the home. Civics certainly enters in the home. "A nation is no stronger than its homes." Of what use is English? To communicate with our families our employers, our friends, our co-workers. Vocations have directly to do with the support of a home. The home then should be one of the important divisions in the new curriculum, attracting and holding the interest of many differing individuals.

Grace J. Ferguson.
Brooklyn Industrial High School for Girls.

CLUB WORK AND ACTIVITIES IN THE FIELD OF GERMAN*

Club work in the modern foreign language field requires no brief. Its desirability is unchallenged. It is a vital force in equipping a student for the more abundant life because it brings to him those experiences which the home school cannot provide and because it helps to answer the question, "How am I to spend my leisure?"

This great merit of the club and the activities which it sponsors and encourages can only issue, however, if the club reflects the interests of the student-members. The writer of this article sponsored the German Club in Bryant High School, was its faculty adviser during its first seven years, and then, after an interim, acted in that capacity for another year. Therefore she offers not theories, but the fruits of personal experience.

The language club is only an adjunct to the main business of language

* This is one of a series of articles on "Club Work and Activities" and "Music" prepared for use in the teaching of the different modern foreign languages.—Editor.

Scanned with CamScanner

teaching. The faculty adviser must be only a guide when guidance is asked, not the motive power. Not what the faculty adviser wishes, but what the boys and girls themselves desire, must determine the club programs. The club will be successful only to the degree that the students, not the teacher, initiate projects and assume responsibility. Teacher-imposed activities become a task; self-imposed tasks, a joy. And without this joyousness, this glow of pleasure, no helpful attitudes will be carried over into adult life.

What of the faculty adviser? Has she nothing to do except to be present at the meetings as a chaperon? Decidedly. The faculty adviser must be a teacher who firmly believes in the benefits of extra-curricular activities, who has great affection for and sympathy with young people in general, who loves teaching and especially teaching the language whose club needs guidance. Then this teacher must know just what sort of club she wishes to advise. For with careful guidance, well-defined principles may be followed without the sponsor appearing too much in the foreground.

Let me be very specific. When our German club was organized, I knew that I wished to take the group out in quest of those experiences which could not be offered within the home school. The question of size immediately assumed importance. For myself, I knew that thirty-five was the largest number for which I was willing to assume responsibility. For we had a typical German picnic each semester; we visited the museums, the old Irving Place Theater, art shops by previous arrangement, Columbia University with its occasional special exhibits, statues and monuments pertinent to our field. With more than thirty-five young people, I should have felt like "the old woman who lived in a shoe." This desire to go afield in order to enlarge our horizons was the determining factor. Had we limited ourselves to the meetings within the home school, more boys and girls could have been welcomed. We met twice a month—I believe that is the ideal number of meetings. We had talented members who played the piano so that the club rejoiced in song; there were frequent open meetings to which all students of German were welcomed and many at which other clubs in the school were the guests of honor. Many of the faculty also attended our open meetings. One rule from which no deviation was permitted was that there should be only one meeting a term at which refreshments were permitted. (You see the faculty adviser must do the braking). At this meeting the parents were welcomed.

The club permits students to meet in an intimate and social atmosphere with others of like interests. Will this intimate, social atmosphere be heightened by compulsory use of the foreign language? I doubt it. But I do believe that routine matters of procedure may well be carried out in the foreign tongue. Then the nature of the program, as interpreted by the participants, must determine the later course of the meeting. For the club must be a forum where the club members can

ride their hobbies. And if the limitation of language makes the road rocky, then the young people simply will not ride. The program must neither be over the heads of the participants, nor must it play down to them. Some will bring their treasures in German, but others must be permitted to offer theirs in English, or they will not offer them at all.

I offer some suggestions both relative to bibliography and to activities:

1. *General Bibliography*

Blackhorn, Laura: Our High School Clubs. The Macmillan Company, 1928.

Cole, Robert D.: Modern Foreign Languages and their Teaching. D. Appleton and Company, 1931.

Draper, E. M. and Roberts, A. C.: Principles of American Secondary Education. The Century Company, 1932.

Foster, C. R.: Extracurricular Activities. Johnson Publishing Company, 1925.

Fretwell, E. K.: Extra-Curricular Activities in the Secondary Schools. Houghton Mifflin Company, 1931.

McKown, H. C.: School Clubs. The Macmillan Company, 1929.

Schirmer, Mariele: "Bibliography of Articles on German Clubs." *Monatshefte*, Vol. 20, March, 1928.

"The Significance of the Modern Language Club." *Modern Language Journal*, Vol. 7, November, 1922.

2. *Special Bibliography*

J. A. Hess: "A Guide for German Clubs." *Modern Language Journal*, Vol. 11, January, 1927. Reprints are procurable from Professor Hess at Ohio University, Athens, Ohio; price 30 cents.

Young, Caroline M.: "The German Club." *Modern Language Journal*, Vol. 1, March, 1917.

Both of these articles suggest a suitable constitution with the necessary formulae for conducting the meetings in German.

3. *Games*

Professor Hess's article also lists twenty German conversational games. Many conversational games played in the students' own homes may be readily adapted to the foreign language. In addition to conversational games, there are many suitable "Quartett" games such as:

Bunte Blumen.
Tier-Quartett.
Die Weltstadt Berlin.
Dichter-Komponisten-Zitaten-Wagner-Quartett.

For beginners, the "Do you speak English?"-Quartett is fun.

These and many more may be had at B. Westermann Company, Inc., 13 West 46th St., New York City.

E. Steiger and Company, 49 Murray Street.
B. Westermann Company Inc., 13 West 46th Street.

Scanned with CamScanner

No list given is complete; omissions are no reflection upon the firms not mentioned.

At Bruderhausen's a very complete assortment of German calendars is available.

5. *Libraries*

In its circulation department the New York Public Library, Fifth Avenue and 42nd Street, has a very large collection of German books, including many of the most modern ones. Most of the branch libraries of the N. Y. P. L. have small German collections and all will borrow books desired by a reader.

There is also a "Leihbibliothek" at the "Foreign News Depot" in the Times Square Building, entrance at the corner of Seventh Avenue and 42d Street, where the current literature of Germany may be rented at a very nominal fee.

But books in English about Germany, Germans, German life, music, art, and history are undoubtedly of greater value to the young student than those in the German language. And all libraries have these.

It is also important that every school library have an interesting collection of such books as well as of superbly illustrated books. For the pictures make an appeal more potent than any text.

Among others I recommend:

Die Blauen Buecher (many titles).
Der Eiserne Hammer (many titles).
Seemanns farbige Kuenstlermappen (many titles).
Schaubuecher.
Geographical Monographs.
Baedeker: Deutschland. (This is a veritable mine of information and inspiration for the teacher.)
Ganghofer, Ludwig: Hochland-zauber.
Kurt Hielscher: Deutschland.
Kurt Hielscher: Austria.
Presber: Das Deutschland-Buch.
Roch, Carl O.: Die Alpen rufen!
Baker, Suzanne H. Barbe: Wayfarer in Bavaria.
Danton, George H.: Germany Ten Years After. (For older students.)
Diesel, Eugen: Germany and the Germans.
Jais, Regina: Legendary Germany. Oberammergau and Bayreuth.
Letts, Malcolm: Wayfarer in Central Germany.
Letts, Malcolm: Wayfarer on the Rhine.
Mac Kinder, H. J.: The Rhine, Its Valleys and History.
McBride, Robert Medill: Towns and People of Modern Germany.
Millet: Danube.
Peck, Ann Merriman: Young Germany.
Schauffer: Romantic Germany.
Schoonmaker: Come with me through Germany.
Shuster, George N.: The Germans. (For older students).
Untermeyer, Louis: Blue Rhine-Black Forest.

6. *Music*

Huncke, George D.: Music in Germany. HIGH POINTS, June, 1931

In this field we are particularly favored. Not a day but what radio programs offer good German music. Throughout the season, the daily newspapers publish pictures and programs of musicians appearing on the concert and opera stage; the recitals and operas are reviewed; and the opportunities for first-hand knowledge of German music are legion. The pupils will be happy to coöperate in gathering this material.

The Inter-City High School Club which meets Saturdays throughout the season is a potent agency for fostering an interest in German song and also in German instrumental music.

Then at all shops where phonograph and victrola records are sold, the catalogues list those suitable for club work, ranging from Beethoven symphonies to "Du, du, liegst mir im Herzen."

Records remind us that the Linguaphone Institute, 10 East 43d Street, New York, has excellent records spoken by Dr. Erich Drach, Berlin. These are beautiful models of diction and phrasing and range from "Die Lorelei" to "Die Drei Ringe" aus "Nathan der Weise." These may be effectively used in club work.

The libraries all circulate books about German music.

Suitable for use in German Club are the following:

Fidelitas.
Humperdinck: Sang und Klang fürs Kinderherz.
Heribert und Grüger: Liederfibel.
Volksliederbuch fuer die deutsche Jugend.
Von rosen ein kreutzelein (Blaue Bücher).
Alte deutsche Volkslieder.
Zupfgeigenhansl.

7. *Travel Pictures, Talkies, Lantern Slides*

The commercial houses offer many "talkies" daily, since there are more than a half dozen which present only German films. Many of the neighborhood houses also offer German "talkies" and the International Cinema League, 11 West 42d Street, New York, is coöperating with the Director of Modern Languages in the senior high schools in offering visual-aural instruction. The present offerings in the field of German greatly exceed those in other language fields.

The American Museum of Natural History has available for school use a few films such as:

Across the St. Gothard Alps, two reels.

Austria: Winter Sports in, one reel.
Hamburg, two reels.

North Sea: Over the Sunny, two reels.

The Hamburg-American Line, 39 Broadway, has films which it will not lend for school assemblies, but it may send an operator to show them before clubs, particularly if adults are in the audience. Each request will be considered on its own merits.

The same is true of the *German Railroads Information Office*, 665 Fifth Avenue, which also has beautiful slides. But both of the above are most generous with their pamphlets. Throughout this Goethe Year both

Scanned with CamScanner

have supplied illustrated Goethe material in great quantities for use in the schools, and the German Railroads Information Office gladly gives beautiful posters to the teachers for classroom display. *The German Tourist Information Official of the North German Lloyd*, 57 Broadway, is also very helpful.

The Carl Schurz Foundation, 225 South 15th Street, Philadelphia, has a six-reel film depicting Goethe's life.

The Metropolitan Museum of Art will lend lantern slides from its collection, which includes material illustrative of German architecture, sculpture, paintings, crafts, etchings, engravings and woodcuts.

There are many reels of travel film taken by teachers and their friends which can undoubtedly be made available to the students of our schools. But since in each case this borrowing would be a personal matter, it behooves those interested to locate this rich material.

Then there are the commercial travelogues of Branson De Cou, Burton Holmes, and E. M. Newman, to which attention may be called.

8. *Museums*

The Metropolitan Museum of Art offers great treasures.

In the Architectural Hall may be found a model of the Butchers' Guild House in Hildesheim (1529), a replica of Peter Vischer's Monument of St. Sebald in Nuremberg, and a construction of Nuremberg as it appeared in 1625.

There is also a charming Swiss room. There are wood carvings, metal work, crystal vessels, ivory carvings, stained glass, ceramics, sculpture, armor, engravings, etchings, woodcuts, and lithographs.

In the field of painting there are examples from the early period up through the art of Dürer and Holbien to the moderns, Arnold Böcklin, Franz von Lehnbach, Hans Thorna, and Max Lieberman.

We have already referred to the lantern slide collection, and mention must be made of the privilege of having guides to take groups to study exhibits in any definite field of interest.

The Brooklyn Museum of Art

The Brooklyn Museum has many German paintings ranging from Lukas Cranach through Arnold Bloecklin, Franz von Lehnbach and Fritz von Uhde to Franz Stueck. It also boasts old German furniture, and its curators will be happy to arrange lectures to be given at the Museum illustrated with its lantern slides of Hildesheim, Cologne, and Nuremberg

The Museum of Modern Art, 11 West 53d Street, has had one exhibition of current German art.

The Roerich Museum, 310 Riverside Drive, has had several lesser but very significant exhibits.

The Grolier Club invited the public to a very interesting display.

Columbia University, as a part of its contribution to the Goethe Year, offered the public the opportunity to visit a very fine collection of Hauptmanniana which was exhibited in Avery Hall.

Even a casual reading of the newspapers will disclose the temporary quarters at which German art may be studied. For every commercial gallery has potential importance from the museum standpoint.

9. *Monuments*

"German Realia," Report of a committee consisting of Pauline M. Sesso, Chairman, Alexander O. Bechert, J. B. E. Jonas, and George J. Lenz. HIGH POINTS, Vol. 6 No. 1, January, 1925.

In 1859, in commemoration of the hundredth anniversary of Schiller's birthday, the Germans presented to the city statues of Goethe, Schiller and Mozart, which adorn the Mall in Central Park. Since that time the number has grown apace, and again has the city acquired a bust of Goethe, the gift of the Goethe Society of America, unveiled in Bryant Park, November 26, 1932.

10. *Realia*

Our very large German population has so greatly influenced our daily lives that a list of realia is superfluous.

The Christmas season proclaims the German influence with its trees, its Lebkuchen and Spruengele, its toys from Nuremberg, its tinsel ornaments.

Easter too is eloquent with its Easter bunnies and gaily colored eggs. But in our daily lives, from the aluminum saucepan from the 5-and-10-cent store, which is used in preparing breakfast, to the evening crowned by the glories of Wagnerian opera, German crafts and arts are intertwined with the very stuff of life itself.

11. *Periodicals, Newspapers*

The *Deutsches Haus* at Columbia University probably receives a greater number of German newspapers and magazines for the general reader than any other institution in the United States. These may be read by the visitor.

The *Foreign News Depot* in the Times Building at Seventh Avenue and 42d Street has a large selection of the best German dailies and magazines.

The News Stand at the 5th Avenue Station of the I. R. T. on 42d Street near 5th Avenue also carries a large selection of dailies.

Das Deutsche Echo, which may be ordered through the Board of Education, is making a conscious effort to appeal to the American boy and girl of high school age. It is issued monthly except July and August.

Deutsch-Amerika und Sport Rundschau, published weekly by the Staats-Herold Corporation, is of undoubted interest to our boys and girls.

Die Woche and Velhagen and Klasings Monatshefte also contain much that will interest our older language students.

The *National Geographic Magazine* often has valuable articles such as:

Dinkelsbuehl, Romantic Vision from the Past, December, 1931.

Tyrol, The Happy Mountain Land, March, 1932.

Styria, a Favored Vacation Land, October, 1932.

In honor of the Goethe year *The Connoisseur with International Studio* published "Shades of Goethe," illus-

Scanned with CamScanner

trated with many shades, i. e. silhouettes.

Alertness will seize upon suitable material as it presents itself in our magazines from time to time.

The German teacher will find professional inspiration in keeping abreast of such special magazines as:

Modern Language Journal
German Quarterly
Germanic Review
Monatshefte fuer deutschen Unterricht
Modern Language Forum

12. *Maps*

Dennoyer-Geppert Company
Rand-McNally
Eduard Gaeblers: Schulwandkarte von Deutschland, der Schweiz und Oesterreich
Dietrich Reimers Werbe- und Verkehrs-Karte des Deutschen Reiches fuer Handel and Industrie

The *German Service Bureau* of the University of Wisconsin is only too happy to assist teachers of German relative to any professional matter.

13. *Suggested Club Activities*

1. Singing German Songs.
2. Book exhibits in the school library.
3. Calendar: Preparation of German.
4. Celebration of birthdays of great Germans, and of German festivals.
5. Dramatization of stories read by members of the club.
6. Historical studies of Germans and of German-Americans.
7. Music, Instrumental (this may offer an entire program, or may contribute to a program).
8. Names, Meaning of Family (this search for meanings will prove fascinating to some pupils).
9. Plays; an ambitious group can easily present more than a one-act play. The plays must be neither too difficult nor too childish. The holidays offer inspiration for original community plays. It is not necessary for all of the characters to speak German. This bi-lingual feature broadens the appeal. And, therefore, some years ago the German Club of Bryant had a hilarious time with our own Mark Twain's three-act "Meisterschaft."

The German book stores can assist in offering plays, but the *German Service Bureau* of the University of Wisconsin, mentioned above, can undoubtedly prove more helpful than any other agency.

10. Post cards (these awaken great interest and enlist many contributors; they may well be limited to a given part of a German speaking country for any one meeting).
11. Publication of German page in the school paper.
12. Science (socialization of the club will give scope to interests of the students, and he who has a scientific hobby will wish to talk upon that one which engrosses him; there may even be demonstrations).
13. Stamps (collections may illustrate German geography, history, great men, etc.).
14. Statues and monuments of Germans and to German-Americans (locating these will be an interesting neighborhood project).
15. Talkies, German language.
16. Travel talks, illustrated. (These may be given by a student who has been abroad, or by a member of the faculty.)
17. Trips to:

Art Museums and Galleries.

Deutsches Haus at Columbia. (On this visit the faculty adviser should take the group to the Carl Schurz monument at 116th Street and Morningside Drive.)

German landmarks in our Community.

Libraries with German collections.

Monuments to Germans and German-Americans.

Parks named in honor of German-Americans.

Schools named in honor of German-Americans.

Special art Exhibits.

18. The Bulletin Board. This should be an educational influence in directing attention to matters of current information, in presenting Kulturkunde, and in implanting the desire for first-hand knowledge of the finer things that will enrich the present and so make possible a spiritual life aglow with the radiance of German thought, German art, and German music.

MYRTLE J. JOSEPH.
Bryant High School.

GRAPHS AS AIDS TO INDIVIDUALIZATION AND SOCIALIZATION OF PUPILS

CULTIVATION of effective habits of work in pupils was considered so important a factor in furthering the aims of secondary education—individual development and social efficiency—that two days were set aside last fall for conferences on that topic for New York City high school teachers. It was a most useful procedure and no doubt many carried away plenty of food for thought.

Good habits of work, like all desirable habits, in order to become ingrained and be made permanent, should be established as early in the life of the individual as possible. By the time the pupil reaches the high school grade he is already equipped with habits, useful, indifferent or slovenly. Unfortunately many students do enter the high schools with poor habits. It would appear, then, that the training for the acquisition of effective habits should begin early in the elementary and be emphasized throughout the lower grades. But, having these students with us in high school, what can we, in the classroom, do to make them unlearn their poor habits of work and take on more desirable ones? Perhaps the following experiments may prove helpful as one of the means of stimulating greater endeavor.

Scanned with CamScanner

At the beginning of the September, 1932 term, every student in my classes was asked to keep a graph of the marks he obtained in all full-period tests and in the midterm examination —a sort of record of achievement. There were two classes of Biology I and three of Biology II. The purpose of these graphs was to have the pupil draw some concrete picture of his progress which he must necessarily look upon everytime he enters his mark. Without some such record he soon loses track of his progress.

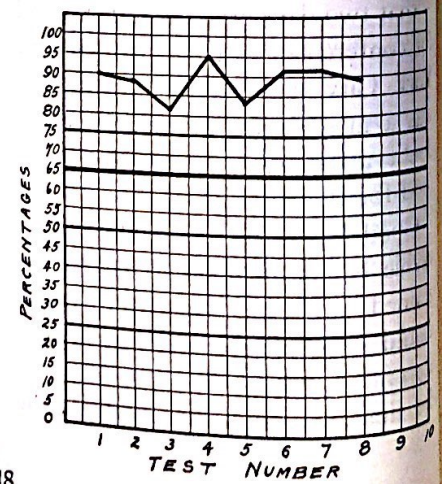
These tests were given at the conclusion of each "unit" of work and were uniform for all classes of the same grade. At first these tests were announced, but the pupils soon learned to expect them when the unit was completed. The examination questions were necessarily factual, but there were also many of the so-called "thought-provoking" kind. The students were held responsible for all subject matter presented in class and studied from the text-book. For home-study pages were never assigned; this required additional self-reliant work, if the pupils were to obtain good marks in the examinations, as the text-books now in use at our school do not follow the order of the new biology syllabus. The aim of these procedures was to develop better habits to study and work.

I thought, at first, that all this would serve as sufficient incentive for the pupil to attain marks of a high level, but the results of the first three tests were not encouraging. On the fourth, the mid-term, the pupils, in general, did very poorly. I thought I would appeal to that sense of rivalry which is so strong in youths of adolescent age. Without disclosing any individual marks, I announced the relative rank which each pupil obtained in his midterm examination; that is, the pupil of highest rank first, next highest second, and so on down to the lowest and last. The reaction was remarkable. They received the idea enthusiastically. It gave the whole thing the semblance of a game. When put to a vote it was overwhelmingly decided to follow this procedure in all future examination. Thus the coöperation of a large number of pupils was obtained.

A study, at the end the term, of these graphs showed a general improvement of the work of most of the pupils *after* that mid-term examination. Other findings are as follows:

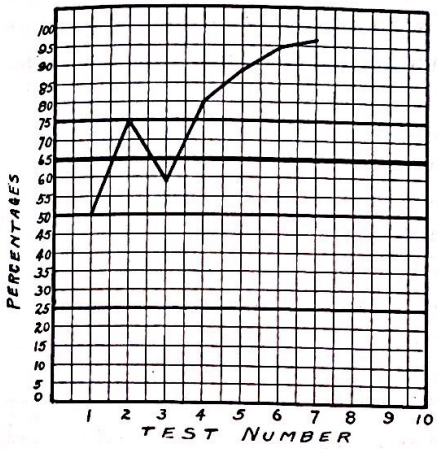
1. The very bright pupil does not need this additional stimulus. He maintains his high average level of marks (Graph I), and often, but not always, ranks first in each of the several tests.

GRAPH I



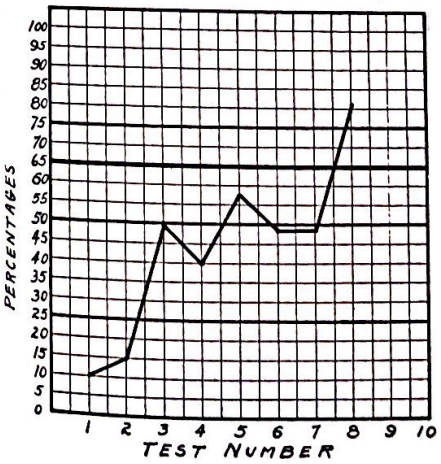
2. The average pupil is benefited by this additional stimulus; there is a decided effort to rank first or very high. He often succeeds. Graph II, is typical of a large number of such cases.

GRAPH II



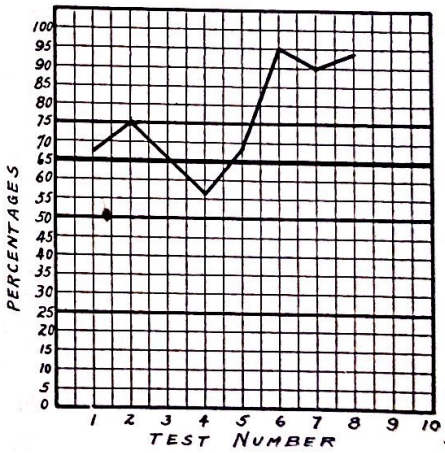
3. The poor and even failing students also show a reaction to this stimulus. There are some students in every class, who, because of mental incapacity, seem impervious to any stimulation, and we have some here. Graph III represents the work of a failing pupil, but there is no doubt of his tendency to climb upward.

GRAPH III



4. Graph IV is that of a boy who gave every evidence of laziness and recalcitrance. He came unprepared almost daily, kept a negligible note-book, often left his pen and pencil home, and showed little interest in his class work. The idea of announcing the rank appealed to him immensely and he boasted that he would outrank the others in future tests. He kept his promise. He made two firsts and one second.

GRAPH IV



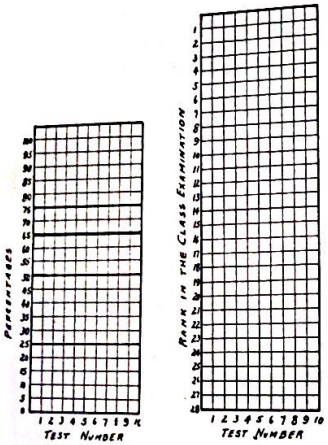
5. Comparison of the graphs of the first and second term students shows better response from the latter.

Although the results were very encouraging, they were far from conclusive. These experiments are being repeated this term in my four classes and in five of another teacher who has consented to coöperate. In addition to keeping the graph of his marks, the

Scanned with CamScanner

student now also keeps a graph of his rank (see Graph V). Another innovation in my four classes is the posting, on the front wall of the classroom, of large scale graphs which record the average marks obtained by each class on each of the examinations. The records of the two Biology I classes are kept on one chart and those of the Biology II classes on another. Thus competition between classes of the same grades is set up. The last idea again received hearty support by vote of the classes.

GRAPH V



To ascertain whether or not the general intelligence of a pupil bears any relationship to this method of motivitating the student to greater efforts, a record of his I. Q. obtained in elementary school is kept, but not divulged to the student.

Thus, by having each student keep an individual record, and also by having each class keep a chart that establishes class rivalry, means are provided for both the individualization of effort and for the development of that social consciousness—to do something for the welfare of his class—that "gregarious nature," characteristic of adolescence, of which A. A. Douglas speaks. It is hoped that the individual rivalry established will lead to the development and maintenance of leadership in the bright pupils and awaken similar desires in the mediocre ones; and if, for the dull pupils, it does nothing more than to stir them to greater efforts and to change their attitude toward school work, the extra labor and time involved in keeping these records will be well spent. It is further hoped that by carrying these experiments through future classes a simple system will be evolved which will be of service not only in biology classes, but in those of many other subjects.

J. P. BENSON.

New Utrecht High School.

HIGH POINTS

The Science Zone Meeting in the John Adams High School

On the afternoon of November 18, 1932, there was held at the John Adams High School of Ozone Park, L. I., what the writers believe to be the first demonstration science zone meeting held on a borough-wide scale. This meeting, at which eight Queens high schools were represented, was the first of a series of programs being sponsored throughout the city by the American Institute in connection with the Junior Science Club movement.

Although not deliberately planned as an "experiment," many characteristics of the event were experimental in their nature. The only previous meeting that might have set a precedent for this one was a city-wide science demonstration held on October 29, 1932, at the American Museum of Natural History. Since our group of about one hundred persons was only one-tenth as large as the group present at the museum, the two meetings differed greatly. The museum meeting consisted of the announcement of the history and aims of the Junior Science Club movement, by Dr. Morris Meister of the American Institute, and a series of demonstrations in chemistry, biology, and physics by Dr. Baker, Dr. Riddle, and Mr. John Clark, respectively. It was possible for the zone meeting, however, to be more informal.

In response to the invitations sent out two weeks before, groups of visiting students, teachers, and chairmen began to arrive at about half-past three. A reception committee of four members of the John Adams Physical Science Club escorted these groups to the physics laboratory where ten pieces of apparatus, most of them unusual and student-made, had been set up. The student assigned to each set-up demonstrated and explained the physical principles involved in his experiment. The following were the ten experiments shown: the production of liquid vortex rings, with mention of their past association with atomic theory; sensitive flames that quivered in response to whistling or the jingling of keys; sympathetic pendulums that alternated in the picking up of the motion of each other; the thermo-electric magnet that acted as a magnet only when its parts were properly heated; an X-ray tube that, with the aid of a fluoroscope, enabled the observer to examine the contents of unopened pocketbooks and to see the bones of the hand; the wiring of a system for turning on or off the lights in three rooms from any one of these rooms and still making it possible to turn them all on or off from any other of the rooms; the simple two-way telegraph line permitting communication across the room; the intermittent siphon that delivered a regularly inter-

Scanned with CamScanner

rupted flow of liquid; the effect of static electricity on a thin stream of falling water; the beat effect as usually demonstrated with resonant tuning forks and r.ders. Genuine interest seemed to be shown in these exhibits.

The formal demonstration part of the program began at four o'clock in the physics demonstration room of the school. The principal of the John Adams High School, Mr. William A. Clarke, in a brief talk, welcomed the visitors and expressed the hope that more meetings of this nature would be held in the future, not alone in the sciences, but in the other high school fields as well. Mr. Alexander Efron, chairman of the Physical Science Department, then proceeded with a series of demonstrations.

The first demonstration made use of the expansive and cooling properties characteristic of liquid air. To show the expansive effect, liquid air was used to inflate a balloon and to blow a cork out of a cylinder into which some of this air had been put. Next, the effect of this material on meat, frankfurters, flowers, and rubber was shown. The meat could be "sliced" with a hammer; the frankfurters "cracked" apart upon being dropped to the floor; the soft petals of flowers became brittle and crumpled to bits in the hand; sheet rubber and rubber tubing lost their customary elasticity and became hard, rigid materials. Since the temperature of liquid air, about -190° Centigrade, is much lower than the freezing point of mercury, -39° Centigrade, a "hammer" was made by freezing some of this metal in a pan filled with liquid air. The mercury was poured into a small match-box and the handle held in place until the solidification was complete. After the sides of the box had been stripped off, the hammer was used for driving nails into a wooden board. Again, the relatively high temperature of ice with respect to that of liquid air was made use of in boiling some of this liquid in a kettle standing on a cake of ice. At this point, Mr. Johnson of the Far Rockaway High School volunteered to show that liquid air could be held in the mouth for several seconds with no observable ill effects. The last experiment in this group was performed by saturating some cotton tied on the end of a long wooden rod, with liquid air. After a pause of about one minute to permit some of the liquid nitrogen to evaporate, leaving an excess of oxygen, the torch was ignited. A very violent and spectacular burning took place.

The next series of demonstrations dealt with the effects and uses of the stroboscope, an instrument for throwing intermittent light upon a rapidly rotating object. By varying the frequency of these light flashes, it is possible to make the rotating disc or wheel appear to go forward slowly, to stand still, or even to reverse its direction of rotation. Several discs, previously prepared, were examined while in motion with the stroboscope. On one disc, rings of concentric circles appeared to be going in two directions at the same time. A model of a flywheel was also examined in this way to illustrate the use of the stroboscope in detecting flaws in machinery that could not be detected when the machine was not in use.

The last demonstration made use of the selenium type of photo-cell for turning on and off electric bells and lamps. In series with the cell was a group of fourteen dry cells and a sensitive relay. As a light fell on the selenium cell, this relay closed a local circuit consisting of several dry cells and a bell or a bank of small flashlight bulbs. Mention was made of the three types of photo-cells, the photoelectric, the photovoltaic, and the photoconductive, and of the ever increasing number of uses to which these instruments are being put in commerce and industry.

At the conclusion of this portion of the program, two members of the John Adams Physical Science Club, Walter Hausz and Herbert Schwartz, presented a short program of chemical magic dealing with some peculiar characteristics of "water."

The group was then conducted to the science exhibit case just outside of the chemistry office where a photo-electric cell operated an electric lamp placed on an open plate. Since no wires could be seen leading up to the lamp, the problem as to why the lamp glowed whenever light fell upon the photo-electric cell, was left to the visitors for their solution.

While the group was still operating the exhibit, tea and crackers were served in the chemistry office and in the corridor near the exhibit case. At the conclusion of this, the last item on our program, the meeting ended and the group disbanded.

The following high schools of Queens were represented at this meeting: Newtown, Richmond Hill, Jamaica, Far Rockaway, Bryant, Flushing, Grover Cleveland, and John Adams.

Among those present were Dr. Morris Meister and Miss Catherine Emig, representing the American Institute, and Mr. Abraham Dick and Mr. Edwin Barnes, heads of departments at the Grover Cleveland and Far Rockaway High Schools, respectively. The entire department of the John Adams High School was present and assisted in the program.

The cost of liquid air and of other materials used in the course of the demonstrations was taken care of by the appropriation given to the John Adams Physical Science Club from the General Organization fund of the school.

We feel that all those who were present at this "experiment" received immediate and tangible benefits from this association with new ideas and experimental techniques. And if there was a renewed determination to try out some of the things shown with the view of extending the ideas and perfecting the techniques still further, the writers feel amply rewarded for having undertaken, in their own way, to help strengthen the experimental frame of mind and build a lasting interest in science.

ALEXANDER EFRON,
EDWARD ECKSTEIN,
John Adams High School.

Scanned with CamScanner

The Inculcation of Tolerance Through Modern European History*

This lesson is presented with an appreciation of its inherent weakness. It is the belief of the writer that tolerance may be learned but not taught, either directly or indirectly, except over long periods of time. Tolerance is the result of maturity and wisdom. If tolerance be inculcated, as is usually done in history classes (and also in the lesson outlined below), by showing the disastrous effects of intolerance, the result is inadequate. While it points out the inexpediency of intolerance in certain specific cases, it fails to dissociate the two concepts. It is only in the hope that the multiplication of such incidents may aid the student in the transformation of a particularized state of mind into a conviction of the value of tolerance per se that the following lesson may be justified.

Topic:

Nationalism in the Austro-Hungarian Empire.

Objectives:

1. Ultimate: to inculcate the ideal of tolerance.
2. Immediate: to show the effects on the Austro-Hungarian empire of racial intolerance and the suppression of nationalist aspirations.

* This is the second in a series of articles designed to show specifically how the classroom teacher attempts to realize the objectives of history teaching.—Associate Editor.

Materials:

1. Text-book account, e.g. Hayes and Moon, "Modern History," pp. 603-613, 770.
2. Statistical and other reference material bearing on the problem of nationalities.
3. The text of one of the post-war Minorities treaties.
4. Maps—political, racial, linguistic.

Procedure:

Problems presented by teachers; open text-book investigation of problems and socialized discussion of solutions. It is assumed that encyclopedias and other reference materials are readily available.

Problem I:

The 19th century Austro-Hungarian empire was a seething reservoir of nationalities. Almost every important race of Europe was represented in the Hapsburg domains.

1. Study a map of the world and point out how the geographic position of the Austrian Empire in Europe and the presence of the Danube valley created this multi-national state.
2. What problems necessarily arose as a result of the presence of mixed nationalities? Compare these with similar problems of many nationalities in New York City.
3. How did the problem of a mixed population determine Austrian foreign policy?

Problem II:

A. The population of the Austrian Empire as late as 1918 was 24% German, 44% Slavic, 20% Hungarian, 7% Rumanian, 3% Italian, and 2% others.

B. Still, business, government, and the army were controlled by the German elements, and German was the official language in the schools, army, and government bureaus. Moreover, the non-German elements included such ancient and advanced cultures as the Bohemian and Italian.

1. How was it possible for a minority of the population to impress its nationality on the mixed majority?
2. What would be the inevitable reaction to the facts stated in B on the part of a student at the University at Prague?

Problem III:

A. In the first half of the 19th century (to 1867), the Austrian Empire, still dominated by Metternich's ideas of repression and intolerance of the nationalist feelings stirred by the period of the French revolution and Napoleon, attempted strictly to enforce a Germanization policy. During that same period of time, the Austrian Empire was faced by revolutions in its Czech, Hungarian and Polish areas in 1830, by Czech, Hungarian and Italian areas in 1848, and by the Hungarian area again in 1867.

B. In the second half of the 19th century Austrian policy changed. The experience of the earlier revolutions and the necessity of preventing further outbreaks among its conglomerate domains tempered the Hapsburg rulers, and certain reforms were adopted. Subject nationalities were given a voice in the government, local diets reflected local, nationalist diversities, and, under the Taaffe ministry, 1879-1893, concessions were made in the way of recognizing as co-official the languages of certain subject nationalities. During this same period of time not a single revolt of significance occurred against the Austrian government, and even the unruly Magyars were pacified by the Ausgleich of 1867.

1. From the facts presented in A, what conclusions can you draw as to the effects of the suppression of nationalist ambitions?
2. Compare this with the effects of the later Austrian policy of tolerance and conciliation towards subject peoples.
3. Compare the treatment of subject nationalities in the Austrian Empire with their treatment in the Ottoman Empire. Does this difference in attitude have any connection with the fact that the Austrian Empire lasted until the military defeats of the World War, while the Ottoman Empire, all through the 19th century, died a slow and lingering death, accompanied by amputations of its members?
4. Pretend that you are the Austrian Prime Minister in 1900. In the light of the foregoing considerations prepare a speech for the Austrian Diet outlining your

Scanned with CamScanner

policy toward the subject nationalities.

Problem IV:

Of all the subject nationalities of the Austrian Empire the Magyars were the most insistent in maintaining their national existence and the equality of the Austrian and Hungarian sections of the empire. The Ausgleich of 1867 established a dual monarchy and the desired co-equality. But while they cherished their own rights with the utmost pride (even to the point of insisting that the Hungarian language be used for commands in the Hungarian part of the army) the Magyars ruthlessly trampled on the rights of the other nationalities under their control. The Magyars were but 54% of the population of Hungary, but held all except 10 of the over 400 seats in the Hungarian diet. For 50 years a policy of persistent Magyarization was pursued. Electoral manipulation, suppression of schools, and of the literary, social, and economic life of the minorities were everyday incidents in the intolerant policy pursued by the Magyars. On one occasion Rumanian schoolboys were expelled from school for speaking their own language on the street.

1. How do the above facts illustrate the statement that "the worst oppressors are the oppressed"? Can you find other illustrations of the same fact?
2. Why should the Magyars have been the normal leaders in the movement for better treatment of the subject nationalities?

Problem V:

Using the facts and ideas presented by the previous problems can you explain why

1. The 20th century unrest among the subject nationalities of the Dual Monarchy was directed chiefly against the Magyar kingdom?
2. The World War brought to a head the suppressed nationalist ambitions of the subject peoples of Austria-Hungary?
3. Since the World War the heirs of the Hapsburg domains have been bound together in the Little Entente?

Problem VI:

In the post-war territorial adjustments the principle of self-determination for all nationalities was fundamental. Nevertheless, it proved impossible to adjust the national and political frontiers with any degree of exactness. Consequently it was found that the successor states contained within their boundaries large minorities of different nationalities.

1. What fears naturally arose in the minds of these minorities as to their status within the new national states?
2. How did the Minorities treaties attempt to quiet these fears and to prevent the repetition of former racial hatreds and nationalistic intolerance?

Problem VII:

A. Using the available reference material make a chart entitled "Contributions Made in the Fields of Music, Art, Literature and Science." Include in the chart the following items: (a) name, (b) nationality, (c) nature of contribution, (d) significance of contribution for world history. Use the following names: Jokai, Sienkewicz, Dvorak, Liszt, Michael Pupin, Verdi, Chopin, Paderewski, B. Crocce.

B. In the light of your findings in A, consider the question of the right of any one nationality to try to crush out the individual existence of others.

Special questions for supplementary consideration:

1. From the history of the last decade in the new national states of Europe would you say that Europe had learned its lesson in the treatment of alien races?
2. Does the experience of the United States or of Switzerland present any possibility of alternative solutions to the problem of multi-national areas?
3. Prepare a constructive programme for a régime of many, diverse nationalities that will make possible the harmonious development and coöperation of all within the political boundaries of one state. What mental attitudes would be necessary for its success?

ELIZABETH V. EISENBERG.
Samuel J. Tilden High School.

The Meaning of the Passing Mark

The 65% mark or the passing mark is really the critical point in the entire marking system. If a pupil fails, the exact mark is immaterial. If he passes, the exact mark is important, only because it determines whether he is eligible for certain honors and for admission to college.

I am particularly interested in the passing mark and its meaning. If we were to rank our pupils according to achievement in our subjects, placing the best pupil first and the poorest last, where would we place the passing mark? What level of achievement merits a passing mark—a 65%—and what merits a failure—64% or below?

Failing our pupils has been very costly—in money to our city and in money, time, and happiness to our pupils. The 1930 report of the Auditor of the Board of Education discloses the fact that it cost the city $170.93 to instruct a high school pupil in that year, or $85.47 per term. In Table 3, you will find a few facts taken from the Superintendent's last annual report. In the first column you will note that for the term ending January, 1930, 148,828 different high school pupils received a total of 1,081,647 different ratings, and of that number, 144,551 were failures. Using these figures and those of the Auditor, I was able to determine that it cost the city $1,684,260.55 when we failed our high school pupils in January, 1930. The cost to the city for the term ending June, 1930, was even larger for it amounted to $2,104,903.04. The total cost in 1930 to instruct our high school failures amounted to the large sum of $3,789,163.59. This was 2.3% of the total cost of our schools in that year. Not only is the giving of failing

marks costly to the city, but it is costly to our pupils in time, money, and happiness.

In searching for the meaning of the passing mark, my studies led me to examine, first, the records of Walton High School, second, the practices of teachers as disclosed by these records, and third, the record and practices of other schools both in New York and outside.

In Table I, is found a tabulation of marks given during the terms ending in January, 1931 and June, 1931. I have used the rating groups employed on the Summaries of Instruction in Walton High School,—0-64; 65-74; 75-89; and 90-100. I have shown the per cents of the marks in any rating group to the total marks given in any particular subject. I have arranged the per cents of one term next to the per cents of the succeeding term in order that we may more easily make comparisons.

A comparison of these figures shows a wide variation in marking practices. First, for example, the English Department fails about 1% of its pupils whereas, the Accounting, French, German, and Stenography Departments fail 9% and over of its pupils in both terms. Second, there is a lack of consistency in the per cents of failures each term. The following departments are glaring in their lack of consistency. The Commercial Arithmetic Department failed 6.7% one term and 17% the next term. The Economics Department failed 5.6% one term and 10% the next term. The Biology, Chemistry, Physics, Spanish, and Mathematics Departments show similar sets of facts. Third, the lack of consistency found in the 0-64 group is present in the other rating groups.

These variations show that the different departments in our school lack an objective and permanent standard for assigning marks in the different rating groups.

In Table II, I have presented a tabulation of marks given in the different departments of all the New York high schools in 1930. Two conclusions may be drawn from them. First, that the per cents of failures in one department is different from that of another. And second, there is an appearance of consistency in the per cents of failures each term. At this point I wish to express caution against comparing Tables I and II, for they are tabulations for different years. I was prevented from tabulating the marks given in Walton in 1930 by the loss of records for that year.

I was unable to tabulate the marks of the different schools in all subjects because the information was not available. However, I did get the following facts. In English, our school passed as many as 98.7% of its pupils, whereas another passed only 70.7% of its pupils. In Mathematics, one school passed as many as 88.5% and another only 66.1%. Still in a third department, French, one school passed 88.4% and another 66.2%.

Here again we are confronted by variations which make generalizations impossible.

Having satisfied myself that the rating practices of this school and other

TABLE III

Summary of ratings given in the New York High Schools for the terms ending Jan. 31, 1930 and June 30, 1930

	Jan. 1930	June 1930
Number of ratings given	1,081.647	1,138,590
Number of passing ratings	937,096	982,617
Number of failures	144,551	155,973
Per cent passed	86.6%	86.3%
Number of different pupils	148,828	159,359

schools in past years were not consistent and would disclose no clue to the meaning of the passing mark, I turned to the rating practices of different supervisers and teachers in this school and outside.

A number of high school administrators were asked what they considered to be the meaning of the passing mark. The following are some of the replies:

1. Mastery of minimum essentials.
2. Fulfilling the letter of the law.
3. Doing all that can reasonably be expected.
4. Ability to carry subsequent work in the same grade.
5. Completing 65% as much work as the best pupil in the class or in the teacher's experience.
6. Completing 65% of the assigned work.
7. Attaining 65% of perfection.
8. Doing all required by the teacher.

The Beechview-Beechwood public schools have arranged a rating system. They fail a pupil who shows the following characteristics:

1. Recitations show little idea of subject matter.
2. Pupil asks and answers very few questions.
3. Less than 65% of assignments done correctly.
4. Makes no preparation.
5. Cannot follow directions.
6. Does not make up work lost during absence.
7. Is indifferent and listless.
8. Lacks enthusiasm and coöperation.
9. Has very little ability to apply knowledge.

These lists of standards are only suggestive and not at all complete. They should serve merely to indicate some of the standards which teachers should have in mind when failing pupils.

All the facts presented up to this point have shown that we have been employing varying standards in passing our pupils and the results of these varying standards have been costly.

I wish to offer the following recommendations which will make our marking practices more consistent and our marks more objective.

1. Wherever possible, standardized achievement tests should be employed. I make this suggestion so that teachers may make their marks objective and be able to compare the scores of the pupils with the norms on the tests.

2. If standardized tests are not available, the new objective tests should be employed to decrease the subjective element in the mark.

3. Pupils should be ranked before marks on any examination or quiz is assigned. In this way, the differences in the difficulty of examinations will be eliminated from consideration. A good pupil will rank high on a hard examination as well as on an easy examination.

4. We should eliminate differences in marks below 65%. We ought to have just one failing mark and call it failure or F, or some other character. It matters little to the pupil whether he receives 20% or 55%. Both mean

Scanned with CamScanner

the same thing — non-promotion or repetition of the course.

5. Each department should determine the percentage of all pupils whom they are to pass. This can be determined by examining the per cents of former terms. These per cents can be called norms of promotion. For example: In Walton, our experience has been that English teachers passed term in and term out at least 98% of its pupils. Therefore, the norm of promotion in the English department should be 98%. Each teacher in the English department should be expected to pass that per cent of his pupils. I am not advocating the failing of 2% of all pupils in English, but, on the contrary, I advocate the passing of 98% or more of all pupils in English. Once we have established the norms of promotion in each department we can set ourselves to raising these norms.

6. Each department should set up a list of minimum requirements for determining the passing mark in each grade.

7. Failing marks should be accompanied by detailed word statements, of lack of ability to do. It is not enough to say to a pupil. "You have 55%. You have failed." A detailed diagnosis should accompany each failing mark. Mr. Jason and Mr. Kessler have both suggested a plan which has been put into operation in the accounting department. A form card has been devised for recording the facts about failing pupils. This card is prepared at the end of the term. On it is found the following information:

1. Name .....
2. Subject .....
3. Term ending.....
4. Grade of Subject.....
5. Term Mark.....
6. Regents' Marks.....
7. Cause of Failure.....

The teacher who fails a pupil must point out to the pupil and to the chairman the ability or lack of ability in each of the different phases of the subject. This card is not merely filed but is used by the next teacher.

DAVID GORDON.

Walton High School.

Boardwork Technique in English

While teachers of English use the blackboards frequently and successfully during the composition and grammar periods, many devote the literature period entirely to discussion and make no use of the boards.

It is the purpose of this paper to describe a method of boardwork procedure used in connection with literature in the lower grades which has been found to be quite workable and effective. The method about to be outlined achieves two important aims: first, the subject matter of the text is covered rapidly and effectively, thus leaving time for discussion of problems arising from the literature; secondly, habits of neatness and accuracy in written work are developed. This latter the writer believes to be an indispensable achievement and, hence, is of the opinion that some boardwork should be incorporated into nearly every lesson.

The method is as follows:

The assignments (written on library cards) are made at the beginning of the period. At the same time a critic is appointed for each student at the boards. The duties of the critic are discussed several paragraphs below.

First: A few remarks about the *form* of the boardwork. The student is required to put the regular English heading on. If it is a question which is to be answered, the question must be put on before the answer; if it is a topic sentence which is to be developed into a paragraph, the student must be careful *not* to separate the topic sentence from the rest of the paragraph. Wide margins (about three inches of actual board space) must be kept on either side. Scrupulous neatness is a *sine qua non*.

As to the types of assignments. The writer has successfully employed two kinds. First, there is the question which must be answered in a *single* sentence. This is particularly effective in the first year, where the aim of the work in technical English amounts to teaching the student to write a complete sentence. In second year classes the use of a topic sentence which the student is asked to develop into a paragraph has been found to be really an excellent way of teaching paragraph unity. Particular emphasis is laid on the fact that the topic sentence is part of the paragraph and hence must not be separated from the body of it as though it were a title. All boardwork assignments are concerned with the subject matter of the literature. Thus, while the boardwork is being written, the members of the class are free to discuss the application of the subject matter to real life, in terms of their own experience.

The critics function very noiselessly and automatically. After they are appointed, nothing further is said to them. The critic (who is usually one of the brighter students and, hence, better equipped for the purpose of making sound criticism, just as the student sent to the board is usually one of the more ordinary students, and hence in need of correction and criticism) takes part in the class discussion while the boardwork is being written. As soon as the person he has been assigned to criticize has finished, the critic, without waiting for any order from the teacher (and hence without interrupting the discussion) proceeds to the board to make his written criticisms.

Colored chalk (preferably yellow) is used by the critic for making corrections. This the writer has found to be very effective, for it makes the corrections stand out, and whereas a student might not notice, for instance, that in *believe* the *i* precedes the *e*, when the correction is made in the same medium as the rest of the work, he cannot fail to see it when it is written in vivid yellow.

The criticisms are written in the wide margins which are especially left for this purpose on either side of the board. If a word is misspelled, it is

Scanned with CamScanner

underlined and the correct spelling is indicated in the margin. Other corrections are made similarly. The critic may (and often does) write a statement of general criticism.

The criticism is divided into two well-defined classes: criticism of subject matter, and criticism of technique. Thus, the critic, who marks the work, places two marks (and their total) on the board. On a basis of ten, five points are allowed for the answer and the remaining five points for technique. Accordingly, a student whose answer is absolutely correct may receive a failing mark of five because of errors in spelling, grammar, and the like. It is the writer's opinion that even in a literature lesson, good English is important; too often, serious errors go uncorrected because "it is a literature day."

There is an absolute scale of deductions (familiar to the students, because it is sometimes employed in marking literature tests of that type) for errors in technique. Since it would obviously be unfair to deduct equally in the single sentence answer, where the number of possible mistakes is limited, and in the paragraph type of answer, where the possibilities of error are multiplied, the simple expedient of deducting only half as much in the paragraph type as in the sentence answer has been adopted.

The student loses five points (all credit in technique) for a sentence structure error, such as a run-on or an incomplete sentence. (In a paragraph answer he would lose only two and one-half points.) For less important errors, such as those in spelling, grammar or punctuation, only one point per error is deducted, in a single sentence answer. The critic may deduct, also, for lack of neatness, the penalty being the same as for a minor error. The critics are encouraged to be very finicky in this respect, with the result that the boards, in a very short time, assume a startlingly neat and clean appearance.

It has been the writer's experience that this exact method of marking is approved by students. Nothing is more exasperating to an intelligent student than to have a teacher give an arbitrary mark which he cannot justify. "Because that's what it's worth" is not a highly satisfactory answer to the question, "Why did I get only sixty-five?" On the other hand, the student cannot and does not feel himself the victim of high-handedness if he knows that he lost so many points for this error, so many for that, and so on. Instead of bearing a grudge, he makes up his mind (if he has any intelligence) not to lose credit for those particular errors, next time.

It takes so many words to describe this method, possibly it may appear complicated and time-wasting. Quite the contrary; once the machinery of it has been explained to the class, it runs like a well-oiled engine, smoothly, quietly, automatically. As for consuming time, the writer has found this method rather a time-saver. Six boards are usually covered in between eight and ten minutes. Somehow, the efficiency of the method eliminates the usual tendency on the part of the class to quibble over trifling points in correction.

Finally, the strongest argument that can be adduced in favor of this procedure is that the writer finds that the habits of neatness and accuracy which the student develops (perforce) at the board, are transferred to all other written work done in the English class. What marker of book reports does not consider this important?

JESSE GRUMETTE.

Abraham Lincoln High School.

Theory and Practice at the Abraham Lincoln High School.

The picture years ago:

In 1889 a conference of great moment was held in Boston, now known as the "Famous Physical Training Conference of Boston." Educators at that time were becoming enlightened, and realized the truth of "Mens sana in corpore sano." As a result, physical education was placed on the same level as academic education.

The problem which faced the educators at the conference after their first decision was the administration of a program. Every foreign system of physical education which held sway was advocated. Pandemonium reigned. Each was dismissed as impracticable because of lack of time, space, facilities, or trained teachers. After a great deal of bickering, the stunted, worthless, but time-saving "two minutes drill" in a classroom was evolved. These two minutes of arm waving and trunk bending, the educators decided, would be sufficient physical activity for thousands of school children cramped up in small seats, four to six hours each day, studying their lessons. The guardians of child training were initiating a program without any regard for the children at all. For three decades the practice remained the same in spite of ever-changing conditions of living in schools and the localities.

Through the obscure clouds of darkness came an effulgent beam of hope—educational psychology and new principles of education appeared. Along with these studies came the progressive, scientific educators. Instead of containing the hackneyed, time-worn practice of the preceding century, they instituted a child-centered course of study. Once more the physical educators kept pace and made the principles of education the principles of physical education. They realized the narrow limits of the old methods in the light of the new. In view of the fact that "Will must first be Idea," they formulated, on paper only, a mere skeleton of their plan for the new physical education.

As a guiding aim, it was proposed that "physical education should aim to provide skilled leadership and adequate facilities that will afford an opportunity for the individual or group to act in situations that are physically wholesome, mentally stimulating and satisfying, and socially sound." Along with the health program there was also provision for health service and health instruction. With this in mind, the following program was outlined:

Scanned with CamScanner

1. Individual corrective gymnastics.
2. Games, sports, athletics and aquatics, as far as possible, out of doors.
3. Dancing and dramatic activities.
4. Self-testing and self-defense activities.
5. Fundamental skills.
6. Natural gymnastics.
7. Athletics for all (intra-mural athletics).

Is this work merely theoretical, or can it actually be put into practice? To answer this question, let me give you a picture of the Health Education program carried on at the Abraham Lincoln High School.

The students are given a very worth-while course in health instruction and health problems. As far as health service is concerned, there are maintained a school clinic and first-aid rooms for boys and for girls. The health examination is given by the school doctor. The Parent-Teachers Association, through great effort, has established a dental clinic where a prophylaxis examination and charting of teeth are made for a nominal sum. The facilities of the school for sanitation are beyond complaint, and the environment is ideal. A very elaborate and careful check-up of the health record of each student is made, and the follow-up work is carried on by each teacher of the Health Education Department. But let us turn now to the immediate work of the Physical Education Department—"to provide big-muscle activities"—to see whether that end of the program is being carried out.

Both students and teachers, stimulated by an enthusiasm that will not be tempered, are carrying on as full a program of physical activities as was ever hoped for by our educators several years ago. How does this work meet the outline as set forth above?

I. Individual corrective gymnastics.

In order to aid those boys who are handicapped by physical, postural, nutritional, or cardiac defects, and who could not possibly reach the standard of work done in the regular classes, there is a separate class established, where individual work is given to each student. In this manner the work of the regular class is not retarded; these handicapped boys get a great deal more joy and benefit out of the exercises, and the establishing of a feeling of inferiority is avoided.

II. Games, sports, athletics and aquatics.

At Lincoln, the happy medium of varsity and inter-class athletics has been struck, with equal emphasis on each. With the ascendancy of varsity athletics in high schools and colleges to the high pinnacle which it now maintains, a reactionary cry has been set up. Why should so much time and effort be lavished on young athletes who will very likely attain physical supremacy without this attention, with neglect and disregard of the mass of students who really need it? Our present organization is an answer to both. We have varsity athletics, football, baseball, basketball,

track and field, soccer, swimming, fencing, and handball. We have mass-athletics, that is, activity for all. The following is, in detail, the complementary organization of intra-mural athletics.

1. *Organization*
   a. E Session Class Athletics. Managers' Council every second Wednesday, 7th period in room 205.
   b. L Session Class Athletics. Managers meet every first Wednesday, 6th period in room 205.
   c. Faculty and pupil representatives on Boys Athletics Council meet every 4th Friday during the 7th period in the Clinic.
   d. Each class team elects a captain for that team.

2. *Activities*

	E Session	*L Session*	*Place*
a. Basketball	Mon., Wed., Thurs. periods 7-8	Friday 5th period	Gym
b. Tennis	Mon., Wed., Fri. periods 7-8	Mon., Wed., Fri. periods 5-6	Courts
c. Football	Spring Prac. Mon., Wed., Thurs. periods 7-8	Touch Daily periods 5-6	Field
d. Handball	Mon., Wed., Fri. periods 7-8	Mon., Wed., Fri. periods 5-6	Courts
e. Baseball (Indoor)	Daily periods 7-8	Daily periods 5-6	Field
f. Soccer	Mon., Wed., Fri. periods 7-8	Tryouts daily period 3	Field
g. Volley Ball	Mon., Wed., Thurs. periods 7-8	Friday period 5	Gym
h. Swimming	Monday periods 7-8	Alter. Fri. period 5	Pool
i. Track	Mon., Wed., Fri. periods 7-8	Daily period 5	Out
j. Cross-Country	Mon., Wed., Fri. periods 7-8	Daily period 5	Out
k. Rifle			Range

3. *Clubs*
   a. Leaders — Monday, periods 7 and 8 in the gym.
   b. Captains—Tuesday, 7th period in the gym.
   c. Tap Dancing and Tumbling —Thursday, periods 7 and 8 in the Corrective Room.
   d. Fencing Club—Monday, 7th and 8th periods. Friday, 7-8 Out Corrective Room.
   e. Wrestling—Friday, 7th period in the Corrective Room.

4. *General Regulations:*
   a. Health Examinations on file.
   b. Parent's Consent slip on file.
   c. G. O. membership.
   d. Prefect Teacher's signature on blank.
   e. Varsity Team members ineligible.

Scanned with CamScanner

f. Proper outfits, shower (5c. a towel).
g. Read rules for activity.
h. No entry fees required.
i. Entry blank for each sport.
j. Medals to winners.
k. Watch bulletin near gym.
l. Be on time.

Be a Good Sport: Win or Lose.

HANDBALL

1. Each prefect class may enter a team of seven players and three substitutes.
2. The captain of the team shall choose seven players for each game.
3. Each match shall consist of three singles games and two doubles games. The singles shall count one point as well as the doubles.
4. The first round games will consist of fifteen points. All the other rounds up to the last four games will end at 21 points. The last four games will be de-decided by 31 points.
5. Before a match begins, the captains of the respective teams will submit a list showing the names and the order of the players. The order of players cannot be changed during a match but may be changed for the next match.
6. The first ten players of the Lincoln Varsity Handball Team are ineligible to participate in this tournament.
7. Games will be played at our school courts as scheduled.
8. Players must wear gym shoes and gym suits if possible. Players may use gloves. Balls will be supplied by G. O.
9. Health Examination — G. O. Member — Parent's Consent Card.
10. See Mr. Spear for information.

SWIMMING

E Session Practice Schedule: Every Monday, periods 7 and 8. From March 7 to May 23, inclusive.

Championships: Monday, June 13—7th and 8th periods.

Events

50-yard free style; 100-yard free style; 50-yard backstroke; 50-yard breast stroke; 200-yard relay.

L Session Practice Schedule: Alternate Fridays, period 5 (10.30) March 4-18; April 15-29; May 13-27.

Championships: Friday, June 10, at 10:30 a. m.

Rules

See Mr. Lux for information.

1. A prefect room may enter two boys in each event and six in the relay. A pupil may enter one event only.
2. Medals to winners in each event.
3. Varsity Team members are ineligible to compete.
4. Health Examination—G. O. Member—Parent's Consent Slip.

BASKETBALL

1. Each prefect may enter teams of five players and two substitutes.
2. Time: Two ten-minute halves, five minutes' intermission.
3. Proper gym costume; shower bath.
4. Varsity team members ineligible to compete.
5. Health Examination—G. O. Card—Parent's Consent Slip.
6. See Mr. Kroff for information.

SOCCER

1. Prefects may enter teams of eleven players and two substitutes.
2. A team shall consist of not less than nine nor more than eleven players.
3. Wear old clothes or uniforms. Soccer shoes if possible.
4. Varsity players are ineligible to compete.
5. Health Examination—G. O. Card—Parent's Consent Slip.
6. See Mr. Ball for information.

RIFLE

E Session—Tuesday, Wednesday, Friday; periods 7, 8, 9, 10.

L Session—Boys who have free periods as in E session.

Report to Rifle Range for Practice and Individual Championship.

Medals to winners.

See Mr. Steinberg for information.

TRACK

1. Cross-Country.
2. Shot Put.
3. Running Broad Jump.
4. Running High Jump.

Rules

1. Each competitor must practice at least twice a week.
2. Varsity of each event.
3. One set of medals for each event.
4. A day will be scheduled for the championships in each event.
5. Practice:

   E Session—7th and 8th periods, Monday, Wednesday, Friday.

   L Session—10:30 daily.
6. Health Examination—Parent's Consent Slip—G. O. Card.
7. See Mr. Schechter for information.

Regular Field Day in June.

FOOTBALL

E Session: Regular Spring Practice in April. Monday, Wednesday, Thursday; periods 7 and 8.

L Session: Inter-class Touch Football and Spring Practice. Daily at 10:30.

Touch Football Rules

1. Prefects may enter a team of six players and three substitutes.
2. Ball is put in play by forward pass. On the pass from team A to team B, the first person who touches it puts the ball into play, whether he catches it or fumbles it.
3. The receiving team keeps it in play until the one carrying the ball is tagged by an opponent.
4. The ball is out of play if any person of the receiving team drops the ball (except the first receiver).

Scanned with CamScanner

5. The ball is not out of play unless the one carrying the ball is tagged by any one opponent with his two hands.
6. To put the ball in play again, the receiving team throws forward pass to opponents.
7. The receiving team may work the ball towards the goal by means of passes.
8. There is to be no blocking; ball to opponents where foul occurs.
9. A player who runs offside is ineligible for the remainder of that play.
10. Time: Two ten-minute halves with five-minute intermission.
11. Points: 5 points for each touchdown. After a safety the ball is put into play from the goal line.
12. Health Examination — G. O. Card—Parent's Consent Slip.
13. See Mr. Jacobs for information.

VOLLEY BALL

1. A team shall consist of eight players and two substitutes.
2. A game shall consist of fifteen points. Two out of three games.
3. Service shall be in rotation.
4. All pupils are eligible for the team except members of any Varsity Squad or members of the class Basketball or Handball team.
5. Health Examination — G. O. Card—Parent's Consent Slip.
6. See Mr Klaskin for information.

INDOOR BASEBALL

1. Nine men and two substitutes. Varsity Baseball team ineligible.
2. Special Rules: Seven innings; two strikes or two fouls or a combination are out. Three balls constitute a walk. Underhand pitching. No stealing of bases except on a hit or if a play is made for the base-runner. Regular baseball rules to govern otherwise.
3. E Session—periods 7 and 8 daily. L Session, 10:30 a. m.
4. Health Examination — G. O. Card—Parent's Consent Slip.
5. See Mr. Fish for information.

III. Dancing.
IV. Self-testing and self-defense.
V. Fundamental skills.
VI. Natural gymnastics.

These four items of the theoretical program are quite thoroughly covered in the regular health education classes, which must be attended by all students of the school.

Clog, tap, and social dancing are given during parts of each semester. Self-testing stunts are taught the students on the heavy apparatus and the mats. Boxing and wrestling elements are taught during regular floor formation and opportunity is provided for practice during the squad changes. Fundamental skills and natural gymnastics vary with the season, since it is best to teach during the time that each sport is played.

VII. Athletics for all. In answer to this last item of the theoretical program, I present a few statistical figures showing the number of boys indulging in athletics at Abraham Lincoln High School:

Varsity Athletics	*Approximately*
Football	50 boys
Baseball	30 boys
Basketball	15 boys
Track and Field	60 boys
Soccer	35 boys
Swimming	30 boys
Tennis	10 boys
Golf	10 boys
Rifle	10 boys
Fencing	8 boys
Hand-ball	10 boys

Intramural Athletics

Basketball	420 boys
Tennis	100 boys
Football	400 boys
Hand-ball	450 boys
Baseball	660 boys
Soccer	600 boys
Volley ball	400 boys
Swimming	600 boys
Track	300 boys
X-Country	70 boys
Rifle	20 boys

This completes the picture of the program fostered and organized by the Abraham Lincoln High School's Boys' Health Education Department, and supervised by Mr. Kaufman.

JULIUS JACOBS.
Abraham Lincoln High School.

A Reading List for Students of "Vocations and Industries"

The needs of a course such as this, where a wide range of occupations and industries is covered and an attempt is made to get each student interested in a particular vocation, cannot be met simply by supplying pupils with a text-book. In the first place, there is not a text-book in this subject which would adequately meet the demands of either teachers or students. Secondly, the very purpose of the course is to get away from the text-book method and have students do a little exploring of their own. Consequently, I have found pupils frequently asking for books which I would recommend for their particular occupation. This occurs most often when they begin their work on their projects.

For this reason the following reading list has been prepared for the students of our Vocations and Industries classes. Its purpose is to serve as a guide to obtaining further information about their future occupation. Each student is required to read one entire book in the first half of the term and use other books in connection with his project which is carried on in the second half of the semester. Books not on this list may be selected with the approval of the teacher.

There is no claim made to originality in drawing up the list. Various sources have been employed. A good many of these books have already been used in my classes. In the near future, we hope to improve upon our list by adding to it a brief description of the contents of each book. In the meantime, however, it is my hope that it may be of some help to other teachers of this subject, especially to those who are teaching it for the first time.

Vocations and Industries

Reading List for Students

I. *How to Choose Your Vocation*

Blackford, Newcomb ..... The Right Job
Ernst, C. H. ..... What Shall I Be?
Filene, Catherine ..... Careers For Women
Harris, F. S. ..... The Young Man and His Vocation
Hawksworth, H. ..... What Are You Going To Be?
Hoerle and Saltzburg ..... The Girl and The Job
Kitson, Harry D. ..... How To Find The Right Vocation
Kitson, Harry D. ..... I Find My Vocation
Marden, Orson S. ..... Choosing A Career
Parson, Frank ..... Choosing A Vocation
Rodger, Esca G. ..... Careers
Rollins, F. W. ..... What Can A Young Man Do?
Rosengarten, Wm. ..... Choosing Your Life Work
Toland, Edward ..... Choosing The Right Career

II. *Do you Wish to Know More About Various Industries, Occupations, Professions?*

Then read:

Allen, Fred J. ..... Business Employments
Bernays, Edw. L. ..... An Outline of Careers
Cooley, Belman and Rodgers ..... My Life Work, 4 volumes
1. Building and Metal Trades
2. Printing and Servicing Trades
3. Store and Office Occupations
4. Representative Industries

Doughton, I. ..... Preparing For The World's Work
Filene, Catherine ..... Careers For Women
Fryer, Douglas ..... Vocational Self-Guidance
Giles, F. M. and I. K. ..... Vocational Civics
Gowin, Wheatley, and Brewer ..... Occupations
Hatcher, O. Latham ..... Occupations For Women
Hill, Howard C. ..... Vocational Civics
Holbrook and McGregor ..... Our World of Work
Jackson, B. ..... Opportunities of Today for Boys and Girls
Laselle, Mary A. ..... Fields of Work for Women
Leuck, Miriam ..... Fields of Work for Women

Lyons, L. S. ..... Making A Living
Meyers, G. E., Little, G. M. and Robinson, S. M. ..... Planning Your Future
Platt, R. H. and Fainbam, R. T. ..... The Book of Opportunities
Proctor, Wm. M. ..... Vocations
Smith and Blough ..... Planning A Career
Weaver, E. W. ..... Vocations For Girls
Weaver and Byler ..... Profitable Vocations for Boys
Ziegler, S. H., and Jaquette, H. ..... Choosing An Occupation

III. *Do You Intend to be a Salesman or an Advertising Executive?*

Then read:

Calkins, Ernst E. ..... The Business of Advertising
Cooley, Belman and Rogers ..... My Life Work, Volume III, Store and Office Occupations
Copeland, M. T. ..... Principles of Merchandising
Filene, A. L. ..... A Merchant's Horizon
Fowler, Nathaniel C. ..... Practical Salesmanship
Haywood and White ..... Chain Stores
Horner, W. W. ..... Training For A Life Insurance Agent
Hoyt, C. ..... Training For The Business of Advertising
Hungerford, Edw. ..... The Romance of A Great Store
Indianapolis Vocational Information ..... Department Store Service
Kaster, E. H. ..... Advertising
Maxwell, Wm. ..... Training of A Salesman
Norton, Helen L. ..... Retail Selling
O'Leary, Iris ..... Department Store Occupations
Prince, L. W. ..... Retail Selling
Seigbe, Ruth ..... Elements of Retailing

IV. *Do You Wish to Work in an Office as a Stenographer, Typist, Secretary, or Bookkeeper?*

Then read:

Allen, Fred J. ..... Business Employments
American Telephone and Telegraph Co. ..... Work and Opportunity: Bell Service
Cooley, Belman, Rogers ..... My Life Work, Volume III, Store and Office Occupations
Federal Bureau of Education Bulletin ..... Survey of Junior Commercial Occupations

Instructions to News Board Members At the Bushwick High School

1. Read and reread this instruction sheet from time to time.
2. You will learn these rules only through use, and not by reading them.
3. After writing a news story, take out this instruction sheet and check against it.
4. Failure to adhere to any of the instructions or failure to submit material on time may result in dismissal from the staff.

Assignments

1. Assignments will appear on the Bulletin Board every Thursday morning.
2. The assignment will specify:
   a. Number of lines for story.
   b. Number of units for headline.
   c. Size of headline.
   d. The deadline (date the news story is due).
3. The assignment must be adhered to very closely.

Writing the News Story

1. All rules of correct English must be followed:
   a. Run-on sentences must be avoided.
   b. The same tense should be used throughout the news story.
   c. The same words should not be repeated too often.
2. No paragraph should exceed sixty words; the shorter the paragraph the better.
3. The summary of the news story should appear, in its opening sentence. This first sentence should answer the questions: What? Who? When? Where? Why?
4. Omit the year (1932, 1933) when writing about a current date. Check all names to see if they are correctly spelled.
5. Congratulations, thanks, and praise should be omitted. If you think them necessary, mention indirectly by saying, "The applause was indicative of the response which the speaker's remarks met," or some such phrase.
6. *Number of Lines*

When the issue is planned, a definite number of lines is allowed for each news story. *Reporters must adhere closely to the line limit.* Not a line less nor a line more will be accepted.

7. For your own protection, have the teacher (or other person from whom you received the information) sign your news story.
8. The reporter's signature must appear at the end of each news story.

How to Count the Number of Lines

1. Count the number of words in each paragraph.
2. Write that number in the right-hand margin.
3. Divide that number by 6. The answer will represent the number of lines needed for the paragraph. Any fraction in the answer calls for an additional line.
4. Write the number of lines in the left-hand margin.
5. Do the same for each paragraph.
6. When finished writing the news story, add the numbers in the left margin. This will give you the total number of lines needed.

Headlines

1. Reporters will submit headlines with their news stories.
2. The assignment sheet will indicate the nature of the headlines. Adhere to those instructions.
3. The head should always bring out the main point of the article.
4. The verb in the head should be in the present tense.
5. All parts of the verb "to be" are to be omitted from the head.
6. Space of letters:

   M and W count as 1½ letters each.

   i and I count as ½ letters each.

   , ; ' count as ½.

   All others (letters and numbers) count one.

I. D. SATLOW.
Bushwick High School.

Coöperative Group Projects in American History

In the April, 1931, and November, 1932, issues of HIGH POINTS, the writer described class projects in European and American History which grew out of the supplementary reading required of each student. During one semester, the same general procedure was adopted with reference to group projects in American History.

Two classes in the first term of American History were given the option of reading the necessary amount of supplementary material as directed or of working out coöperatively a plan of their own. The latter course was unanimously adopted in each class and it was proposed that a committee be chosen to draft a plan or several plans of procedure to be submitted to the class for revision and adoption. A volunteer committee was selected and given a week in which to do its work. Inasmuch as the general procedure in each class was essentially the same, it will suffice to describe the subsequent progress in one of them.

The committee, in submitting its report, offered six alternative procedures with the arguments for and against each plan, made its recommendations in favor of one of them and answered all questions and objections raised. The plan adopted provided for the division of the class into seven committees of five, each committee to work on a different subject and to submit a coöperative oral and written report. For convenience, it was decided that each row of five, from side to side of the room, was to form one of the committees.

The original committee was authorized to draw up a comprehensive list of subjects suitable for coöperative reading and study by the groups concerned. A week later, the committee presented a list of close to a hundred subjects compiled with the assistance of the other members of the class. A mimeographed copy was placed in the hands of each student, at the beginning of the period, and he was asked

Scanned with CamScanner

to evaluate each item as suitable, unsuitable, or doubtful. About twenty-nine subjects were judged to be desirable as a result of the foregoing method of selection supplemented by some discussion.

At the beginning of the following period, these were placed on the blackboard. Each committee was given a minute to choose its chairman and several minutes to select a topic from those listed. Alternate choices were to be indicated in case of conflict. Due to the wide range allowed, all but two of the groups selected different topics. They too settled their difficulty satisfactorily through the medium of the alternate choice provision.

The class, with the advice of the teacher, arrayed the topics in the order of difficulty and arranged the time schedule for the reports. The committee to report first was to be given a month to do its work, each of the others following in the order determined, a week apart. A period was to be devoted to each group report, with the chairman of the group presiding and each member reading or otherwise presenting his share of the joint report. Time was to be allowed for discussion and critical evaluation of the material presented.

The students decided to submit a typewritten, illustrated, and bound committee report at the time of the oral presentation. Each student was to be on the lookout for illustrations appropriate for other committees as well as for his own. Old history texts, about to be discarded, were given to the students. From these, pictures, maps and various materials from the appendices were taken and used.

The reports were made as per schedule. The oral as well as the typewritten reports were subjected to class criticism. The finished manuscripts were evaluated with respect to content as well as with regard to such matters as the arrangement of material, index, table of contents, table of maps, illustrations, bibliography, cover design, binding, typing, and the like.

Each report, for the most part, was superior to the preceding one, in content as well as in make-up. The bindings, for example, were an illustration of this latter fact. The first ones to be submitted were bound together by cord or clipped together by hand. Later reports were taped, glued, or clipped together by machine. Subsequent reports were sewed together and the last ones were bound by a professional binder with the titles stamped in gold letters on the cover. Each of the finished products of the two classes engaged in this work was exhibited, upon completion, in both classes for examination, guidance, and appraisal, by the students. This was also done for one period during the last week of the term, when all were viewed. They were finally exhibited for a week in the school library for consideration by the entire student body.

Time Devoted to the Project

Work was not begun on the project outlined above until the fifth

week of the semester. Four full periods were necessary for the preliminary work and for the proper organization of the committees. Committee meetings were held each day in class at the discretion of the chairman of each group. Five minutes was the maximum time permitted for such meetings. Thought questions based in the regular lesson of the day served as a guide for study by those groups not holding meetings during these intervals. It was found expedient to set the time for these meetings during the last five minutes of the period, in order to insure adequate consideration of the regular daily program of work.

One period was devoted to each committee report, there being seven in each class. Finally, as related above, a period was utilized in each class for the exhibition of all of the completed work.

Values of the Group As Compared With the Class Project

The writer has noted the following advantages for the group project:

1. Each member of the class is given a larger share of responsibility for the success of a coöperative endeavor. The student can see much more readily the success or failure of his individual efforts.
2. More students are given training in leadership through their functioning as committee chairmen.
3. More extensive correlations are possibly, particularly with art, oral and written English, and typing. Each group is compelled to utilize whatever artistic talent is available in planning the cover, the illustrations, the binding and the like. Furthermore, the latent talents of the average student are compelled to flower.
4. More extensive historical reading is encouraged and the student may know more intimately a larger share of the subject than he does when he must read on a comparatively minute portion of a large class enterprise.
5. It is much simpler to locate and procure the necessary material.
6. There is a much greater carry over from the project work to the regular history course, inasmuch as the seven or eight group studies supplement and illuminate a very considerable portion of the course.
7. The many difficulties encountered in coördinating the many different aspects of the single class enterprise, do not appear in the group project, inasmuch as each group proceeds as an independent entity.
8. There is less likelihood of disaffection and half-hearted endeavor which is often a resultant of lack of interest in the subject chosen. This state of affairs can easily occur when a majority decides on a single topic for the entire class. In the group project, also, like-minded students may may be much more easily brought together.
9. A wholesome spirit of friendly rivalry was evident among the different groups. The improvement noted from week to week in each project presented came as a result of taking advantage of the criticisms made concerning the efforts of the earlier groups. It might be an interesting

Scanned with CamScanner

commentary to make, regarding this point, that the one committee, dissatisfied with its efforts after viewing a few projects that were submitted later, asked permission to try its hand all over again during the Easter vacation period.

Limitations of the Group Project

The following seemed to be the greatest weaknesses of the group project:

1. The individual groups were, in general, made up very unevenly. Some were distinctly mediocre, while a few were quite superior. This would probably be the case regardless of the method of selection used, unless the teacher himself arbitrarily selected the committee.

2. The committee manuscripts were of widely varying degrees of merit, depending largely upon the factor mentioned above.

3. The committee products were, without exception, far inferior to the results obtained in the class projects. This was true, not only from the point of view of intensiveness of treatment, but also with regard to such formal elements as style, and the many artistic and mechanical considerations.

4. There was evident, in many cases, a lack of interest in what the other groups were doing, except where it was possible to gain ideas for their own jobs.

5. Details including such items as typing, providing illustrations and cover designs, and binding were, in general, more troublesome than would have been the case in the class project.

6. Less valuable training in the elements of research is possible since students can locate material without any trouble and there is no real motive for desiring to learn about the methods and materials of historical research.

Subjects Chosen

The subjects chosen as the bases of the group projects described were:

1. The Critical Period of American History.
2. Famous American Statesmen.
3. Colonial Times.
4. The Constitution of the United States.
5. The War of 1812.
6. The Mexican War.
7. The History of Slavery in the United States.
8. The Evolution of American Industry.
9. The Life of Abraham Lincoln.
10. The Territorial Expansion of the United States.

Organization of a Typical Group Project

The following is taken from the table of contents of the committee manuscript "Colonial Times."

Teaching the Use of the Past Participle in French

The position of the past participle in the compound tenses has always been confusing to beginners. The following method has been found particularly effective in fixing the position of the past participle.

After having developed the latter in each of the three conjugations, we then review the present tense of "avoir." Then one child is called out to stand in a corner of the room. The class is informed that John Brown's name is no longer John Brown, but "donné," let us say. Everybody else in the class is some form of the verb "avoir" in the present tense. The students realize that "donné" cannot say his name until "avoir" has spoken his. Then all except the class calls out "J'ai," upon which "donné" steps forward and calls out his name. Then we continue with the rest of the conjugation in the affirmative. This is repeated in the interrogative, negative, and negative-interrogative forms, either in concert or by calling on individuals for "avoir" and asking the past participle to speak up after "avoir" has completely finished his full name.

The same is done changing to the use of various participles and at the end of a quick drill the students clearly see how the *passé indéfini* is to be formed, or, as a matter of fact, how any compound tense is to be formed.

MARIE ZULYEVITS.

John Adams High School.

EDUCATIONAL NOTES AND ANNOUNCEMENTS

Facts About the High Schools

More than one-fourth of all the 23,930 public high schools in America are located in five States: Texas, Ohio, Pennsylvania, Missouri and Illinois, the Federal Office of Education announced today in a report on public high schools for 1929-30. Texas high schools reporting totalled 1,400; Ohio, 1,322; Pennsylvania, 1,185; Missouri, 1,063; and Illinois, 1,065.

Fourteen other States recorded from 500 to 1,000 public high schools as follows:

Iowa	991
New York	955
Oklahoma	911
North Carolina	901
Indiana	869
Michigan	784
Kansas	746
Mississippi	735
Kentucky	711
Tennessee	669
Nebraska	652
Georgia	585
Minnesota	576
North Dakota	519

Larger than any other public high school in the United States reporting to the Federal Office of Education was DeWitt Clinton High School (for boys) in New York City, with an enrollment of 10,059 in 1930. New Utrecht High School and James Madison High School in Brooklyn, N. Y., with enrollments of 9,944 and 8,711, respectively, were the next largest high schools reporting. Other enrollments greater than 5,000 pupils reported by public high schools (the average enrollment is 234) were:

James Monroe H. S.—New York City, 8,572.

Carl Schurz H. S.—Chicago, Ill., 8,106.

Theodore Roosevelt H. S. (Commercial), New York City, 7,845.

Erasmus Hall H. S.—Brooklyn, N. Y., 7,525.

High School, Jamaica, New York City, 7,002.

Thos. Jefferson H. S.—Brooklyn, N. Y., 6.970.

Girls Commercial H. S.—Brooklyn, N. Y., 6,899.

Austin H. S., Chicago, Ill., 6,547.

High School, Richmond Hill, N. Y. C., 6,402.

Newton High School, Elmhurst, New York City, 6,323.

George Washington H. S., N. Y. C., 6,223.

Washington Irving H. S., N. Y. C., 5,904.

Stuyvesant High School, N. Y. C., 5,861.

Julia Richman H. S., N. Y. C., 5,854.

Evening H. S. of Commerce, San Francisco, Calif., 5,728.

Evander Childs H. S., N. Y. C., 5,679.

Washington Irving Evening H. S., New York City, 5,615.

Walton Jr.-Sr. H. S., New York City, 5,585.

Arsenal Tech. H. S., Indianapolis, Ind., 5,421.

Boys High School, Brooklyn, N. Y., 5,311.

J. Sterling Morton H. S., Cicero, Ill., 5,167.

Lindblom H. S., Chicago, Ill., 5,153.

Franklin K. Lane High School, Brooklyn, N. Y., 5,149.

Roosevelt H. S., Chicago, Ill., 5,102.

Albert G. Lane H. S., Chicago, Ill., 5,037.

Many public high schools have large enrollments, the Office of Education report indicates, but approximately 75 per cent of them enroll only 200 pupils or fewer. The majority of these register fewer than 100 pupils. America's total enrollment in 1929-30 in all types of public high schools, records show, was 5,465,932. School enrollment of children 15 to 18 was approximately 50 per cent of the total number of children of that age range recorded by the 1930 Census. Two-thirds of this group attended regular high schools, while the other third went to reorganized high schools (the junior high school, junior-senior high school or the strictly senior high school). More than 71,000 were attending high schools offering only abbreviated 1, 2 or 3 year courses of a regular 4-year high school program of studies, necessitating their attending another school to get additional work for graduation.

Public high schools graduated 591,-

Scanned with CamScanner

719 young men and young women in the year 1929-30. Forty-six per cent of the graduates of city high schools were boys and 43.5 per cent of the graduates from rural schools were boys. Nearly half of the graduates continued their education the year after they left high school.

Among other significant facts set forth in the Office of Education's report of public high schools are: The percentage of boys attending college has shown a decrease, and that of girls an increase from 1921 to 1929; the number of public high school teachers has increased 115,652 in a decade; 1,382 high school pupils of every 10,000 had an opportunity in 1930 to attend a public high school for more than 190 days; and 6,013 high school libraries were reported in 1930.

REVIEWS

The Way Out of Educational Confusion

By John Dewey. Inglis Lecture, 1931. Harvard University Press.

Many are the ills which beset the pedogogical flesh today. But few there are who can minister to its maladies, and even fewer who can precisely mark its ailments. Professor Dewey, however, in "The Way Out of Educational Confusion," successfully essays a sound diagnosis and therapy. Not all the causes of contemporary education malaise are adduced. Professor Dewey merely treats of what he considers the three influences contributing most heavily to our educational disequilibrium.

He first raises the point that educational leaders and curriculum makers are filled with much uncertainty as to what basic principles shall determine the content and approach of subject-matter. This fundamental bewilderment leads to a classifying of "subjects" which has little value or relevance. "Courses" similarly designated have little in common. Titles become meaningless, for they stand as symbols of no definite entities. The onus does not fall entirely on our educators. The problem is ultimately referable to the larger academic world where there are even greater divergences on first principles. The pedagogue, however, cannot escape censure for maintaining the old categories of "subjects" when the base of knowledge has shifted or altered. Standardization and labeling are to a degree essential. But organizing our present knowledge under old rubrics and principles is myopic policy, destructive of the most efficient transmission of the content and significance of education.

Professor Dewey's second point, although not an entirely new one, is of utmost importance. The old classical curriculum with its intense, narrow disciplines, and its rigidly circumscribed subject-matter, has been superseded by a meaningless multiplication of "courses" aimlessly spawned in a feverish desire to secure a proper alignment between an archaic curriculum and a rapidly changing civilization. To meet the ever-increasing complexities of the times, the curriculum has been "fractionized" or compartmentalized. This has led to the tragic superficiality of what is dignified with the name "education." Where the old curriculum taught much about little, the new teaches "less and less about more and more." The interdependence of learnings is not fully recognized; meanings are not integrated; a coherent, intelligent, and intelligible philosophy is nowhere articulated. Learning takes place *in vacuo*, and has little personal or social pertinence.

The last part of Dewey's analysis deals with the conflict between the "practical" and the "liberal" viewpoints in education. The cultivation of what Santayana calls the "genteel tradition," apart from its application to the life around us, produces an attenuated intellectual leisure class, decorative but useless. The pursuit of the purely practical untouched by the liberalizing outlook of humanism, tends towards "the brutal and inhuman." A culture divorced from the main stream of life has no excuse for being. A practicalism disdainful of the cultural view bears within itself the seeds of its own decay. A permanent separation here is unthinkable if education is to fulfill its noblest purposes.

As a way out of our dilemmas, Professor Dewey urges the clarification of educational aims and procedures, a more realistic view of the nature of knowledge, and of the learning process, and a more meaningful linkage of the individual's education with the life around him. Education must be a process continually bringing the individual into a more intelligent, more purposeful harmony with his environment.

While this slim volume reveals no radical development in Professor Dewey's philosophy, it is an eminently valuable discussion of a subject much talked about, but little understood. It is a sane, dignified, urbane and quietly eloquent treatment. Its utter lack of affectation is a welcome relief from the welter of pompous preening which clutters up so much of our educational journals, texts, and treatises. Professor Dewey's style, usually a formidable barrier between author and reader, here seems to have lost much of its opacity and knottiness. Although a bit murky and gnarled in spots, the texture of his writing, like his thought, has become more resilient and supple. His uncompromising vision, with its limitations, is still preferable to the prettier expediencies of lesser men.

A Contribution to the Theory ... Practice of Parents Associations

By Maria Lambin Rogers. United Parents Associations of New York City. Fifty cents.

Among the several progressive movements in education in New York City, undoubtedly the most forward-looking is that of the United Parents Associations. At a time when all the gains in education that have been won during the last decade at the expense of great effort, energy, and money seem about to be set aside by those who are crying for economy and saving, only the voice of the parents in this federated group is being raised in protest that is both vigorous and well-defined. "Our children must not be sacrificed on the altar of political greed and municipal corruption. Our children must not be crowded into classrooms. Our school building program must go on. The morale of the teachers must not be undermined by a destruction of the equitable salary schedules that we have set up. If we are sincere in our efforts to keep our children safe from injury and death on our crowded city streets, we must not give up the afternoon play centers in the schools. Child guidance, health promotion, vocational service for juniors, better articulation between junior and senior high schools are needed more than ever."

The writer has been privileged to attend the testimonial luncheons given annually by the U. P. A. to the members of the Board of Education and the Board of Superintendents. These searching souls of the parents, teachers, supervisors, and administrators, all of whose efforts and interests center in the children of our great metropolis. The frank discussion of problems and questions put before the heads of our vast school system have made these gatherings the outstanding feature of Open School Week.

What is the U. P. A.? How did it come into existence? How has it grown to its present state?

One thing is certain—it has not grown like Topsy. On the contrary, it has been a studied growth which has followed lines laid down as a result of careful, intelligent planning by experts in the field of parental education. And now its thrilling history has been told in the eighty-page brochure, prepared by Maria Lambin Rogers, who was the first executive secretary of the organization.

Read this remarkable story and you will learn at first hand the theory and practice of parents' associations of all kinds. The reader is carried down the years beginning with the old-fashioned coffee "klatches" and mothers' clubs that were mere adjuncts to school life, to the ideal modern parents' groups fully organized to render services of a varied nature. What impresses one most is the emphasis that the U. P. A. has placed on the organization of child study groups, the training of lay leaders, the scientific planning of programs for discussion. And wonder of wonders, the U. P. A. has its five-year plan! Those of us who were privileged to attend the series of conferences of parents, educators, and experts who worked on this plan will watch with interest the continued growth of the federated parents' groups.

Of what interest is all this to those who are connected with the high schools of our city? Just this: the U. P. A. has until recently been concerned only with the problem of the parents' association in the elementary school. In the last few years the movement has spread to the secondary schools because many of our high schools have gradually lost their cosmopolitan aspect. Except for such specialized schools as Stuyvesant, Textile, or Commerce, we have developed institutions like Evander Childs, George Washington, or Abraham Lincoln which are distinctly neighborhood schools. Parents have a greater community interest in the school, for it is near their homes. There are no long distances that must be annihilated. The contacts are closer among teachers, parents, children, and all welfare and communal agencies that are near the school. Parents who have been trained in the new theory and practise of parents' associations in the elementary schools now look for the same kind of association in the high schools to which their children go. Whereas four or five years ago there were two or three parents' groups in high schools, we have today eleven associations of one kind or another. More and more high school heads and faculties are beginning to realize the need for some kind of an organization that will win the coöperation of parents in the struggle against overcrowding, juvenile delinquency, etc. So great has this need become that the U. P. A. has been called upon to organize a series of conferences for the purpose of providing a clearing house for the solution of the pressing problems that have forced themselves upon the organizers of parents' associations in high schools in every part of our city.

For all of us, therefore, who are connected with the high schools, for all of us who are vitally concerned with the organization or conduct of a parents' association, this pamphlet published by the United Parents Association will prove to be just the thing that we need to help us in our work. A glance at the chapter headings will convince you:

When Spain Was Young

By Frank Callcott, Ph.D., of Columbia University. Robert M. McBride and Company, 1932.

Here we have a correlated Spanish reader that young people will enjoy reading. The author has chosen five universally known legends in medieval Spanish history and in clear, vigorous language they have been retold for our young students. Professor Callcott states that he had in mind "especially the young people who are beginning the study of Spanish," but his readers will not be limited to that group alone.

The book will appeal to maturer students because the material has been drawn from pure Spanish sources. The author's scholarship has led him to such works as

La crónica de 1344,

Poema de Fernán González,

Historia de España, Juan de Mariana,

La leyenda de los siete infantes de Lara,

Poema de Mio Cid, edition of Menéndez Pidal,

La crónica general of Alfonso X the Wise,

Crónica sarracina o crónica del Rey don Rodrigo con la destruyción de España, Alcalá edition.

It is always gratifying to lovers of the culture of Spain to see her literary monuments as they are and not through the eyes of unscholarly commentators.

The five hero stories chosen by the author are from the pre-Renaissance period, namely:

I. Roderick, the Last King of the Goths.
II. Pelayo.
III. Bernardo del Carpio.
IV. Fernán González, Count of Castile.
V. The Seven Lords of Lara.

All these heroes were "warriors, powerful men daring and bold in battle" (page 3), resourceful in the management of their affairs, simple in their religious fervor. In their treatment of an enemy they were purely medieval. They would heap honors on a fallen foe (page 177) or wreak appalling vengeance on near kinsmen for some fancied wrong (page 266).

I. *Roderick, the Last King of the Goths.* There are six known old ballads on Roderick and the loss of Spain to the Moors. There are also countless versions in Spanish as well as in foreign languages (*e.g.*, Victor Hugo: Bataille perdue—Les Orientales XVI). All agree that Roderick was a "weak brother," yet he remains a hero to Spaniards after all these centuries. All his weaknesses are forgiven because of his stout heart.

II. *Pelayo.* The story of Pelayo is the story of the beginning of the reconquest. By secret meetings in the mountain fastnesses of Asturias and by trusted messengers Pelayo rallied the Christians to his cause and began the long struggle to free Spain from the Moorish invader.

III. *Bernardo del Carpio.* The author retells this story of filial love. Young Bernardo reared at court as heir to the king, his uncle, learns that the king had for years held don Sancho, Bernardo's father, in prison at the castle of Luna. He swears to rescue his father and to avenge him. After years spent in the king's service, Bernardo demands the release of his father. The king complies and delivers to the young knight the lifeless body of his father.

IV. *Fernán González, Count of Castile.* The story of Fernán González is the longest and most spirited of the five. This is a great favorite among Spaniards, probably because this brave Count in his disregard of all hardships, his relentless pursuit of his enemies, his dauntless courage in the face of seemingly insuperable obstacles, forecasts the spirit of the conquistadores. By his ceaseless warfare, his shrewdness and wisdom, Fernán González laid the foundation for the future greatness of Castile. Toward the end of his life he succeeded in freeing his country from subjection to the crown of León.

V. *The Seven Lords of Lara.* This grim tale of a woman's hatred and thirst for revenge is sympathetically treated.

The story of the incredible activities of these old Spanish heroes forms a lively and interesting narrative. This reviewer, to whom these legends are a twice-told tale, was so entertained by the story that she completely forgot the manner of the telling. There is also an interesting side light on the feeling of the Spaniards for their Moorish conquerors, "the enemies of their holy faith." While there was more or less continuous warfare, there were periods of peace when Christians and Moors enjoyed friendly relations. They intermarried, intermingled freely, and admired one another extravagantly. At one time our author tells us the Christians looked upon the Caliph at Córdoba as an arbiter of disputes.

This reviewer has just read Hemingway's "Death in the Afternoon," in which the author tells us about bulls, all he has seen with his physical eyes—but tells us nothing about Spain and nothing about Spaniards.

These tales of Spain's early heroes tell us much about the Spaniards of today by showing us vividly the virtues and characteristics that Spaniards admire today and have admired through the ages.

This is a book that every teacher of Spanish should own, if only for use on those "blue Mondays" when teacher and class are in need of inspiration.

A CALL FOR LEADERS

THE leadership of the school in a changing society issues a vital challenge to teachers. It means that the teachers must become leaders. This means teachers at every level—elementary, secondary and college. The new society which is approaching promises a new day for elementary education. Schools today are handicapped by overcrowding and overenrollment. Teachers long for the smaller class which they find essential to newer methods. This involves a larger teaching force and so higher school costs, the dismay of any school administrator. But let teachers be comforted. In a society in which education becomes the very breath of life expenditure will be forthcoming. It must be forthcoming. We must spend more and more money on education, and give it higher and higher status among us. Whereas the school administrator of a previous era struggled to set up public schools, the administrator of today must struggle for good schools, schools with a full quota of teachers which will reduce the size of our classes to twenty-five. Under such conditions the schools may become a social organism charged with the dynamic of children's lives.

Because there is an oversupply of teachers schools can demand good teachers. In a day of technological unemployment schools can have their pick. We see ahead a society in which the best of us must be in the service of education. The vast armies of the unemployed are unemployed permanently, as far as the mechanical needs of an industrialized society are concerned. . . . No longer have we the cry of not enough teachers. Today there is no end of teachers. What then shall the schools answer to the call of society to employ its young? It must say, and it will say, here is a realm in which we may employ and employ until our classes have been established in the small units which are essential, and become a basis of small group democratic living. We must employ and employ until our schools are equipped with an adequate supply of doctors and nurses and psychologists and psychiatrists and visiting teachers and specialists in all the arts of painting, music, poetry and sculpture. Only then, by nursing the social organism may we develop into a society which is fully formed and strong.

THE SEWARD PARK HIGH SCHOOL GUIDANCE BUREAU

Several illuminating articles on Child Guidance were published in High Points and in *The Principal* with which the Seward Park Guidance Bureau is in such complete accord that we avoid repetition by discussing mainly the Guidance Bureau at the Seward Park High School, describing its functions and adding a few illustrative cases.

Childhood development as a country-wide movement is a post-war phenomenon. It started in hospitals and clinics and worked its way to the Children's Court. The year 1922 marked the great growth of the Child Guidance movement. Then the National Committee for Mental Hygiene, supported financially by the Commonwealth Fund, organized the Institute for Child Guidance, a laboratory for training and research, having on its staff pediatricians, psychologists, social workers, statisticians, research workers and psychiatrists. This group felt, in common with others, that the school is a manageable environment for Child Guidance. By using the schools as its medium, it stimulated visiting teachers with an experimental attitude in their courses in mental hygiene.

It was during this year that Mr. Robert B. Brodie, Principal of Seward Park High School, appealed to Mrs. Sidney C. Borg of the Jewish Big Sisters, for a mental hygiene service in his junior and senior high school, and in 1925 he succeeded in his efforts. The Guidance Bureau thus became an integral part of Seward Park Junior and Senior High School, a school which was always interested in social problems and which had the guiding influence of men such as Dr. John S. Roberts, now District Superintendent of Schools; Dr. I. Edwin Goldwasser, an educator; and Dr. Leon W. Goldrich, who is now Director of the Bureau of Child Guidance, Board of Education.

At the inception of the Bureau, Mr. Brodie assembled the heads of departments, grade advisers and deans, with the Bureau staff. Mr. Brodie, whose aim is to make the school pupil-centered, outlined the school organization: teachers, administrative assistants, grade advisers, deans, the chairman of the scholarship committee, the placement and investigation secretary, and so forth. In his address to the Bureau staff, explaining the functions of each member, he emphasized that each pupil is a living organism around which is built, in addition to an educational program, an individual personal service. Then he explained to the school staff the set-up of the Bureau, a department of the Jewish Board of Guardians, supplying a Director, psy-

Scanned with CamScanner

chiatrist, psychologist, two psychiatric field workers, volunteers and an office staff, making the Guidance Bureau the capstone of the high school advisory system. In addition, a staff of volunteers composed of chairmen, and senior and junior members of the Board, who are engaged in active case work, was established. A number of the members have had scientific training, and the others are being trained in the office by the staff. Their duties are as follows: 1. Case work; 2. Scholarship; 3. Rehabilitation; 4. Relief. This double set-up is a unique feature of the Bureau.

By integrating the specialists of the school with the Bureau staff, Mr. Brodie outlined a plan for referrals, which in essence would be a sifting process whereby only those problems would be referred to the Director which were beyond the scope for readjustment or treatment by the staff members and where intensive study was required. Mr. Brodie further explained that the Bureau was not a panacea for all ills, that among the cases referred to the Bureau there would obviously be a number of untreatable ones. These would be referred to mental hygiene or neurological hospitals, either for coöperative or full service.

In the past seven years the teachers have had closer contact with the Bureau, have taken part in conferences with the staff, attended the biweekly seminars given by the Bureau, and taken courses in mental hygiene, a number of which were especially arranged by the Bureau to meet their specific needs. Many of the teachers now are qualified to select suitable problems for Bureau study. Mr. Brodie is at present giving a course in the Conduct of a School Guidance Clinic for teachers and specialists in the mental hygiene field.

The student is referred to the Bureau in the following manner: The dean or head of department comes to the Bureau with a written preliminary statement of the problem gathered through the grade advisers from the teachers and discusses some of the outstanding difficulties with a member of the Bureau staff. He later introduces the student to the worker who will study him. The student is asked to be seated and soon realizes that the Bureau is not a punitive organization. The worker makes him aware of her interest, but assumes a passive role in order to give him free rein in discussing his problem from his own point of view. After the child leaves, the family is cleared through the Social Service Exchange to find out whether other agencies have been interested in the family. Contacts are made with those agencies which are interested in the case. His teachers are all interviewed and appointments are made for psychological and medical examinations. The members of the family are seen individually at some time by the psychiatric field worker, who obtains the social history after several visits, some of which last many hours. At the present time, the more experienced workers are testing out unfolding histories

using no scheduled routine of questions, but permitting the families to "talk themselves out" in the present situation. In the course of time, through occasional leads from the worker, the members of the family give much of their history. In these histories we get the background of all the children in the family and the parents' early childhood, which is frequently the basis of a child's difficulties. "Parents, too, are people"—little children grown up—suffering from the handicaps of their own upbringing, their prejudices and difficulties, which react on their children. Experts in the field of human relations tell us "the entire field of parent-child relationship must be considered, as this relationship begins before birth and lasts throughout life, even after the death of the parents." The children are fundamentally what their parents have made them and keep their impress for the rest of their lives. The results are frequently mirrored in the children's behavior in the school and with their companions. Parallel behavior is almost classical in the Bureau findings.

When adequate material is obtained, it is dictated into the record and submitted to the psychiatrist, who sees the patient in an interview of about three-quarters of an hour, gives his psychiatric impressions and arranges to see the child again if intensive psychiatric treatment is indicated. Ordinarily, he gives his recommendations to the worker, who, in consultation with the psychiatrist, gives her results in therapy. The school administrators are informed in regard to the progress of the case. Coöperation is always essential.

New cases are later brought up in the discussion group of the weekly seminar, to which heads of departments, deans, teachers and liaison officers are invited, together with the staff of the Bureau, the attendance officer in the school, the Crime Prevention Bureau, and others. Here an entire case is read by the worker to whom it has been assigned, followed by active discussion and summary by the psychiatrist or director.

AUGUSTA SLESINGER,
Director of Child Guidance.
Seward Park High School.

STORIES TO ILLUSTRATE THE PLAN OF THE BUREAU

I. John's mother came to school to report about his behavior, which she considered impossible for her to handle. She was referred to the Guidance Bureau at a time when the Director was not in. The situation seemed an emergency one, and so the worker saw the mother.

Interview

The mother was given every opportunity to unburden herself, the worker interrupting her only when it was necessary to verify the facts. According to the mother's reports, John was the worst boy imaginable. He beat her, refused to obey her, and today threatened to take her life. He got into the most terrible temper outbursts, mistreated his younger brother, stayed out late at night, and would

Scanned with CamScanner

never help in the house. The mother was quite sure that her son intended to kill her that very day. Something of the home conditions were learned during this first interview, and the outstanding thing seemed to be that the family was suffering from dire poverty, whereas two years ago they were in comfortable enough circumstances to have a car and a maid. The worker assured the mother that the boy would be interviewed before he departed from school that day, and that if the Bureau felt that it was necessary, the boy would not be returned to the home that night. The worker promised to get in touch with the mother as soon as she had interviewed the boy.

The boy was sent for, and to all appearances, he was friendly, coöperative, and completely opposite to the mother's description of him. He was lame as a result of infantile paralysis, with which he had been afflicted at an early age. He seemed to be making the best of his handicap, however. John was asked to tell his story, and he revealed the fact that a younger brother at home, who was very mischievous and troublesome, got the mother so upset that she did not know what she was doing most of the time, and since she could not give vent to her anger by "taking it out" on the younger brother, she always looked for trouble in John. John assured the worker that he would behave himself, and that there would be no fights between him and the family until the worker could see both him and his mother again.

Social History

A social history was then taken by the worker, and the following are some of the salient facts that were obtained:

The mother came from a very poor family, and had to go to work at a very early age. She married the father when she was quite young, and at first their life together was quite a struggle. The father died of influenza at the age of twenty-seven. John was three years old at this time, and the mother made every effort to support herself and her baby. When John was five years old, the mother re-married. The step-father was fairly well off financially, and the mother was quite happy with him. About a year and a half ago, the father was induced by a maternal uncle to invest all of his money in the uncle's business, and to do this, the father gave up his job, and moved to another city to join this uncle. The business failed, and the father lost everything he had invested. Thus, from their former state of comparative wealth, this family was reduced to circumstances of real want. Just previous to this financial breakdown, another child was born. This child has been very backward in its development, has only recently learned to walk at the age of two and a half, and can hardly talk yet. This little boy has furious temper tantrums, insists upon having his own way in everything, and very easily excites the mother. It was obvious that John was having a very hard time adjusting to the new financial circumstances, and also coping with the younger brother's behavior. At this time the father was out of work, and the family had just about completely exhausted its savings.

Physical Examination

A physical examination was given to John, and when it was learned that he needed a tonsillectomy, this was arranged for and successfully carried out during the process of treatment. On several occasions since John has been known to the Bureau he has been ill, and each time he was referred to the Visiting Nurses for care. The younger brother was also examined at several hospitals because of his slow development and apparent poor health. There was some difference of opinion as to the advisability of removing this child from the home because of the possibility of his being mentally defective. However, no definite step has been taken yet on this issue.

Psychological Examination

A short time after John was referred to the Bureau, he was given a psychological examination, which showed that he had good intelligence, and that he was well fitted for the course in accountancy which he was pursuing. Arrangements were also made to give the younger brother a psychological examination, and the results of this examination indicated that the boy was not defective, but merely retarded.

Psychiatric Interview

John was seen by the psychiatrist on several occasions, during which interviews he discussed his attittude toward his parents, his younger brother, his ambition for himself, and the conflicts in his own mind. John enjoyed these discussions and seemed to benefit from them greatly. When he last saw the psychiatrist he was able to admit that things had improved a great deal, but he frankly confessed that he did lose his temper occasionally. He seemed to have a very objective manner toward his own difficulty and was therefore able to help himself to a very large extent.

Diagnosis and Interpretation

It was immediately realized that the economic situation was one of the most important factors in this case. The Bureau had to keep this constantly in mind in planning treatment for the family. The younger brother was creating a great deal of the difficulty for the family, and it was really he and not John, who needed the therapy. While the conflict between John and the mother was current, it was felt advisable to keep them separated as much as possible until the immediate home difficulties could be straightened out.

Social Worker's Contacts—in School

John's teachers, on the whole, thought he was a very fine boy. He was employed in the school lunch room for three periods, in return for which he received his lunches free. When the financial situation at home

Scanned with CamScanner

became so acute that John was not getting sufficient nourishment outside of school, the teacher in charge of the lunch room was appealed to, and special arrangements were made to give John his breakfast in school, and also give him some nourishment before he went home. On Fridays, he was usually given a supply of food to take home. Through the coöperation of the Social Service Department in the school, John was given a complete new outfit of clothes. Later on the financial situation in the home became so desperate that the Bureau made a special appeal to the Principal so that some support would be given to this family. The Principal, after carefully studying the case, recommended that the school appeal to the Jewish Social Service who had already refused to assist this family when they applied for help on their own initiative. This was done, and the Jewish Social Service assumed an active interest in this family until the father was able to secure a job.

Social Worker's Contacts—in the Field

A recreation club was suggested to John, which he joined. In order that John might feel a little more secure as to his financial position, he was given a job in the Bureau, running errands, and doing some typing. He was always found to be extremely helpful and coöperative in the office.

Efforts were made to get the father work, and on occasion he was given a few days' employment. One of the greatest difficulties was to try to get the parents to realize that the problem was with the younger brother, rather than with John. Although they are aware of this fact now, as a result of long and patient explanations, still they are unable to do anything about this child.

During the summer, arrangements were made to send John to camp for the entire time, so that he could be away from his family, gain strength, and form good contacts. At camp, he entered into all the activities and proved to be one of the best all-around campers. While he was at camp, he took an active interest in the boys who were also cases of the Bureau, and at the worker's suggestion he sent reports to the Bureau on these boys.

John has felt free to come to the Bureau at all times to discuss any home difficulty, and he has always been frank and very coöperative in his manner. The father is now working, which has relieved a good deal of the tension in the home.

Results

John is no longer a problem to his family. His behavior is out-going in every respect. He has made an excellent adjustment and is well liked by every one. He is one of the most coöperative youngsters that the Bureau has ever known. The case will remain open while John is in school, as it is felt that the Bureau means something to him that has a real positive value. Although there will probably be no more positive treatment, the fact that John gets a certain sense

of security from the Bureau is enough justification to keep the case open and maintain a frequent but casual contact with John. He has never felt it a stigma to be known to the Bureau, but is really very proud of his contact with it.

II. Robert was referred to the Bureau by the librarian, who had come in close contact with the boy as he spent a good deal of time in the library, reading books that had to do with the army and army life. This boy's one ambition was to go to West Point and he fell short of their requirements in every possible way. The librarian, realizing that Robert would be rejected, wanted him to have assistance in facing this issue.

Interview

A friend of Robert's, who was very much interested in him, was interviewed first by the worker. He described Robert as a very much undersized, undernourished boy who had numerous physical handicaps which would naturally prevent him from attaining his goal. He gave a general summary of the boy's life and the home environment so that the worker would have something tangible on which to base her interview with Robert.

Before the boy was interviewed, two teachers who were interested in the boy were seen, in order to ascertain their attitude and to obtain any pertinent information that they might have about the boy. It was learned from the physical training teacher that the boy had asked for assistance in order to increase his height—a requirement which he would have to fulfill in order to get into West Point. The teacher suggested the name of a doctor whom he might see concerning this. The boy's grade adviser was also interviewed, and he recalled that on a boat ride on which the school had gone, Robert had left the group and had visited West Point.

The Bureau thus knew something of Robert before he was seen. He was sent for by the worker and it was explained to him that the Bureau was particularly interested in students who wanted further schooling, and that the Bureau had learned from the librarian that he was interested in going to West Point. Naturally, Robert was suspicious of this as he had undoubtedly been questioned by many people before. The worker made every effort to encourage the boy to discuss his ambitions for West Point. It was evident from the first interview that the boy was greatly conflicted and upset because he was aware of how unobtainable his ambition was. He was very much on the defensive and rationalized each specific reason why he might not be able to enter West Point.

Social History

It was realized from the outset that in order to obtain this boy's confidence the Bureau would have to go very slowly in handling the entire situation. The home visits had to be made carefully and planned so that they would not arouse the boy's suspicions further.

Scanned with CamScanner

The following facts were learned and pieced together after several interviews: Robert was the youngest of five children, all of whom were born in Austria. He was one of a pair of twins, the other one dying a few weeks after birth. The parents were always very poor and lived through tragic experiences during the War in Europe.

The family came to the United States when Robert was six. Up to that time he was barely able to walk as he had a severe case of rickets. He never had any friends and stayed in the house all the time. He did very well in school when he first started, but toward the upper grades his interest began to wane. In his high school work he has failed almost continuously. He thought he would be able to make up his failures in preparatory school, as he wanted to concentrate for the immediate present on developing himself physically so that he might enter West Point.

Members of Robert's family are very religious adherents to the Hebrew faith. They have never permitted their children to work on Saturday. West Point, of course, sounded to them as a most ridiculous thing and they did everything in their power to dissuade the boy. The more they argued, the more he insisted. The family were desperate and were willing to do anything that would keep the boy from going to West Point.

Physical Examination

Robert had been going to see several doctors in order to improve his physical condition so that he might enter West Point. The Bureau immediately got in touch with these physicians in order to learn what was being done for Robert. It was ascertained that although these doctors were trying to discourage him from going to West Point, they all were trying to help him develop physically. Thus, it was felt that he was being adequately taken care of as far as his physical condition was concerned.

Psychological Examination

In order that the Bureau might guide itself as to the possible channels into which Robert's energies might be directed, arrangements were made to give him a psychological examination. The examination revealed good general intelligence plus excellent mechanical ability.

Psychiatric Interview

Robert has been seeing the psychiatrist almost weekly. His transference to the psychiatrist has been excellent. The psychiatrist has spent most of the time trying to explain to the boy, or rather getting the boy to understand, just what is at the base of his intense desire to go to West Point. A good deal has been accomplished. Robert has not given up West Point, altogether, but he is at least concerning himself with the present more than he ever did and he has a very thorough understanding of just why he wants to go to West Point. He will continue to see the psychiatrist.

Diagnosis and Interpretation

Robert was disturbed emotionally. It was realized that West Point was his solution for all of his problems and conflicts. He felt inferior in every way in comparison to members of his own family and his associates outside of the home. He had created a fantasy for himself in which he saw himself as a perfect individual in regard to health, build, education and position. In this way he was able to escape reality.

Social Worker's Contact

The worker's first job was to get Robert to feel that the Bureau was in no way critical of his desire to go to West Point. This was not accomplished until after several weeks had passed. At the close of school in the spring, the Bureau was able to get Robert a temporary job. He left home and went to live first in a boys' club and later with the dentist who was treating his teeth. The dentist was intensely interested in Robert and was doing all the dental work free. Robert lost his job at the end of the summer, as it was only a temporary position.

The Bureau's next step was to find for Robert a satisfying substitute for high school to help him give up his fantasy of wanting to go to West Point. Efforts to get him another job proved futile. Although Robert had refused any suggestion connected with radio work—a thing which he was well up on—he was finally persuaded, after the Bureau had arranged for a scholarship, to attend the Y. M. C. A. radio school. The principal at this school is intensely interested in the case and is hoping that he can divert Robert's interest in military things to naval radio operation.

Robert is working on a newspaper, writing a radio column. He is not being paid for this at the present time, but is in hopes of getting some remuneration in the future. Since he is attending radio school at night, he hopes to get some paying job during the day. It has been necessary for Robert to return to the home because he cannot support himself outside, but it is felt that he will return to his family with a more adult attitude toward them.

Results

This case is still active with the Bureau and our contact will continue. It is felt that Robert is much improved, but there is still more to be done and the Bureau is in hopes that it can help Robert to face reality.

HILDA LEVY,
Psychiatric Social Worker.

GUIDANCE AS A DYNAMIC PHASE OF HIGH SCHOOL LIFE*

If David had come to you with his engaging smile to say that now that he had "seen life" he was going to settle down to the business of a high school education, you would have found out after a little while, just as we did, that David had it in him to sway the multitude of high school students, and that his powers of leadership were considerably enhanced by the ten days he had spent in jail. There are, I venture to say, very few teachers or administrators in the forty-two high schools of New York City who would not have worked, as we did, to get the confidence of not only David but his first lieutenants; and to swing their admirations and loyalties away from lurid experiences and the gang to valid adventure and the school. With the result that, instead of plotting to get into jail for the Christmas holidays, they are going to get their excitement from a series of interviews with big business men and news reporters.

And if Sadie's mother had groaned aloud at your desk over Sadie's spells of depression at home and chronic failure in high school, you would have discovered, too, that Sadie had a problem mother and that only good prospects of marriage for poor, pudgy, cross-eyed Sadie could do away with that mother's groans. You would have done the thing that common sense and understanding—or mental hygiene—dictated. Sadie's mother is slowly yielding to reeducation; ever so slowly, alas, for her old-world standards and attitudes on this subject of female destiny are deeply ingrained. She is becoming reconciled to Sadie's ambition to become a milliner instead of a wife at the age of sixteen. And Sadie is allowed to sit contentedly at home sewing away at her hats while her pretty sister goes to dances and the movies with one of several "boy friends."

And again, if Catherine had had what purported to be an epileptic seizure on three different occasions in your office, and if you had noticed that on each one of these occasions the "seizure" conveniently interrupted the performance of some duty especially painful to Catherine, you would have bent your efforts, too, to helping her develop a more courageous attitude toward her problems.

For every story of the effective handling of a student problem that I might tell you, experienced teachers here could tell a dozen stories illustrating the same points and indicating the same, if not greater, success. In other words, Guidance in the high schools of New York City is nothing new. Wherever a teacher has salvaged the best in a student and has inspired wholesome attitudes and habits and loyalties and better choices—and the number of such teachers is legion—there has been Guidance. Wherever a teacher of Civics has assisted in that creation of rich personality which the Commission on the Social Studies of the American Historical Association tells us is the supreme purpose in civic instruction; wherever a teacher of Spanish or French or German has created appreciation of, and therefore spiritual kinship with, other nations; wherever in a Mathematics class the imagination that builds bridges and airplanes, and tunnels, rivers and mountains, has been born—there has been Guidance.

And because of this realization by many teachers that Guidance has to some extent been an integral and essential part of all teaching of adolescent youth, this newest addition to our pedagogical vocabulary—*Guidance*—is an irritant as well as a stimulant. Misunderstanding arises out of the failure to recognize the manifold character of the Guidance function in the high school, and the ensuing necessity for organization.

Guidance is concerned, it is true, with helping students with every conceivable problem that they fall heir to—David's, Sadie's, Catherine's, and those of hosts of others. These problems may be predominantly vocational or educational, moral, social, emotional, or recreational, although such artificial divisions of Guidance, I think, serve little practical purpose, and if unwisely administered produce the very dualisms and conflicts that a Guidance Office exists to fuse. Such is the seamlessness (I coin this word out of the opening sentence of Professor Beard's "Charter for the Social Sciences") of human personality that it is not easy to draw the line at the place where the educational problem ends and the vocational begins. If, applying President Eliot's advice to the high school level, we give prominence to the life-career motive, as we should, these two types of Guidance are bound to overlap. William, pale little chap with heavily-ringed eyes, who comes to the Guidance Officer after an assembly talk on the choice of a vocation to ask how he may become a criminologist, merely grazes the surface of his real question, which is how to be able to continue his education in spite of a very bad home situation and ill health.

The Guidance Office is a laboratory for the complete understanding of the boy and girl. It is forced, naturally, to work to some extent with the pathological aspects of personality. But it is poor Guidance, indeed, that is content with stopping up the chinks in the walls, with forever picking off the bad apples. As a matter of fact, the chief significance of Guidance in a high school does not lie in its power to cure misconduct. There is no such power. And Guidance is not to be identified with discipline. Wonders are here and there accomplished in hardened cases by the methods and facilities of the Guidance Office, but they are the exception rather than the rule. Such cases demand the more specialized and exhaustive care of the

* An address delivered before the High School Teachers Association of New York City, December 10, 1932.

Scanned with CamScanner

mental hygiene clinic with ... of social case workers and psychiatrist. Guidance in the high school usually functions, in these cases, to reveal new possibilities of adjustment within the reach of the individual.

Just now, with life incredibly complex, with family relationships changing, with the "economic world breaking from its moorings," with uncertainty at every turn of the road, Guidance is a peculiarly indispensable function of the high school. There is need for the conscious concentration of all the resources of the school—curricular, extra-curricular, faculty personnel, student personnel—so that they may be made available to students for the planning of their lives today and tomorrow, inside and outside of the school building. The problem is one in human engineering. It requires organization for which administration must provide.

If this guiding of high school boys and girls is to be more than an amateurish procedure; if it is to develop techniques; if it is to be available to all students (not just those who happen to have the good fortune to come by it through the good offices of a teacher equipped with unusual insights and training), responsibility for it must be centered in professional counselors.

Professor Brewer tells us in his scholarly and understanding new book, "Education As Guidance," that although the planned interview, and the case study, and vocational placement are well worked out, there remain to be developed the great ma-

... Guidance techniques. The trained counselor must have for ... equipment existing techniques. But she must also have the time as well as the professional interest to push back the frontiers of knowledge regarding occupational information, group conferences, personality ratings, and guidance criteria, among other things.

Yet, with all the various services, goals, fields of interest, and specific influences that a Guidance program sets up, it cannot make good its claim to existence as a separate high school agency unless it furnishes consciousness of the interrelatedness of all the forms of Guidance as they apply to individuals. The insistent need of the student in the large school today, as of the citizens in a complex community life, is for balance among all its activities. And therefore the pulling into focus, for each one, of activities at home and in school, and wherever else they may be found, is the essential and distinctive guidance fuction.

The school does not go far enough when it excuses Benjamin, a cardiac, from physical training, but allows him to carry an extra major or run up and down stairs as a member of the traffic squad. It is guilty of lack of coördination when Ethel is given financial relief by one department of the school in order to ease the strain of her heavy home responsibilities, and at the same time is required by another department to attend the "afternoon session" which infinitely increases those responsibilities for her. The activities of

high school, by virtue of their volume and the size of the student body, require coördination and interpretation for individual students. If Guidance is a laboratory for the complete understanding of students, it is, as a corollary, the agency which must do its big share towards this coödination, towards this integration of interests.

We high school people are talking much nowadays about life situations in the school, and about the importance of training for habits, attitudes, and abilities that function in the lives of students, as distinguished from the mere acquisition of book knowledge for its own sake. I am far from placing responsibility for bringing about this happy state of high school education upon a few counselors when I say that a Guidance Department can be an invaluable aid to its consummation. But certainly it would seem that a properly-functioning Guidance Department is in a position to gather up a majority of the facts and points of view related to a problem, and to present them to students and teachers for their interpretation and decision.

The position of the counselor is strategic for work of this kind. She is, let it be remembered, a guide. She does not rely upon authority. She pools information, suggests possible lines of action, interprets their significance for individuals, but places responsibility for decisions squarely where they belong—upon the students themselves—thus providing life situations which are the setting for training in habits and attitudes that will determine choices forever after.

Needless to say, a guidance program is incapable of complete effectiveness unless it stimulates the participation of every member of the faculty. It may struggle to champion the students as individuals; it may call in the aid of specialists in all conceivable fields; may make less haphazard the student's chances of getting personal attention; may provide a place where problems may be freely discussed; and may even accomplish the all-important task of integration of activities. But unless it creates understanding of its aims, sympathy with them, and participation in them, by the teachers of the school, so that there is unity of purpose for the student concerned—Guidance may become but another appendage to an already-too-departmentalized system. Whether Guidance becomes a dynamo in the life of the high school depends not so much upon what the counselor does *for* and says *to* William and Benjamin and Sadie and Catherine, as upon the realizations it effects among administrators and teachers, athletic coaches and club directors, mothers and fathers, of what ought to be done and can be done *with* them. Perhaps its chief task, therefore, is to spread abroad its philosophy of success—though not in the ordinary materialistic sense of that word—to spread abroad its purpose of integration of personalities, of programs, of activities; to make better known its techniques. Will it thereby be working itself out of ex-

Scanned with CamScanner

istence? Eventually, perhaps; not so soon that we need abate our efforts, I am sure. But then it will have accomplished its purpose, it will have made Guidance synonymous with teaching in that the teaching process will be Guidance; it will, in a word, have become a dynamic phase of high school life. How to accomplish this end is my immediate problem at Samuel J. Tilden High School.

ELSA G. BECKER,
In Charge of Guidance.
Samuel J. Tilden High School.

WHAT TO DO WITH THE GIFTED CHILD IN SECRETARIAL STUDIES *

ABOUT a year ago I was appointed a member of the Committee of the Association of First Assistants in Secretarial Work to make a study of the opportunities for the bright child. I have centered my own thoughts on the problem and enjoyed the privilege of discussing it with my colleagues. We found that we had little precedent to guide us in our studies, and that giving special attention to the bright child might be considered a new phase of our work. We realized that, although the number of superior or exceptional children in the high schools is limited to a few, it is our duty to give those pupils every possible opportunity to make use of their special aptitudes and special talents.

The Committee of the Association of First Assistants in Secretarial Work set out to discover what provisions were being made in the schools at present, and secondly, to outline suggestions for the future care of gifted pupils.

In order to accomplish the first aim, the Committee sent out a questionnaire to all the high schools of the city, asking that the chairmen of the various high schools answer questions bearing on the subject. The answers to the questionnaire were somewhat meager and too varied to reach any definite conclusions. The Committee then considered the second aim of the investigations, namely, the recommendation of suggestions for the care and consideration of the gifted student in the future. As a starting point, superior students were divided into two groups; first, the very superior children, of whom there are very few in the entire city, and secondly, a type of superior student of whom there will be a group in practically every high school. Qualifications were set for both groups. It was suggested that one comparatively small class be organized for the very superior students of the entire city, meeting in some centrally located school, and that these students be given a special course of study, consisting of general cultural subjects, excluding all commercial subjects except law, shorthand or accounting, and typewriting. It is understood that this student will be prepared to enter college. It was suggested that the superior child be provided for in the home school; that he be given an enriched course of study, consisting of dictation material on literary work, legal work, and the more difficult types of business letters. General business processes and procedures should be considered. These pupils are expected to be leaders in the secretarial field. Those of you who are interested in a further study of the findings of the Committee are referred to their report.

Although a definite plan for the care of the gifted child has not yet been formulated, many of the suggestions made by the Committee are in operation in our Secretarial department at the James Monroe High School.

1. *Enrichment of Course of Study.* In our attempts to enrich the course of study, teachers are directed to discover superior or gifted students. We endeavor to give the gifted student an enriched course of study. This does not mean that he is permitted to double up or to enter accelerated classes. By an enriched course of study, I mean that a student is required to do more work than can be done in the regular course by the normal or average student, either in or out of the classroom. This extra work must be turned out satisfactorily. This assignment of special work requires ingenuity and initiative, compelling him to exercise his special abilities. It consists of problems which are more difficult, more complicated, and more involved, demanding earnest, conscientious, and painstaking study.

The dictation in the stenography classes is graded as to the length of the "take," difficulty of matter, and rate of speed. These factors are considered from the standpoint of the average pupils in the class. The exceptional student is required to take more difficult dictation at a faster rate of speed, and in longer stretches. In the more advanced classes, the exceptional student is required to make use of his shorthand by reporting assemblies, radio speeches, and the like. He is also expected to demonstrate secretarial ability by doing practical things, such as reporting lectures and assembly talks, transcribing instructor's notes on departmental or school conferences. Some of these students are expected to cut shorthand stencils for our shorthand publication, the *Monroe Gregg Journal*. They are urged to try for the Order of Gregg Artists, based upon accurate and artistic shorthand. The work of the bright students is displayed on departmental bulletins, classroom bulletins, in exhibitions at teachers' conventions and association meetings. This work is often very attractive and interesting, displaying unusual creative and artistic ability.

2. *Pupil Assistants to Teachers or Pupil Leaders.* The gifted students act as class leaders, sharing the responsibilities with the teacher in the

* Presented at a meeting of First Assistants in Secretarial Studies and Accounting on December 3, 1932.

Scanned with CamScanner

administration of the class and the conduct of the recitation. They are free to use their initiative in taking care of the class at the beginning of the period, sending pupils to the blackboard, checking the blackboard work, giving brief slip tests, and so forth. They serve as model secretaries or leaders, handling such routine matters as passing papers, distributing and collecting text-books, taking care of ventilation, and checking the homework. Their own work serves as a model in style of writing shorthand outlines, general accuracy, quality of work on the blackboard, and in the excellence of their recitations.

3. *Pupil Tutors.* The bright or gifted students are asked to assist the slow or average student who experiences difficulty. This assistance is given either during school hours, after school hours, at home, or during the classroom period when circumstances permit. By so doing, they themselves develop greater efficiency and thoroughness in the mastery of subject matter, greater self-confidence, and individual initiative.

4. *Reference and Supplementary Text-Book Work.* These exceptional students are required to use supplementary texts. The instructors give them special or individual instruction or explanation to guide them in this work. This extra work requires additional time and thought. Pupils are required to make use of their library reference reading and make a summary of their notes. They are required to read supplementary texts, magazines, library books, and pamphlets. Reports on these readings are neatly arranged in typewritten form.

5. *Contests.* Exceptional students enter the annual radio shorthand contests and annual City Gregg Shorthand contests. Inter-class contests conducted semi-annually bring to light our exceptional students. They serve as a stimulus to the students to put forth their best efforts. These pupils also enjoy the winning of the sixty, eighty, one hundred, or one hundred twenty word-a-minute Gregg Writer Transcription Tests.

6. *Secretarial Practice.* In the secretarial classes, the students are expected to make extended readings on special topics. They are also assigned to departmental offices where they have an opportunity to work in a natural setting. The theory work of the classroom in this manner is more deeply ingrained by practical application. Students are assigned to observe the work of the telephone switchboard in the general office. Those who show special ability are permitted to operate the switchboard, if they desire to do so. Occasionally, bright pupils are called upon to demonstrate the operation of various office machines.

Furthermore, these exceptional students do extra work in their free periods for teachers and special faculty advisers in charge of various activities, such as the school publications, the store, and the General Organization.

7. *Clubs.* Special groups of bright students get together after school hours to get practice dictation under a faculty adviser to enable them to take dictation at higher speeds on more difficult matter than is required in the regular course of study.

I have thus briefly outlined the various ways in which we are giving special thought and consideration to the bright student at the James Monroe High School, even though no definite plan of procedure has been adopted. Perhaps a study of similar procedures in other high schools may serve as a basis for the crystallization of an effective course of study, making special provision for the development of the gifted child.

EDWARD M. KANZER,
Chairman of the Committee.

James Monroe High School.

THE PROJECT METHOD AND MATHEMATICS

It has been remarked, with some justification, that the field of education is a breeding place of queer, whimsical fads and fancies. Various notions and ideas spring from its fertile soil to enjoy a brief period of reputation and popularity only to fade away eventually in the abyss of oblivion.

Few subjects of discourse in the field of method have precipitated as much discussion as has the project method and it is therefore inevitable that in so vast a literature as has been developed there will be found a considerable number of untenable theories.

Many weird pedagogical and psychological arguments have been advanced in support of what was supposed to be project teaching, while vain attempts to formulate projects have resulted in peculiar types and forms. Teachers have become bewildered and puzzled. What is meant by the project method? Is it a new method of teaching or is it a new fangled idea in curriculum construction?

These are the questions which have caused confusion to reign among the teachers.

In order to acquire a clearer conception of the whole problem, let us make a brief cursory examination of the historical background.

With the advent of 1900 we saw the beginning of the "New Education," the "New Philosophy," with John Dewey as the predominant figure in the movement. The words "self-expression," "self-realization," "initiative," and others, began to take on added meanings vital to the educative process of our youth, and became common talk in our enormously increasing literature. Virtually, it was the inception of modern teaching New ideas in pupil activity, pupil abilities, motivation, curricula making, and the like were received and accepted with unbounding enthusiasm Out of these new changes in ideas rose the Hydra-headed term "project."

Scanned with CamScanner

As far as I can ascertain, Richards was the first man to use the word. In his capacity as the Head of the Manual Training Department at Teachers College it was only natural that he could see only the manual or physical side of education. He used the word "project" in reference to the constructive abilities of pupils, so that they were given an opportunity to plan, to express themselves, to do problem solving thinking.

Immediately other fields borrowed the term to lay stress and emphasis on pupil thinking in construction.

In 1908, the Massachusetts State Board used the term "home project" to designate a pupil-planned practical enterprise carried out to completion at home, as for example, raising an acre of corn; and later the Federal Board for Vocational Education used it in reference to home projects in agriculture. The whole idea, however, remained quiescent until 1918, when the term again sprang into prominence and demanded widespread attention.

It is important to note that up to 1918 the prevailing conception of a project was a practical activity by which evident, concrete results were to be obtained by means of activity which involved the planning, devising, and carrying to completion of a practical problem.

In 1918, Kilpatrick's definition ventured a new note, a departure from the generally accepted conception. He said a project was "a unit of whole-hearted purposeful activity."

Personally, I do not like the word "purposeful." I believe that all human actions, good, bad, or indifferent, can be traced to some purpose.

Again, from this standpoint, the term seems to me to be almost identical with the doctrine of interest. Any class problem, be it a topic, drill, exercise, or application, becomes a project as soon as it is "whole-heartedly" motivated. By this definition how can we recognize an activity as a project unless we observe each individual to see whether he has maintained the "whole-heartedness" throughout the whole gamut of the procedure? The pupil who is wholeheartedly uninterested in the activity is not working on a project. Thus an activity might be a project today and cease to be one tomorrow for any particular individual.

From 1918 on the arguments raged back and forth. Printing presses were kept busy publishing volume after volume supporting or attacking the issue. In 1921, Charters launched a new definition. He said: "A project is a problematic act carried to completion in a natural setting." This was a step forward and put the emphasis on the pupil initiative in the procedure. The project had to emanate from the pupil. That was the natural setting.

McMurray objected to this strenuously and claimed that the term project has no concern with the natural setting, but has reference to the organization of the subject matter. He identifies project with "central teaching units," and says that these units should be organized to conform to every-day life situations which are not always practical. His purpose is to learn something, not to do something.

Thus we have the conflicting theories, which involves a confusion between motivation and curricula making. Is it any wonder that even teachers are confused? We are deluged with pamphlets, brochures, magazines and books, a large percentage of the contents of which consist of contradicatory theories advanced without due regard to scientific testing or experimentation.

Our primary interest is in mathematics and we are concerned as to whether the "project method" can help us in obtaining our objectives in mathematics teaching. Using Charter's definition as the one now generally accepted, I am of the opinion that it cannot help us because

1. I have never seen a project in mathematics sponsored by a pupil. A few tell me they have, but these occasions are few and far between. Without the natural setting there is no project. If the desire or purpose does not emanate from the pupil, then there is no project, but a splendid example of motivation. Then again, how many students will give rise to a project that will be a project to the other thirty-four?

   The life experience of the pupil is too limited and in my opinion the spontaneous, erratic and individual interests of children are not desirable substitutes for tested life experiences.

2. In high school at least, I believe, that the time and effort expended to marshall the necessary facts for any project of the pupil, may be out of proportion to the educational value of the objectives attained.

3. It breaks up the learning process, continuity and organization of subject matter. Unsystematic development tends to decrease the logical and clear conception of the subject matter treated and the values and attitudes accompanying the learning process of the same.

4. It is claimed that by organizing learning into projects, the school approximates life and the methods of life. I doubt this very much, because there is more routine in life than is usually considered. In this age of specialization all of us have routine work to do and a large part of the work of executives consists of routine manipulation. Skills are required in these activities. The project method gives no place for drill in manipulative technic or on essential skills and associations.

Scanned with CamScanner

For these reasons I believe that we in the mathematics classroom can do little with the project method.

However, Morrison's recent elaboration of McMurray's work on "central units" gives every promise of becoming a "real" idea, but should weather the test of extensive experimentation and testing before acknowledgement.

A PRELIMINARY REPORT ON AN EXPERIMENT IN REMEDIAL READING

REMEDIAL reading in the high school may seem unusual, but it is here to stay, if we are to justify our ways to the children we are supposed to be training for the present and the future. Certainly a program of remedial reading for comprehension will be necessary in the high school as long as the elementary school is forced to over-accelerate the progress of its pupils to make way for new hordes.

In our own school we have attempted to combine such work with the regular English program specified for Term II. At present our statistical data proving the measurable results of our work are not yet available, nor are we ready to do more than adumbrate our plans and devices. We have, however, already been able to gather a few salient facts in which we feel our colleagues will be interested.

Our original purpose was two-fold. First, we were not at all sure that we could give remedial work in reading without such special training and effort as might not be justified in the results. Secondly, we had no desire to displace any of the regular English work. Therefore, it was our job to find out if any or all of our teachers, without specialized training, could give corrective work in reading in the regular course of events, without special dispensations with regard to the rest of the English program.

The general outline of the experiment was simple. We were to test our chosen class with the Sigma form of the Haggerty Reading Test, Form B, at the same time testing another group which was to receive no special attention in reading. Then the teacher was to arrange the program for the class as best she could, preparing them for the same examinations the other classes in Term II were to take. During the term, the effect of the time taken out for the extra work on the class progress in English was to be checked crudely by the class standing in the uniform mid-term examination. The whole plan seemed simple and compact.

As nearly as I have been able to make it out, the underlying cause of the inability of our children to comprehend while they read springs from an over-acceleration in the elementary grades. Specifically, I have found among my own children a carelessness in looking at the letters of words, so that words somewhat similar were confused; a skipping of words and phrases in reading sentences, so that the meaning was distorted or lost; and a tendency to telescope sentences in paragraphs so that the meanings were hopelessly confused; all this, as well as the ubiquitous paucity of vocabulary.

To remedy the first defect, I have found it helpful to direct the attention of the student to a careful study of words. Checking lists of words in which identical pairs were mixed with pairs that differed slightly was a device helpful in establishing the habit of careful observation. Likewise, exercises involving the syllabication of unfamiliar words and drill in the use of the dictionary have lessened the tendency to telescope words. With this, I have found a slight improvement in spelling.

As for the students who skip words and phrases, I found it necessary to demand that they read for a time with a finger pointing to each word. After the habit of looking at words had become established, I asked them to read each sentence with a finger at the capital letter which began it and a finger placed at the period which ended it. When one sentence was thus read and the complete thought realized, I permitted them to go on to the next. This of course, served merely as a temporary device. After that, I let them read for practice paragraphs of informational material on which, subsequently, they had to answer questions. Incidentally, I found they had been learning to read the questions carefully as well as the material in the paragraph.

As for the vocabulary, I have found my little ones needed very little motivation for broadening their reading vocabulary. Lists of words taken from the various tests on reading and from the Inglis vocabulary test furnished my material. The children seemed to find it good fun to see how many words they knew and they seemed eager to see how quickly they could learn the meanings of words they did not know. The procedure ran somewhat like this. First a list was given out in which the words were used in sentences. Under the sentences were four meanings to choose from, thus:

The sky was *azure*.

Clear blue—gray and stormy—bright—flushed.

The children tried their hands at guessing the meanings. Then they were told the meanings. Thirdly, they chose the correct meaning for each word from the list of choices dictated. Fourthly, they wrote from memory the original word which corresponded to the dictated meanings, thus:

Clear blue—*azure*.

All the lists given were based on Thorndike's Word Book. I had to accept that as my final authority on the importance of the words in the children's vocabularies. I have also

Scanned with CamScanner

taken occasion during these periods devoted to word study to point out ways of breaking words into their component parts so that guessing at the meaning in a context would be not so much guessing as deducing. Approximately fifteen words could be so handled in one period.

I have found in my children an improvement in comprehension, but how much is due to my help and how much to the incentives offered by the standardized checks and progress charts I do not know. Such standardized material as I have had available has been invaluable in convincing the children of their deficiency and in inspiring them to improve. I have used the Thorndike-McCall reading tests for checking up, the McCall-Crabbe Test Lessons in Reading for practice with progress checking, and some paragraphs of my own for purposes of illustration. The Thorndike Tests of Word Knowledge have been helpful in isolating those having poor vocabularies from those merely careless in application.

I have found it further helpful to point out to the pupils the difference between the topic sentence of a paragraph and what we have called the "helping" sentences. It is sometimes useful, also, to point out the relation between the title of a selection and the topic sentences in it. As soon as we shall have conquered our lamentable tendency to grow absent-minded about the exact meanings of simple words, I hope to institute a very elementary type of outlining and note-taking to make apparent what a logical development of thought means.

My conclusions? I have had to conclude that proper spacing of matter on the printed page encourages careful reading about as much as anything else. Next in importance come the charts for checking progress. These engender something as near "the will to perfection" as I have seen among students. They foster a desire to outdo one's own previous record instead of somebody else's. All this seems to bring a concomitant honesty about mistakes that is encouraging.

To sum up, there is, first, the need to convince students that improvement is desirable; then comes the need to convince them that it is possible. With exercises and charts in their hands, and with a very little help, and a great deal of encouragement, they will do the rest.

RUTH E. SCHUCHOWSKY.

Morris High School.

MUSIC IN ITALY*

MUSIC in its expressive capacity transcends literature and other arts in revealing the innermost feeling and emotions of a people. If our task to teach the language and literature of a nation in our ultimate aim of gaining an insight into its inner character is to be made easier, we cannot omit from our program an attempt to gain a general appreciation of the music of that nation. I cannot conceive the possibility of a full understanding of a people's psychology without a fair appreciation of their music, the vehicle which leads us straight to their innermost feelings. This is especially true in the case of Italy because I know of no other nation that has done so much for the progress of music.

When we trace the development of music from its origin up to the Nineteenth Century, we cannot fail to see a very close parallel between Italian and world music. From the early efforts of the Greek and Roman musicians in Italy and then through the Middle Ages and modern times, Italy has been the greatest pioneer in every musical movement of importance. We may safely assert that every form of musical composition from the religious Gregorian Chant to the madrigal and later to the symphonic type was invented by the Italians. The greatest centers of world music, and sometimes the only ones, have been in Rome, in Venice, in Naples and in Milan.

Though the early periods of Greco-Roman and Mediaval music cannot properly be called Italian because of their lack of any defined national characteristics, whatever progress was made during these two eras must be attributed to Italy. For any culture developed within the peninsula, whatever its period, rightfully belongs to the Italian people, representing, as it does, their early heritage.

The only type of music prior to the Renaissance, to have any real importance, is the sacred Gregorian chant. The church during the Middle Ages was the only institution of stability, and as such, it was the only agency of progress, the only patron of every form of art. Music received serious attention because it was found of great help to the delivery of rituals which were felt to require, like the early Greek and Roman poetry, the help of a musical tone. As that early type of music was only used as the embodiment of poetry, the Gregorian chant, now written for the delivery of the sacred rituals, showed a desire to find a real tonal embodiment for the successful fusion of words and thought. Following, therefore, the religious spirit of the lithurgical works, music was stripped of all its pagan trappings. It remained without rhy-

—EDITOR.

Scanned with CamScanner

thm or any instrumental accompaniment. The former was not desired because of its sensuous character; nor the latter because of its association with pagan sensuality. Thus we have the spiritualization of music in its steady flow of pure melody which announces the works of Palestrina, Cherubini and later of Bellini, and the establishment of a tradition of melody which represents the main heritage of Italian music.

During this period leading to the early movement of the Renaissance which took place in Italy towards the beginning of the Thirteenth Century, there were important innovations which brought music closer to the people outside of the church. First we had the introduction of the hexachord system which represented the first form of solmization; and then musical notation and the four-line staff by Guido D'Arezzo, which gave us a definite idiom of music.

From the Thirteenth to the Sixteenth Century music remained in a period of transition during which it received a strong impetus with the increased desire of learning which pervaded the whole Renaissance movement. Music showed a marked tendency to step out of the narrow confines of the church into the hands of the masses whose crude but spontaneous creation kept it ever young and fresh. In secular hands, therefore, it was but natural that those very elements that the church had discouraged in her effort to keep music in its religious purity, compatible with the spirit of the church, should now form the basic motive of popular mus Rhythm, measured length of note part-singing, and instrumental accom paniment were introduced.

It is hard to estimate the importanc of the introduction of these new el ments in terms of musical progres For the first two are responsible fo what we call now "tempo"; the thir evolves into counter-point; and th fourth into instrumental polyphony as the desire for new effects grow Music now has the equipment nece sary to launch itself into its independ ent and glorious career.

The church, however, alive to th growing importance of music in the lives of the masses, in its pragmatic policy adopted it with all its new trap pings as a means of attraction for th alienated crowds which were now drawn out of the church by new and more interesting forms of diversion Yet its influence has been always sal tary in that it has kept music from ever falling into the hands of vulgar channels. We must add that the con stant struggle between the church and the profane element for the absolute possession of music has had the bene ficial effect of keeping music sailing a middle course both away from the sterilizing influence of the church and the vulgar channels of the masses.

It is now during the Sixteenth Cen tury that music achieves complete in dependence from the early supremacy of literature. In an age of experi mentation, of feverish activities in th search for new things, and new effects in art, music comes into its own and later forges ahead of literature, the reversing its position from the role of a hand-maid to that of a mistress. In this transformation music was helped by a new phenomenon which took place in the literature of Italy during that period. The beginning of the Sixteenth Century found Italian letters, after a glorious and golden era unparalled in the history of literature, in a period of transition. Its content being exhausted, it was now laboring under a perverted sense of art which sought originality and beauty in purely artificial and supernatural effects. Such a type of literature, devoid of sincerity of expression or real human content, was but an exercise in euphony, a series of melodic lines carrying no real message. It was but a step for music to enslave it and make use of it in its whimsical and tantalizing forms. Free from imitative patterns, music was just the art to offer unbound opportunities to those artists thirsty for spectacular and supernatural effects; for the opera later quenched that thirst with its pagentry and impressionistic form.

Although the Sixteenth Century cannot truly be considered a period of great musical progress, we are indebted to it for the first real pioneer work in music. As such, it is responsible for the development of both vocal and instrumental polyphony and counter-point; the introduction of harmonic structure and the "solo" work with all its harmonic implications which resulted in the popularization of music. For more tangible results, however, we are to wait until the next century.

The only two centers of music now existing in Europe are both in Italy: one in Rome, the other in Venice. These two centers represent the two opposing influences in the early history of musical progress; for Rome, identified with the Papal court, the Sistine Chapel, throws emphasis on ecclesiastic music without, however, entirely neglecting the secular type. Venice, on the other hand, not bound by religious traditions, stresses the secular type and its music is, therefore, more sensuous, more vivacious, and more impressionistic than that of Rome.

PIER LUIGI PALESTRINA (1526-1594)

Giovanni Pier Luigi, as a member of the Roman School, stands out as the greatest of all musicians of his time and one of the greatest of all times. He is the first composer to show the boundless possibilities of polyphony, which he brought to a state of perfection truly modern. This fact established him as the dictator of musical style, for his methods were then considered the acme of musical art. Even today, the Roman Church still accepts his beautiful style.

His music, aside from its technical progress, achieves startling effects without losing the religious sublimity required by the solemn text. His ideality of conception, together with the extreme sincerity of expression, marks his art as being truly classical, one whose beauty will never be tarnished by the evolutive process of time.

Within the Venetian school, however, not bound with the demands

Scanned with CamScanner

and limitations of the church, there was a strong desire for innovations and a search for sensational effects, especially in the secular type of music. It is this tendency that is responsible for much progress and many inventions of musical forms, such as the "villanella," the "frottola" and the most important of all, the madrigal.

I said the most important of all because the invention of the madrigal marks a turning point towards the general advancement of music and its ultimate emancipation from the literary text. As a part-song it represents a new development of counter-pointal music; as a popular melodic outburst, it is directly responsible for other forms of vocal music, including dramatic monodies and arias, thus revealing the possibilities of melody where the Italians have been and still are the leaders. Its influence throughout Europe was very great, for it gave a strong impetus to secular music, raising it to artistic dignity, and thus opening new fields outside of the narrow confines of the Church.

Indirectly, the madrigal is also responsible for the invention of the opera. Alive to its dramatic possibilities, a group of "dilettanti litterati," led by Giovanni Bardi of Florence, in an effort to bring Italian drama back to the pristine form of the ancient Greek drama, conducted a series of experiments in dramatic expression using some kind of musical declamation which resulted in the invention of the "morodies" and later in the first presentation of the opera.

Properly speaking, however, the origin of the opera and the oratorio may be traced back to the dramatic practices of the Middle Ages instituted and sustained by the Church. The Mass, the re-enactment of the life of Christ, the mysteries, the miracle plays, were all designed to give instructions and edification to the ignorant masses. These religious activities, however, always tending to pass into secular diversions, were the precursors of the drama in the various vernaculars. The idea of the opera and the ortatorio began when it was perceived that the vehicle of impression might be musical throughout and when appropriate musical styles were devised. The invention of the monodies, representing, as it does, the first attempt to combine dramatic with musical expression led, therefore, to the presentation of the first opera "Dafne" and later to the first oratorio.

Claude Monteverdi (1561-1643)

And yet it was only with the advent of Monteverdi of Venice, one of the greatest formative genius of musical history, that the opera as an important musical form was firmly established. As the author of many operas, he is responsible for the introduction of recitative, sustained melodies, polyphonic instrumental music, and solos. With all these new elements the success of the opera was so great that it led to the establishment of many Opera Houses in many Italian cities and later throughout Europe.

The great work of Monteverdi was continued by two other important composers. Both of them introduced

important innovations. Francesco Cavalli introduced the "aria" in the opera, thus giving lyrical expression to its characters; Marc' Antonio Cesti, the comic element. Later Cavalli transferred to it the elements of the "cantata," which gave power to the social element towards its vocalization possibilities, which had first been introduced into the oratorio by Carissimi.

With this, the opera was brought to the first mile-stone of progress, and music in general was advanced to the role of an important and independent art of limitless possibilities; for the opera, on account of its manifold character, has been determinative of all musical progress. Advancement took place in all the branches of melody with all their vocal implications, such as the "arias," the solos, and the consequent school of singing known as the "Bel Canto," which reached the height of all possible development in that century, constituting, as it does, one of the major glories of Italian music. Also orchestral music and the necessary instrumental developments which resulted in the evolution of the violin, the piano and other instruments, were brought to a high state of perfection, preparing thus the way for pure instrumental music, which formed the basis of symphonic compositions and which later, at the hands of the German masters, reached a high state of artistic development.

The Italians, however, have ever excelled in the melodic type of music. For the Italians, endowed with an eminently artistic temperament, quickly respond to exterior or internal stimuli which cause within them an inner reaction, dynamic in character, which demands outlet. In the process of exteriorization, his feelings take the shape of clear images which present all his inner feelings without any restraint, in a simple but forceful manner. Hence his predilection for vocal and melodic music which expresses more distinctly his inner life.

In this style of music the Italian has shown great geniality; for melody represents both the idea, which is pure content, and the invention, which acquires great imagination. Harmony and orchestration, however important they may be, play only auxiliary roles, for they only serve to dress the form and give color to the idea.

Corollary to their ability for melodic inventions, the Italians have excelled in the field of vocal culture. No method, as yet, other than the traditional Italian of simple, free, spontaneous, pure vocal emission, has enjoyed any success of note. And here again, they have been helped by the character of their language. Free from any guttural, throaty sounds, possessing clear and open-throated vowels, it lends itself to the most exacting demands of vocal virtuosity. I know of no other language which would prove adequate in the virtuoso, warbling passages of a Rossinian opera. No language other than the Italian could give that liquid, uninterrupted flow required in that school of operatic composition.

Scanned with CamScanner

Allesandro Scarlatti (1659-1725)

At this point, the center of musical prominence has shifted from Venice to Naples. The latter city, as the capital of a new kingdom, began to attract many great minds of Italy and of Europe, becoming thus an intellectual and artistic center. Among the many intellectual leaders gathered at Naples there was Alessandro Scarlatti. With him the era of Neapolitan opera began; for Scarlatti was the most forceful musical genius of that time and his influence was felt even beyond the boundaries of Italy.

This master is another luminary in the history of music. He is noted not only for the purely technical contributions to polyphony which he brought to a high degree of perfection, becoming a great pioneer in instrumental music, but also as a great teacher, a stimulator of geniuses who, attracted by his wide renown, flocked to him from all parts of Europe.

Scarlatti is the father of that classical style of the Seventeenth Century which has been an inexhaustible source of musical inspiration. We laymen still return to the soothing strains of his songs which communicate to us a feeling of sad repose and resignation. It is no small wonder, therefore, that Neapolitan music under his inspiring guidance remained the arbiter of musical taste in all Europe and determined largely the progress of German and, later, French music.

As a by-product of the opera we have the Opera Buffa. Starting as an "intermezzo," a short musical composition with a slight farcical plot and some personages introduced between the acts of an opera to hold the interest of the spectators during the long intermission necessary for the preparation of the scenery for the following act, it was developed into an independent musical genre.

Giovanni Pergolesi (1716-1736)

Pergolesi was the father of this new type of operatic composition. His works show that comic and sparkling vivacity and brilliancy of effects which prepare the way for the later Romantic type of opera made famous by Rossini.

Having its origin at Naples, the gayest Italian city, the success of the Opera Buffa was immediate. For there were even times when it seemed to find greater favor with the public than the more serious type. It is this very type of composition which, brought into France by troupes of ragged musicians, established there a national type of music, "L'Opéra Comique," which represents one of the glories of France.

The Oratorio

As a means of drawing the people back into the Catholic fold, the Church devised some sort of religious musical drama to match the progress of secular music in the opera. Following, therefore, a dramatic plan, an idea borrowed from the opera, the first oratorio sponsored by St. Filippo Neri was presented. Keeping abreast with other forms of musical progress the oratorio was gradually evolved into a real artistic type of music. Giacomo Carissimi later introduced into it the chorus work, and the cantata, which was a form of recitative and aria followed by a dramatic plan for one or two voices. The Italians, however, displayed but a slight interest in its later development, although the number of their works is not small. In all the forms of religious music, following the early pioneer work, the Italians in general have shown a decided lack of interest. Their religious music, therefore, has seldom risen to the height of permanent value because it has lacked the religious fervor of the protestant north and has had no depth of homely piety, all restraining influences of sacred writing. Still, towards the beginning of the Nineteenth century, Luigi Cherubini, a truly shining light, brought Italian religious music back to a dignified nobility of expression which contrasted sharply with the tawdriness of the operatic music of that time. Towards the end of the last century there seems to be a revival of religious music as exemplified by the serious work of the contemporary Perosi and many others.

Pure Music

The development of the voice as a solo instrument, which brought about the true and intimate personality of the performer, gave rise to various efforts to match its possibilities with other instruments. Thus, out of the great variety used since the early periods, those instruments which approached the voice in their tonal effects were further developed. The viol family, the flute, the trumpet and the oboe, chosen because of their remarkable similarity to the human voice, received serious attention. This early experimentation, thanks to the work of Tartini, both as a theorist and a technician, of Viotti and later of Paganini, gave birth to a school of violin music and violin virtuosity which not only equalled the progress of the voice, but also surpassed its technical possibilities and established itself as an important and independent branch of concert music.

With the development of polyphony the organ, the first representative of the key-board instruments, drew the attention of many musicians. In imitation of it many key-board instruments were evolved. These early experiments later culminated with the invention of the pianoforte by Bartolomeo Cristofori.

It was but natural that these new instruments, offering possibilities hitherto unrealized, coupled with the improved taste of the public, which was now beginning to accept solo and concert work as important music, should lead many enterprising composers to explore the virgin field of chamber music. Their experiments resulted in the creation of pure music, with forms of its own, more or less independent of any literary text. Many were the forms of composition thus invented. Their variety was largely determined by the varied needs of different instruments or groups of instruments. The Suite, a series of

Scanned with CamScanner

dance tunes related to one another, was written for a small orchestra; the Fugue, a type of contrapuntal composition, for the organ; the Overture, a part of a dramatic composition, for a large orchestra; the Sonata, a chamber work, solely for solio instruments; and the Concerto was composed as a solo work with orchestral accompaniment.

Here again we have the name of another Scarlatti who is also famous in this new work. Domenico, worthy son of a great father, was a great pioneer in the field of pure music. He is noted for his contributions in emancipating the key-board composition from the trammels of counterpoint and in advancing free style which was modern in its harmonic views.

It is in this field that the Italians now began to receive strong competition from the Germans who, with the work of Handel, were laying the foundation for a glorious era of Germanic music; and later, with the masterpieces of Haydn, Gluck, Mozart and Beethoven, they eclipsed temporarily the greatness of the early and contemporary Italians.

Still, this rising school of German musicians was not immune from the strong influence of the early Italian masters during its formative period. Haydn studied at Vienna with Metastasio and Porpora, whom he served as a valet in exchange for musical lessons. Gluck, the reformer, was also a student in Italy. Mozart, the genial and unsurpassable melodist, seems to have inherited all the melodic tradition of the Italians. They all wrote music in Italian. And even the great Beethoven suffered greatly the influence of Muzio Clementi, who had previously established a pianistic school whose style is remarkable for its singing and vigorous tone.

The Romantic Era and Givachino Rossini (1792-1868)

The birth of the Nineteenth Century brought with it a new artistic and literary movement which had great influence in changing the social and artistic life of all Europe. Romanticism, which showed a desire for individual expression untrammeled by the neo-classic doctrines of the previous periods, found also expression in the field of music. The librettos of the Romantic Opera, therefore, do not present any longer characters dressed as shepherds of a new Arcadia, but palpitating lovers who are ready to die for their beloved ones.

The greatest exponent of this type of opera is Rossini, one of the most sensational composers of all ages. The whole operatic world was stirred about the advent of this musician, the most forceful genius since A. Scarlatti. His rapid ascent to fame and his influence throughout Europe was simply astonishing. By sheer vitality, witty vivacity, and remarkable versatility, he won the homage and respect of his public. The opera, which had already shown signs of decadence, with him took a new lease of life, for he injected new vitality into it. His music is spontaneous, highly imaginative and extremely cor-

orful. He pours into it all of his happiness, his zest for life, and we feel upon hearing one of his melodies the same cheerfulness, the same joy of living. In the "Overture of William Tell" nature smiles and life revives in happiness and joy. In the "Barber of Seville" his melody flows liquid and sparkling like a fresh and rippling brook on its happy journey. In his orchestration he shows himself not only a highly imaginative writer, but also a master of technical effects.

This romantic and florid style of composition found many followers. Donizetti and Bellini wrote many operas which won international renown. Though influenced by the music of the great genius, both showed originality of treatment. Bellini, the more resourceful of the two, is remarkable for his purity of style, which achieves a sublimity truly sacred, and his music inspires a religious awe in our hearts, bringing to our agitated souls a sense of repose. Chopin found in Bellini his own master, and in his style, an outlet for his turbulent emotions, and peace for his troubled existence.

Giuseppe Verdi (1813-1901)

Italian music, especially the opera, following the Rossinian era, must be judged in the light of certain political events which constituted elements of inspiration for the important musicians of the period, thus determining the character of their art. The dream of many centuries, the unification and independence of Italy, was about to come true. Every social, literary and artistic effort of the nation, therefore, was pointing towards this sacred goal. As in literature, the historical novel was a potent weapon in awakening the desire of the masses for political independence, in music the historical opera was in the same degree successful in crystallizing that desire. Other forms of musical compositions were temporarily neglected; yet musical progress in other fields was not stayed; for the opera, owing to its manifold character, is all inclusive and well takes care of every form of music.

The giant of this age is Verdi. He is the foremost composer and the man of the hour. Italian to the core, he always sought in his operas an opportunity to help his country. All his librettos were based on subjects which either recalled the military prowess of ancient times or pointed out the terrible political slavery into which his people had fallen. As a patriot and as a musician, he won the hearts of his country-men.

Slightly affected, at first, by the Rossinian school, he later worked out an original type of opera, all his own. Always a student till his dying days, and always susceptible to suggestions from all sources, he gradually brought Italian opera from a crude musical form to a most elaborate type, one to compete successfully with the best of Wagner's.

He is the greatest melodist of all times. His operas have kept within the sphere of the best Italian tradition, showing spontaneous geniality and complete mastery of harmonic

Scanned with CamScanner

structure and orchestral effects. In that, Verdi represents the examplification of a happily wedded type: the genius and the master. "Aida," one of his later types of opera, leaves little to be desired either in its inspiration or in its masterly treatment both of harmony and orchestration.

While satisfying the critics of "Bel Canto," owing to his mastery of the human voice, his operas never degenerated into vehicles of vocal virtuosity, for he never lost sight of dramatic truth and power. His best works show sincerity of expression and unadulterated pathos. Any one who has seen either "Traviata" or "Othello," or any other opera for that matter, cannot fail to be impressed by the force of the dynamic emotional powers of their characters. Pity or fear is deeply stirred in our own hearts by the forceful and true music which touches our emotional chords; and while it injects into them a note of sadness, it leaves us satisfied with its beauty.

AMILCARE PONCHIELLI (died 1883)

Ponchielli properly belongs to that group of Italian composers who were both influenced and obscured by Verdi. Yet he is deserving of special mention because with him modern Italian composition begins. His operas, while not showing the spark of a great genius, are important on account of the masterly and more modern treatment of harmony and orchestration. "La Giocanda," his most important opera, would have been a matchless masterpiece, were it not for the absurdity of its libretto and a predilection of the composer for a bombastic flamboyant musical style. However, he won lasting fame more as a teacher and a developer of great geniuses than a composer, for Puccini, Leoncavallo and Mascagni were all his pupils.

While the musical school that follows this period shows unmistakable signs of Wagnerian influence in its orchestral treatment, Italian operatic music has never lost originality and has always followed the melodic tradition of its best era. The composers who have remained faithful to the Italian character have as a rule been rewarded with lasting success both in Italy and abroad. Those who have shown, together with all the harmonic and orchestral exigencies, a melodic inspiration have been quickly recognized.

Puccini's music has enjoyed a great popularity all over the world, especially in America, because of his ability to choose subjects of universal appeal, and because the composer, through the medium of his dramatic characters, has struck the universal chord of human sympathy. "La Bohème," his best opera, will have many a successful night in our opera houses, probably for years to come, because its characters are not citizens of any particular country; they are artists, citizens of the world. Its music, which truthfully embodies the diverse moods of the main characters, though languid, has always the power of evoking those deep and eternal passions of mankind which have stirred and always will stir the heart of man.

Pietro Mascagni won instant fame with his phenomenal "Cavalleria Rusticana," an opera which keeps the audience gasping and breathless with its ever rising action and its fiery and stirring music until the final and tragic climax. Leoncavallo won fame with "I Pagliacci" and other operas. These two composers have been influenced by a new trend of Italian literature. They followed the school of verism as exemplified by G. Verga in his treatment of Sicilian life. "I Pagliacci" and "Cavalleria Rusticana" are both based on veristic plots. They both have as a background the rustic life of Southern Italy at its worst, portraying the turbulent passions of its people which in contrast with their rigid and uncompromising and exalted sense of honor must ultimately and inevitably lead to a tragic *dénouement*.

Of interest also is the fact that there has been a marked tendency to return to the field of symphonic and religious compositions. Let us hope, therefore, that the young musicians of today who have already shown signs of a restless spirit will continue to give to Italy that place in music which she should occupy by nature of her glorious past.

RECOMMENDATIONS CONCERNING THE IMPROVEMENT OF SANITATION IN THE HIGH SCHOOLS

THE Sanitation Committee was appointed by the High School Teachers' Association and the New York Association of Biology Teachers to make a survey of conditions of sanitation in the high schools with a view toward making recommendations for improvement.

The committee first studied a similar investigation and report made in 1918. It was of interest to note that a great many suggestions made at that time have been included in the high schools built since then. The city seems to be trying to do its best to improve the physical conditions of our schools. The too rapid increase in high school population has been responsible for the taking over of annexes in buildings not suited for secondary school work. It is in these buildings that most of the objectionable conditions exist. It is hoped some satisfactory solution will be found for the situation in these annexes.

The following suggestions based on answers to a questionnaire sent to all

Scanned with CamScanner

of the high schools are offered by the committee with the hope that sanitation in the high schools may be still further improved.

The Committee in charge:

A. Recommendations Concerning the Selection of Sites to Improve Sanitation.

1. Most of the newer buildings have sufficient space for recreational activities. The older buildings and most annexes indicate a lack of space. Schools built in the midst of business or crowded residential sections seem to be the sufferers. It is recommended that as far as possible, locations be chosen for schools where adequate playground space can be supplied. In schools with insufficient space, it is suggested that wherever it is possible, the roof is modified to accommodate pupils. Where playgrounds are provided, it is recommended that the principals of the schools make certain the space is utilized not so much for team practice as for general outdoor health education.

2. Approximately four schools report extraordinary noise, annoying smoke, and lack of sunlight. In each case it is a building situated in a business section of the city. It seems desirable to place school buildings away from lines of traffic and annoying neighbors, such as garages, car-barns, factories, and junkshops. Careful police supervision is suggested to see that anti-noise restrictions are observed.

3. Inasmuch as many of the high schools report buildings too tall for comfortable travelling, it would be wise to plan that future buildings be no taller than three floors.

4. Several of our present high schools and their annexes report their buildings are so situated that a maximum of sunlight cannot enter the rooms because they are constantly shadowed by tall buildings. Since sunlight is essential for the physical welfare of both pupils and faculty, we recommend that school sites be of sufficient proportions to assure no close neighbors.

5. A location chosen for a high school building should, in our estimation, be far enough away from pools or ponds of stagnant water to be free from mosquitoes. Breeding places for flies in adjacent garbage, stables, or accumulated litter should be cleared away.

B. Recommendations Concerning the Relation of Building Equipment to Sanitation.

1. It appears that the Building Bureau maintains certain standards regarding the color of the walls and of the furniture. This consists of the following: Class rooms, halls and assembly rooms are to be painted ivory color with furniture stained in light or dark oak. Recreation and rest rooms are furnished and painted as directed by a school committee appointed by the principal. It is recommended that the Building Bureau appoint committees to study new institutions such as the Medical Center with a view toward making the color of walls and furniture in schools more attractive.

2. It is recommended that floors of the classrooms and especially of the gymnasiums in new buildings be laid in hardwood and properly dressed so as to prevent splintering.

3. New buildings ought to be provided with adequate stairways to meet any emergency.

4. It is indicated in the report that certain drinking fountains do not work properly. It is suggested that plumbing of certain schools be altered to give pupils an adequate supply of sanitary drinking fountains that work properly.

5. In most industrial organizations of a higher order, adequate facilities are now provided for the rest, recreation, and for the medical aid of their employees. Some of our schools are slightly behind in this matter. Better facilities ought to be furnished in the interest of school efficiency and economy. The committee recommends that every school, without rest rooms for teachers, at present, should set aside some space where teachers may spend their free periods and work at their leisure. The committee further recommends that all new schools should provide rooms for the exclusive use of teachers.

6. The survey shows that certain schools need elevator equipment. It has been advocated that children who have cardiac or pulmonary conditions, and those who are crippled or who have had surgical treatment, should not be compelled to climb stairs to get to their classes. This type of exertion is detrimental to the health and life of such children. A thorough investigation ought to be made of these schools and a definite plan should be presented for the relief of these schools. All new schools above one story high should include elevators as part of the building equipment.

7. It appears to the committee that each pupils ought to have a place, for which he or she is held responsible, where clothing, accessories, books and materials necessary to school work may be kept safely. It is recommended that provision be made, especially in new buildings, for an individual locker for each boy or girl. It is further rec-

Scanned with CamScanner

ommended that these lockers be cleaned at regular intervals and be given special cleaning when occupied by a pupil with a contagious skin disease.

C. Recommendations Concerning the Methods of Cleaning to Improve Sanitation.

1. It is recommended:
   a. That no cleaning be done while classes are in session.
   b. It is further urged that schools should be equipped with vacuum cleaners.
2. That feather dusters be taken off the supply list and that instead of these antiquated relics, cheesecloth and other modern dusters be provided.
3. That a better grade of chalk be furnished by the city. Dustless chalk can be secured. One teacher has bought all the chalk that has come into her room for two years rather than suffer the annoyance of the chalk that is procurable in the supply room.
4. That in every school erasers be really cleaned by the cleaning force.
5. That desks and clothing closets be dusted daily with cheese cloth. Thorough washing should be done during vacations.

D. Recommendations Concerning Toilet Facilities to Improve Sanitation.

1. Certain schools report inadequate toilet facilities. We can readily understand how an annex located in a very old elementary school building would not have sufficient accommodations for pupils of high school age, but adequate changes should be made to correct this difficulty. We recommend that such conditions be brought to the attention of the superintendent of buildings with a view toward making necessary changes so that these schools conform to the modern sanitary standards.
2. It is recommended that paper towels be furnished by the city for the following reasons:
   a. It is incongruous to teach hygiene and not to provide for the washing and drying of hands.
   b. Vending machines are inadequate for
      (1) Many pupils either lack the pennies or do not use them.
      (2) These machines are constantly getting out of order so that they can not be relied upon.
      (3) These machines encourage theft.

   c. At present toilet paper is being used in large quantities for drying hands, with the result that the toilet paper is wasted and the hands are not thoroughly dried. With this arrangement money is being lost.
3. It is recommended.
   a. That a soap-dispensing system be provided in the original specifications of the building to feed all lavatories and showers from an overhead reservoir.
   b. That toilets, wash basins, and lavatory floors be washed with a solution of salsoda or some antiseptic.
   c. That drinking cup machines be installed in every lavatory.
   d. That all girls' and women's lavatories be provided with vending machines for sanitary equipment. Since this entails a fee for the pupil or the teacher, it should be cared for in the school, possibly by the health officer (if a woman).
4. There should be generous provisions made for adequate toilet and sink facilities in lavatories adjacent to lunchrooms.

E. Recommendations Concerning Lunch Rooms to Improve Sanitation.

1. The organization of the lunch room, so often left to some "practical" member of the faculty, should be in the hands of a small committee of teachers, the chairman being a trained dietitian employed by the school to supervise not only the food served, but the circumstances in which it is handled and eaten. The chairman of the Health Education Departments and of the Department of Biology should be represented on the committee.
2. It is apparent that utterly unsuitable lunch room conditions are found in many of the older buildings now employed as annexes. The committee feels strongly that it is the duty of the Board of Education to improve these buildings as soon as possible. Certainly, rooms used for physical training classes should not be used for lunch rooms.

F. Recommendations Concerning the Relation of the Use of the Gymnasium to Sanitation.

1. It is obvious that every secondary school pupil should have a swimming pool at his disposal; but the lack cannot easily be remedied in the older buildings.

Scanned with CamScanner

2. It is recommended that the water be changed at least twice a week. It is further recommended that antiseptic foot tanks be a part of the equipment of all swimming pools.

3. It is the opinion of the committee that instruction in the use of the showers should be provided in an attempt to inculcate their habitual use and that careful supervision be instituted to see that pupils use the showers properly. Only one school in thirty-five reported the existence of such instruction; it may, however, be more common in those schools not using the showers; it is recommended that they use them after physical training periods in case there is no pool in the school. It is further recommended that more shower baths be built in new schools to give every child a chance to take a shower after the physical training period.

G. Recommendations Concerning the Relation of the Proper Care of Pupils' Health in School to Sanitation.

1. There is so close a connection between health and efficient school work, that an annual complete physical and dental examination should be required of all boys and girls. As far as possible this should be done by a competent family physician and dentist.

2. The physical examination should be carefully followed up with a view toward removing remediable defects and bringing the health of the pupils up to the finest possible standard. In some schools, the physical examination records are filed away and very little use is made of them. The high school diploma should be enlarged to include "good health" as well as good scholarship and good character. Modern education should be interpreted to include instruction that will help the high school graduate understand preventable disease so that the employer will have a reasonable assurance, in the high school diploma, that his employee will not miss time from business because of preventable illness. It is the feeling of the committee that this can be done largely through the present organization of the health education teachers if they can be educated up to the importance of health and if they spend their best efforts on health building rather than competitive athletics and team development. In addition to the removal of defects, hygiene instruction should be given to groups in ordinary classrooms, in order to set standards for health habits. The important thing in hygiene instruction is to select teachers who have the following qualifications: interest in health problems and in children's

scientific training so that their standards and information are correct; correct classroom methods so that emphasis is placed on individual problems and on pupil activity rather than on the lecture methods frequently used in mass instruction; a desire to spend time outside the classroom in discussing individual problems with the pupils.

3. Each school building should have a properly equipped room to which pupils who are ill during school hours can be sent. The committee does not wish to encourage too much first aid or paternalism on the part of the school, but it feels the necessity of such a room for emergency treatments. In so many homes both parents go to business, and it is not always practical to send ill pupils home.

4. There are so many accidents possible in gymnastic work, biology, physics, chemistry, domestic science, workshops, and other laboratories, that it seems desirable to have first aid equipment availbale in all laboratories.

5. Overcrowding seems to be a problem in many high schools. The committee feels unable to make any practical suggestions in regard to this condition. The high schools are now feeling the results of the extension of the compulsory school age to seventeen years, and of the general business depression. We believe that the High School Division of the Board of Education has this condition under advisement and that some solution will be forthcoming.

6. That each high school should have a health council headed by a health officer to advise, take charge of, and supervise problems of sanitation. This organization should exist in annexes as well as in main buildings. The health council might consist of the health officer designated by the principal, the custodian, representatives of biology, health education, and home economics departments, and any other competent and interested people. Problems concerning cleanliness, heating, ventilation, illness, lavatories, the lunch room, and any other problems can be taken care of satisfactorily by such a council because all viewpoints should be represented.

H. Recommendations Concerning the Education of Pupils to Secure Pupils' Participation in the Sanitation of the Building.

1. The committee feels that the care of the building rests primarily with the pupils rather than with the teachers, the custodian, or the custodian's helpers. No amount of supervision of lavatories or cleaning of the

Scanned with CamScanner

school will be effective unless adequate education is given pupils in the care of the building, in prevention of litter accumulation, in defacement of walls and furniture, and in care of lavatories and drinking fountains. High school education fails unless it teaches proper respect for property. The best place for planning this campaign is the hygiene classroom. If hygiene is distributed throughout the entire high school career, the control of habits of sanitation is extended throughout the entire school career. It is most advisable, however, to give such instruction to regular recitation size groups instead of to large groups so that a more direct appeal may be made to the individual pupils and so that the individual pupils may present definite cases for class consideration. Where this instruction is given to large groups, very little individual response can be secured. There should be a concerted effort on the part of all school agencies to see that the pupils participate actively in the care of the building. All teachers, all classes, all pupils should be actively alert to the care of the building at all times.

2. It seems advisable to have morning inspection of all pupils in official rooms so that suspicious coughs, skin conditions or any other disease condition can be controlled. While the hygiene and health education teachers are the specialists along these lines, many contagious cases escape notice until they have been circulated in school for some time. If, in the morning inspection, the official teacher notes a suspicious condition in a pupil, that pupil should be sent to the health officer for investigation. It seems to the committee that a better control of habits of cleanliness and personal appearance could be effected if the aid of official teachers could be enlisted. Swimming teachers should conduct painstaking examinations before each swimming period to detect conditions of uncleanliness or infectious conditions such as colds, sinus infections, ringworm, scabbies, impetigo, and planters' wart. These cases should be referred to the health officer for follow up work.

3. A concerted effort should be made along the lines of accident prevention. Official teachers, assembly programs, hygiene classes, health education classes and all possible means should be utilized to reduce the number of accidents to school children both in and out of the building.

The Committee in Charge

HIGH POINTS

"Let's Write a Book"—A Project in Creative Writing

The first day of school this term, my second term students were engaged in an enthusiastic discussion of "Books you can't afford to miss." Suddenly, one of the children exclaimed: "Why can't *we* write a book one can't afford to miss?" The suggestion was instantly seconded by the class, and in this way our composition project saw its inception.

Taking advantage of the interest of the class, I spent a few periods doing "laboratory work" with them. This consisted of having the children bring to class, for discussion and analysis, their own books, as well as library books. Not only were the contents of the books considered, but all of the mechanical features were carefully discussed. One fortunate result of this first part of our enterprise was the general increase of reading in the class.

The next step in our task was to choose appropriate subjects. Many, indeed, were the titles suggested, and in the end we had a wide assortment to choose from: "Adventures," "My Hobbies," "Chinese Stories," "Jolly Times," "Museums," "Sports," and "Mystery Stories," were a few of the suggested titles. Of course, the students of ability chose more individual topics. One girl proposed to write on "The Three B's of Music," while others, writing original stories, created fitting titles for their tales.

The next three weeks proved busy and happy ones for the children. We had decided that our books should contain a minimum of three chapters. Many students, however, wrote five or six. This, of course, entailed considerable work. Students, moreover, were required to re-write their compositions, and they did this most painstakingly, for they were genuinely interested in correcting their errors in order to produce a "perfect" book.

The actual composition work completed, the class now eagerly made a search for illustrative materials. The less gifted students merely cut out

Scanned with CamScanner

pictures from newspapers and old magazines, but the more gifted displayed fine ability in creating original illustrations. Cover designs and bookmarks were also considered at this point with equally happy results.

Attention was next directed, once again, to the other mechanical features of a book. The title page, the table of contents, the dedication, and so on, were all considered. Some of the dedications the children wrote were very charming. One little girl wrote an original poem in which she dedicated her book of "Adventures" to her dear mother.

Since many of the students at John Adams are skillful in using the typewriter, I thought it would be helpful to correlate our work with that of the typewriting classes. As a result, most of our books were beautifully typewritten.

When our task was completed, the children brought their finished books to class and read them to each other. Afterwards, the books were hung around the room to serve as original wall decorations.

That this task proved stimulating to the students is evident, not only from the interest taken during the conduct of the work, but also from the eagerness with which the children have plunged into another composition project—the writing of a newspaper. That my students have gained in composition ability is shown by the decided decrease in their work of errors which usually appear in the papers of high school freshmen.

In conclusion, I should like to append a few outlines of the books which will serve to indicate the wide range of interests tapped in our project.

A School Makes Its Movies

As its parting gift to the Far Rockaway High School, the Senior Class of June, 1932, donated a motion picture camera and projector. The machine was first used to obtain living portraits of members of the faculty arriving one morning at school.

From this entertaining feature, it progressed to shots of students in action: the commencement procession, tennis matches, the riding and archery clubs, the baseball and punchball teams, and a major opus of the football team in practice and in actual play. In fact, the latter flashes reveal exciting end-runs, forward passes, and even a touch-down. The dancing classes have not been neglected, for there is a reel of a picturesque minuet, a souvenir of the Washington Bi-Centennial Assembly.

Let us consider the adaptation of these films to educational needs. Surely there is no more efficacious method of teaching skills that require definite movements than illustrating them in close-up flashes of students adept in different types of sport. By showing these pictures in slow motion, we can achieve the last word in visual representation. In fact, it is hoped that the films will become an aid to our Health Education course and will be included as part of the regular instruction. Perhaps the most vital history lesson ever given in the school took place recently after three o'clock, when eager students thronged the auditoriums to witness a film of scenes from the World War. They were excellent pictures and the comments after the performance proved that the futility of huge armaments was far better disclosed by the screen than by classroom talks.

To limit the value of the machine to the purely educational factors tells but half the story. At present, because of the intrinsic value of the machines and the inexperience of pupils in this field, students act only as assistants. The actual filming is done by a member of the faculty who is familiar with the intricacies of photography. Thus far, the only expenses incurred in the use of the camera have been for the purchase and developing of films. The enterprise, financed by the General Organization, is a worth-while outlet for profits accruing from gate receipts.

The projector is a sixteen millimeter outfit and can show films on any size screen. Hence pictures borrowed from film libraries may be displayed in the school Auditorium. Students may enjoy the better type of cinema entertainment which they themselves frequently overlook in their response to the more lurid pictures shown in average theatres.

There is here a good opportunity to arouse in students a love of good literature, the chance to see literary pieces transferred to the screen. By providing such entertainment the school becomes not only a place for study, which by its very name implies something distasteful to youth, but it also becomes a place to work in, to play in, to live in; this after all, is what a school should be if it is to have a vital effect in shaping the lives of youngsters.

The last, but by no means the least, of the advantages of the camera, is its contribution to the tradition of the school. History is made every day. Every record broken, every game won, every event celebrated in

Scanned with CamScanner

the school is indelibly recorded. In years to come, this picture library will add the glamor of past history to the tradition of the school. Nothing is more encouraging in the life of a pupil than to look back upon past accomplishments, compare them with the present, and note the progress that has been made. This is one of the aims in enlarging our motion picture library.

Far Rockaway feels confident that its new "film industry" is a worthwhile addition to an ever-lengthening curriculum.

JOSEPH E. JOHNSTON.
RUTH T. GOLDSTEIN.

Far Rockaway High School.

The Pipe Organ in Theodore Roosevelt High School

When the Board of Education of New York had the fine Estey pipe-organ, a modern electric action organ, installed in Theodore Roosevelt High School, William R. Hayward, Principal of the school, members of the Music Department, and all concerned were determined that the organ should become an integral part of the school life and should not be heard only on Occasions! Mary Caecilia Doran, accomplished organist and enthusiastic teacher, most heartily agreed with this determination and instituted a series of daily recitals and found other ways to intrench the instrument firmly in the life of the school. Now that results of her work of a year and a half begin to be very tangible, the inside story may be told.

The organ is not a sideline with Miss Doran, but an art. She can have part a real enthusiasm for it because it is one of her major enthusiasms she can give instruction because she comes to the work with thoroughly adequate training. Miss Doran is a graduate of the Yale School of Music. She studied composition with Horatio Parker and David Stanley Smith. Harry Benjamin Jepson was her teacher in organ and for twelve years she was church organist and director in a large church in New Haven. So much good teaching is known to be mere contagion that in this case one is tempted to credit Miss Doran's success mainly to her complete absorption in the organ and to her knowledge of and love for it.

Very soon after the installation of the organ, Organ Appreciation classes were established. There was one last term; there are two this term, one more advanced than the other. Each class meets once a week and each passing pupils receives a .5 major credit. Eighteen pupils are enrolled in the elementary course and twelve in the other one. More boys than girls are enrolled; no one knows just why; perhaps the answer is mechanics, perhaps music. None of these students plays an organ, but they are out to learn all they can about the instrument so complicated in its structure and so majestic in its appeal. One boy grew so absorbed in the study that he asked if it would not be possible for him to learn to play *some* instrument while in school. Accordingly Miss Doran found that he could be taught the

oboe in connection with the school orchestra. Another member of the first class, who is now graduated, reported just recently that she is now a professional musician since she is receiving a salary as organist and choir director in a church. She volunteered the further information that she intends to spend all the salary on lessons in organ playing.

Excursions have formed a large part of the activities of these classes. They have visited organ factories to learn about the various types of pipes and how organs are built. The classroom, or organ office if you wish, has an interesting display of pipes which are the tangible mementos of these trips. The organ rooms at Roosevelt have been made to yield their mysteries to these young enthusiasts. There have been visits to theaters where the devices of the theater organs have been explained to them. Church organs and pipe organs for homes have all been investigated. The course might be likened to a course in anatomy—organ anatomy—and pupils have learned the functions of the mechanical parts; they have learned to know and name the various pipes and to recognize the effects produced by them. During the present term an internationally known authority on the organ will address the classes on the subject of organ pipes and with a complete demonstrating apparatus will show the various types of organ pipes and the variety of tone possible in it.

This school study has awakened a keen interest in organ recitals. When Germani, the honorary organist of the Vatican, gave a New York recital at the Waldorf-Astoria, the pupils were there! They have gone to the recitals of Dr. Heinroth at City College of New York and individually they listen to radio organ music and attend church programs. They bring reports to class of what they have discovered and of features they have enjoyed.

Miss Doran plays the organ during two periods of each day. A large poster announces the name of the selection so that the students in the auditorium may learn to associate the name with the music. During one week the programs are given the second and fifth periods; the following week, during the fourth and sixth. Every Monday at two-thirty in the afternoon, a public program is played. The selections for this are announced in advance in the school newspaper, as, in fact, are all the programs. At Christmas time and on other special occasions, extra recitals of music appropriate to the season are offered and it is possible that, in the future, public recitals may be offered on Sunday afternoons. There ought to be enough music lovers in the Fordham community to make such a plan very popular. Each term Miss Doran plays a request program in some study period. This has proved to be a happy innovation; the requests have always been numerous. None recently have asked for jazz and always there have been several requests for Bach music. It is pleasant to record these facts so decidedly in favor of the younger generation!

Scanned with CamScanner

It may not be amiss at this point to give some of the typical programs which echo through the halls of Roosevelt High School for the joy and benefit of those who would learn the best in music. Had the reader of this article been a listener on the morning of November seventh, he would have heard the following:

1. Morning, Peer Gynt Suite, Edward Grieg.
2. Asa's Death, Peer Gynt Suite, Edward Grieg.
3. Anitra's Dance, Peer Gynt Suite, Edward Grieg.
4. In the Hall of the Mountain King, Edward Grieg.
5. Solvejg's Song, Peer Gynt Suite, Edward Grieg.

On Wednesday, the day before Thanksgiving of this school year, the program was:

1. Elégie, Max Reger.
2. Prière, Clement Loret.
3. O God Beneath Thy Guiding Hand, John Hatton.
4. Lento Assai VII Sonata, Alexandre Guilmant.
5. Hymn of Thanksgiving, Netherland Folk Song.

No formal survey has been made to ascertain just how teachers and students react to these daily recitals, but judging by unsolicited opinions, they are popular. The impressive and stately music drifts to many corners of the huge school building and drives out the humdrum spirit of a large busy place. It is not unusual for a teacher in a distant classroom to send to the auditorium to find out the name of the selection everyone had just enjoyed. Groups of students often drift to the console after a program to ask questions or to chat with Miss Doran. Many have found their way into the special music course from this seemingly casual contact and others enter the organ appreciation classes. And so the organ has come to Theodore Roosevelt High School pupils and they have come to it. Some are learning about it at first hand and all are hearing good music every day. It may not be possible to measure the permanent influence of this "music every day," but as all beauty affects the sensitive human being, so this beauty will have its result. This pioneer work will go on and develop in many ways.

GLADYS L. PERSONS
Theodore Roosevelt High School.

The Bushwick Beacon

Are we fully capitalizing the varied abilities of our student body? Might we not profitably provide more activities to challenge their interests? Is it not educationally justifiable to set before our students an opportunity to plan and carry through a mimeographed magazine in social science? Such thoughts prompted the initiation of the *Bushwick Beacon*.

What follows constitutes a report of what it is deemed fitting to call a product of social science study or can be dignified by calling it a project. While it possessed the virtue of being a unit of purposeful activity, it was not student initiated. We refused to become party to the educational crime of setting bait in the form of pre-arranged leading questions and then trapping and pouncing on the victims with what is equal to "and that is the homework for to-morrow!"

To go into excessive detail would rob the person who may be drawn into attempting a similar enterprise of the many possibilities of seeming originality in the production of a social science magazine or burden him unnecessarily. The task of enriching school life with a magazine of the nature indicated was relatively simple. Essential to success are the following:

1. Easily obtainable materials in the form of stencils, mimeograph paper, paper to provide a suitable cover, and a good mimeograph machine.
2. A student corps which is willing, able, and reliable.
3. An administration which is cooperative.

It is superfluous to say that at Bushwick High School we found all the necessary factors in full measure. Our participating student group was selected from among those who were engaged in the study of our social sciences. They were found by circulating notices in classrooms and by advertising in the school paper. The staff consisted of approximately thirty students. A meeting called outlined the appropriate content and on a volunteer basis its distribution was arranged. The material was to appear in a mimeographed booklet which was to be issued without expense to the school General Organization and to the students. A total of 120 copies was made. All work involved was performed in the school with the exception of the stapling. The school machine could not bind a booklet containing forty-seven pages of mimeograph paper and a fairly substantial paper cover.

The table of contents, among other facts, reveals essays on Washington, Peace, Russia, the Philippines; biography sketches of Briand, Gandhi, Al Smith; humorous essays on the discovery of America and Napoleon; poetry; a playlet on William Jennings Bryan; a column of current comment; a series of interviews with Professors Hughes of St. Johns, Hayes, Moon and Muzzey of Columbia, and Schapiro of the City College; and a cross-word puzzle. Scattered illustrations, such as a page view of Mount Vernon and a sketch history of Theodore Roosevelt, help to complete the magazine.

There was a very liberal expenditure of time involved in production by both the students and faculty adviser. It took approximately two months to complete the work, fashioning vague ideas into a product which seems to have been a success, judging from its reception by the teachers and students of Bushwick High School.

Was it worth while? We emphatically reply yes, without going into any more space-consuming detail than is necessary to state that all were in-

Scanned with CamScanner

terested throughout, kept quite busy, and enjoyed making the *Bushwick Beacon*.

What more is necessary?

A. E. Horowitz.

Bushwick High School.

Opportunities for Training in Character Habits in Class and in School

In the discussion of educational topics we usually set aside a definite period to consider the acquisition of knowledge, and another period for the study of character education. This makes possible the centering of our attention upon one element of the entire educational process at a time. Our environment today is very complex and our adjustment to it, which is education, necessarily has become a great problem. The immensity of this educational problem necessitates its division into smaller units for effective study. This practice frequently gives rise to the fallacious notion that the acquisition of knowledge by our pupils and training in character habits are separate and distinct processes in our educational scheme. We should always be mindful of the unity of our educational program. With the exception of certain instinctive acts, knowledge makes it possible for us to do things; character habits—accuracy, neatness, self-control, sympathy, thoroughness—decide how these things are done.

The educator has as his raw material the inherited tendencies of the pupils and the environment in which we all find ourselves. He skilfully brings these two dynamic forces together to effect a change in both; in the pupils the result aimed at is educated, cultured and refined person; in the environment, a better world. The inexperienced pupil is gradually subjected to environmental forces to develop in him responses better than those he started with. The improvement we call learning. All learning results in changed conduct. Every act has its character implications. Everything a pupil does gives him an opportunity for training in character. The composition is written neatly or slovenly, the commercial law problem is studied thoroughly or superficially, every assignment is performed carefully or carelessly, ranging from a degree of supreme excellence to one of complete worthlessness.

It follows, then, that every opportunity giving a pupil to react to his environment is a chance for character training. And the opportunities in school are many. These opportunities arise in the class on the one hand and in the school outside the class on the other; and in both places they may be initiated by the pupils of the teacher.

We can accompany our pupils during an entire school day from early morning until late in the afternoon and note the many influences constantly at work to develop character habits. These influences would make a long list. Briefly stated, they include our school regulations, which require the pupils to be in school on time, to attend regularly, to be orderly during change of periods and at dismissals; to dress neatly; to care for school property; the varied curriculum with the special character appeals of each subject; methods of teaching that take into consideration individual differences and that provide for drill; the contact of pupils with pupils and pupils with teachers; the extra-curricular activities; and the very layout of the building and its decorations. However, it will hardly be necessary for us to consider more than one or two opportunities for character training in the classroom and in the school outside the class.

Let us begin with the character habit, cheerfulness, which is important for efficient living in and out of school. It creates an atmosphere of happiness in the classroom essential to proper learning. Expert teaching can help to develop this character trait. The teacher who skilfully prepares his pupils for new exercises, divides the work into appropriate units, recognizes individual differences and makes assignments accordingly, will have pupils busy at tasks which they understand and can see through. Success fosters good cheer, frequent success develops the habit of cheerfulness.

The tempo set by the teacher has character training significance. We must teach slowly enough to enable our pupils to do their assignments thoroughly and neatly and get from their work the satisfaction of good work done that will develop in them an attitude toward the subject taught which will make them love it. At the same time we must teach fast enough to present a challenge to every pupil in the room. The proper tempo will help to develop such character traits as thoroughness, neatness, industry, and love of learning.

It must be recognized that the pace is not wholly determined by the teacher and the pupils. Work is prescribed and State examinations must be prepared for. Courses of study are at times over-crowded. Commercial Law may be cited. Teachers of this subject agree that the chief purpose for teaching it in a high school is to develop certain ethical concepts. But the pupils must study the Law of Contracts, Sales, Negotiable Instruments, Bailments, Insurance, Real Estate, Partnership, and Corporations, during one short term. The Board of Regents sets examinations of such a nature that compels the covering of this vast field. The result is a constant nervous rushing in the classroom, shallowness in the treatment of every topic, and an emphasis upon facts rather than upon ethical phases of the subject. The speedy treatment of many topics develops unfavorable character traits of shallow and careless thinking. Teachers should carefully note any such over-crowding of the course of study and make constant recommendation for curtailment where necessary.

The assignment of homework carries with it character training possibilities. It is important to assign homework tasks for which the pupils are adequately prepared and commensurate with their abilities. Assign-

Scanned with CamScanner

ments that are too easy may develop laziness and indifference. Homework that is too difficult tends to inculcate the habit of cheating.

The pupil is highly imitative. Whatever model is set by the teacher will be largely followed by the pupils. The teacher who comes to school on time will encourage punctuality in his pupils, the happy teacher will radiate happiness for his children to absorb, the straightforward teacher will develop honesty in them, and the one who is calm will help his children develop self-control. The teacher who dresses neatly will more forcefully suggest the idea of neatness than he could do in many talks. We may tell our pupils what is expected of them, but the implied suggestion of a good example is by far more powerful.

The classroom is an ideal place to develop the character traits of coöperation and service. A bright pupil should be given the opportunity to help his slower fellow-pupil. Pupils should be encouraged to work together to help keep the boards clean, ventilate the room, keep the floor free of litter.

Habits develop only through patient repetition. The teacher must constantly check up on the pupils in his charge. He must not tolerate unnecessary lateness or absence, careless work, slovenly appearance, inaccurate language.

The school outside the classroom is equally rich in opportunities to develop character habits. Whenever pupils conduct assemblies, regulate traffic, write and manage a school paper, serve in departmental offices, contrib- ute toward social service, conduct dances, present plays, they have a chance to develop habits of coöperation, initiative, sociability, generosity and service.

For our pupils "the school is a special field for their activities as citizens. The proper performance of these activities is the best preparation for the civic duties of the years to follow." In the schools of a democracy emphasis should be placed upon pupil self-government. Our pupils might be put in complete charge of our study periods. They could frame and enforce the regulations under which they could frame and enforce the regulations under which they are to live. This would help develop in them initiative and social-mindedness.

Another similar opportunity is afforded in the conduct of our assemblies. The school can be modelled after our Federal Government into a confederacy of states, each class being the unit; representatives may be selected from each class to form an assembly council from which chairmen of assemblies and program committees are chosen. These committees formulate plans for the preparation and presentation of programs. Such planning and performance call for the exercise of initiative, responsibility, and team work.

The central idea of this discussion is that every experience of the pupil in class, in school, anywhere, is an opportunity for character-habit development. But these same experiences may also develop unfavorable habits. So teachers must through percept, personal conduct, and the example set by great and good men, make certain that pupils know what the approved habits are; teachers must develop in the pupils the right attitude toward these habits so that our boys and girls will accept them as their ideals of conduct, and, finally, teachers must give the students every opportunity for the practice necessary for habit formation.

Seward Park High School.

The Project Method for a Chemistry Club

Several years ago, the writer became faculty adviser to the Chemistry Club of his school. The average membership at the beginning of a term was twenty-five. Meetings were held once a week after school hours. The usual procedure of lectures, demonstrations, visits to industrial plants, or the showing of motion pictures was followed. At the end of each term a prize was voted to the member who had given the best lecture or demonstration.

At this school, a Chemistry course is given during the last three years of the pupil's attendance at school. Those who elect this course study Elementary Chemistry for one year. This is followed by one term each of Advanced General Chemistry, Qualitative Analysis, Quantitative Analysis and Industrial Chemistry. Some of those who join the club are beginning students of chemistry, while others are quite advanced. Not many weeks of a new term pass before the average attendance at meetings drops to a dozen. Those that do attend show a lack of interest and spirit. The beginning student is still interested, probably because he feels that he has more to learn. The advanced student often admits that he does not attend because he does not gain much by attending.

About a year ago, the writer proposed to the club the use of the project method instead of the older scheme of operation. The suggestion met with approval. A new and different type of interest and enthusiasm was apparent. However, over thirty boys presented themselves for membership. Because of difficulties of a physical nature, such as a lack of apparatus, chemicals, and the like in sufficient quantities, membership had to be limited. Since many of those applying were beginning students, the formation of two clubs was decided upon. For the beginners, the Junior Chemistry Club was organized, to be conducted in the same manner as the original club. For membership in the Chemistry Project Club, the successful completion of one year of chemistry is required.

The membership in the Chemistry Project Club is limited to fifteen. The meetings, which are held weekly, are informal and are primarily of a laboratory nature. At the beginning, the boys arrange themselves into groups of two or three to work on a problem. If the group has no particular problem in mind, one is sug-

Scanned with CamScanner

gested. The groups consult the writer regarding the method of using reference works and other matters. The method of procedure is written up. Discussion then follows to clear up any points of difficulty in the method. The groups are then ready to go ahead with the laboratory work. Use is made of any apparatus or chemicals available at the school. Apparatus closets have been set aside for club use only. If any special material is required, it is bought with dues obtained from the members.

The advantages of this method of club operation are manifold. Much new chemical technique is acquired. The boys are given the opportunity to proceed along lines not possible for them in the regular course of study. They are encouraged to go around, at their leisure moments, to watch the work of other groups and to discuss their problems with others. Absence from meetings is due to illness or other unavoidable causes, not because of a lack of interest. The membership remains intact at the end of the term. The boys have decided that the award of a prize is unnecessary, since the successful completion of a project is sufficient reward in itself. Interest in the work of the club does not have to be forced. The boys are glad of an opportunity to work out something that they are interested in. Seriousness is much in evidence. Toward the end of each term, meetings are held two or three times weekly, so that the projects may be completed. A final written report is made and filed as part of the club records. A hektograph pad, with special ink, has been made by one of the members and is being used to furnish copies of each report to every member.

A list of projects completed or in process follows:

(1) Preparation of zinc sulfate crystals from the mineral sphalerite.

(2) Preparation of manganese sulfate crystals from manganese ore.

(3) Conversion of cerium oxalate into cerium chloride.

(4) Extraction of caffeine from tea.

(5) Extraction of quinine from cinchona bark.

(6) Extraction of thorium oxide from monazite.

(7) Extraction of citric acid from lemon.

(8) Extraction of chlorophyll from green leaves.

(9) Preparation of a series of esters.

(10) Preparation of a series of elements.

SAUL S. HAUBEN.

Brooklyn Technical High School.

Pointed Paragraphs

1. Who call upon pupils "in order" need not expect to find them so.

2. To digress is not to progress.

3. It is not a far cry from moralizing to demoralizing.

4. What is clear to the teacher may becloud the child.

5. Water seeks its own level; a good teacher, the pupil's.

6. "Cover the surface and save all" does not apply to teaching.

7. It is possible to go over a topic five times and not get over once.

8. The "each" in "teach" refers to *every* child in the class.

9. Who expects a response must hold each responsible.

10. A request for "volunteers" may result in the last syllable only.

11. Where there is tension in attention, there is usually inattention.

12. The student's standing is a measure of her understanding; her understanding is a measure of her teacher's standing.

13. Supervision implies vision.

14. Take not the quest out of questioning lest there be more rest than interest.

15. Let not our theme song be, "Over the heads and far away."

16. History, unlike the good teacher, repeats itself.

17. To educate is to draw out, not drive out.

18. Who teaches the subject, and not the child, does not teach.

19. Marks should not provoke remarks.

20. In our educational balance sheet, pupils should appear as assets, not liabilities.

21. Our job is to provoke thought, not to provoke.

22. Who preaches, seldom reaches.

23. Help pupils to help themselves; otherwise the more you help, the less you help.

S. W. Fox.

Washington Irving High School.

A Practical Art Project

Show-case displays, whether scientific displays of museums, or merchandise displays of retail stores, have always attracted attention, but a display of either sort needs a certain amount of organization and selection before it can be really effective. The Poster Club at Far Rockaway High School decided that there was a great deal of material at the school to be shown in this manner. This material could be found not only in the constructive work of the art and domestic science classes, but also in the project work attempted in the academic courses. It became the purpose of the club to work out suitable backgrounds for an exhibit of this type.

Store window displays were discussed by the Club. The general opinion was that most of the windows in the neighborhood stores, as well as the cases around the school were poorly arranged and did not secure maximum attention. The main faults were:

1. Overcrowded windows,
2. Lack of definite color harmony,
3. No change of eye-level to secure distribution of attention.

Various types of windows were criticised. The club noticed that different objects required different types of settings. Drug stores, cigar stores, and a few dress shops used to best advantage displays employing a pictorial setting. Articles such as perfumes, hats, shoes, and accessories appeared most effective against a modernistic setting. A realistic background was

Scanned with CamScanner

best arranged for furniture houses, transportation companies, and real estate brokers.

The club decided it preferred to start with a modernistic setting, which would permit the use of simple block and set-back shapes arranged at various heights. It eliminated many details and could, therefore, be worked up more quickly and easily. The subject chosen to fit this type of setting was perfumes and powders. The club decided on this because bottles and cans, such as ink bottles, medicine bottles, paint cans, and the like, could be painted and labelled. Cardboard caps of various shapes were to be added to give a finished effect.

With the subject decided, each member drew a small sketch of what he felt would be an attractive modernistic window display. The results were placed on the board, discussed, and voted on. The one chosen was then considered for possible color harmonies. The result was a model store window consisting of two high set-back block shapes, two small shelves, and a large crescent background. A printing cut-out was to stand in the foreground. Because the crescent shape in the background gave a suggestion of the moon, the colors chosen were a bright blue background, a gold crescent, darker blue set-back and shelves. The small objects were to be painted coral, pale yellow and light blue.

The design was enlarged to the correct size by working to a scale. Each student was given one particular part to enlarge. One boy received the background to paint, another a crescent to cut and paint; a girl had to design and cut labels, while another had to cut out and print the letters. This work, since the club meets once a week, extended over four weeks.

Then all was ready to be put up. The glass shelves in the hall case were removed. The background was fastened in, the block sections were put up, the shelves pasted and tacked in, and all was ready. This actual set up, however, took much longer than had been anticipated. Several difficulties arose as the various parts were added. The background, because of metal ribs in the back of the case, could not be fastened against the wood, but had to hold about a half inch away from it. This prevented the shelves and block sections from being fastened to a solid back. This was finally overcome by inserting small wooden boxes inside the large cardboard blocks to give a solid support at the corners. Another difficulty to be met was in cutting the letters from cardboard. The club finally bought a small saw which gave a rough edge, but was much better than any other cutting device we had.

It was generally conceded that the final result was worth the time expended. The case has attracted a great deal of attention at the school. As a club project, it was more than a success, as has been shown by the eagerness of the members to start another, the willingness of the club to stay very late, and by the interest of each member in finishing his part

tion of the case. There were none idle at any time. When a member's assigned work was completed, he always eagerly turned to painting a bottle or can which had been brought in.

There are several possibilities being considered for a second case:

1. A display of book covers planned in the Art Appreciation Course, to be exhibited against a modernistic background.
2. Christmas cards, boxes and papers to be shown against a realistic background of snowy landscape.
3. Cardboard manikins displaying proper clothes for school wear.
4. Small boat models of cardboard set against a realistic seascape.

The Domestic Science department has offered to make small objects, such as doll's clothes, laundry bags, or embroideries which might furnish possible display material.

Once started, this case could be made the main display case for all class projects and become part of the regular work of the club.

DOROTHY NEVINS.
Far Rockaway High School.

How the American Boy Learns to Write

Sir Philip Sidney, searching for extravagant phrases to describe his amorous passion, saw the futility of "turning others' leaves, to see if thence would flow some fresh and fruitful showers upon my sunburn'd brain; but words came halting forth, wanting invention's stay." When he saw the light, "Fool," said my Muse to me, "look in thy heart, and write." How shall we encourage the American boy to look in his heart and write?

The last few minutes of one period were devoted to a discussion of family albums. Attention was directed to keeping an album of one's own; but this time the album would be written pictures, instead of photographs. We decided to call it "My Album-Journal."

The following day I asked if anyone could tell me how a student who needed the means with which to buy a football could obtain it. This led to several volunteer stories on "The First Money I Earned." Because there was not enough time to hear everybody, the class was asked to write the first record, or chapter, for the "Album-Journal."

When three chapters had been written, the students became interested in the decorative aspect of the project. After they had prepared an attractive cover, they studied the illustrative possibilities of their stories. It was decided to adapt the patterns set by magazines. Pictures cut from periodicals were pasted on a separate sheet, each picture bearing a caption borrowed from the illustrated story. Some students created their own illustrations.

Among other records the following were decided on, each one introduced in the manner of the first:

"I Shall Always Remember."
"If I Had Listened."
"Daydream."
"My Friend."

Scanned with CamScanner

In tabulating the results of my first records, I found that students had earned money through delivering papers, working with hucksters, running errands, minding babies, cleaning house, serving as grocery clerk, posing for a photographer, sewing buttons and collars on coats for factory workers, messenger boy for telegraph companies, mechanic, plumber's helper, and so forth.

If the kind of work performed by the pupils is not rich enough in interest, let me say that the reasons for working should touch the most cynical: to buy clothes, to contribute to the family income, to buy gifts, to pay for operations, to buy food, and so on. Each pupil is a storehouse of experiences worth long labor, difficult though it be, to penetrate. There is dignity in the emotion called forth by the performance of such a simple task as delivering a parcel for a neighbor, from whom the student refused to accept remuneration "because she couldn't afford it." There is drama in a recollection:

> "At first I was calm. But when I found that I could not touch the bottom, I began to be afraid. Then I began to sink. I made the sign of the cross, and then with all my strength I managed to reach the pier. The first thing I did when I reached it was to thank God."

There is promise of early maturity in the child of poverty who writes, "If I were rich, the first problem would be to consider the misfortune of others. . . . One does not need wealth to be happy . . . nevertheless, if we have a good job and a cozy home, nothing else matters."

What is the enterprise worth? The writing of compositions has become no mere daily assignment. Each composition is motivated not only by a desire to express one's self, but also by a realization that each composition is a chapter in a unified record of vivid life experiences; the "Album-Journal" is a coördinated work, revealing and critical.

ALLEN KANFER.

Grover Cleveland High School.

Do It Alone!

As I pored over a set of compositions, my trained eyes and brain reported on and protested against a phrase or sentence—suspiciously familiar! I looked back and found the other paper.

Next day I told the class that some one had obviously handed in work that was not his own, and that I wanted the two students involved (they would know whom I meant) to stop a moment after class. When I found six students at my desk, instead of only the two I had expected, I barely caught myself in time from asking the other four what they wanted; light dawned.

Later I was reading reports written by a superior class. Two of them included reviews of "The Red Badge of Courage," and in each I discovered a phrase including the word "writhe"—uncommon enough for the repetition of it to cause the mechanism of suspicion to function. The writers (two excellent and interested students) explained that they had discussed the book; that one of them had used the phrase; that each, when writing her report, had remembered and used it; that they often discussed their work. They seemed to find it difficult to understand why I had brought up the matter; and as I spoke to them, I found it equally difficult to justify my having done so.

Aldous Huxley, in his essay "Education," in Proper Studies (1928) writes (p. 155) in extolling the Dalton Plan, "The silence of the old classroom is abolished, and with it the preposterous notion (based on the evil system of competition and mark-grubbling) that it is dishonorable and punishably criminal to give help or to be helped by one's fellows."

I report these incidents not with the purpose of proposing any reforms, nor, I hope, because of a failure to recognize the new trends, but because they were disturbing, and "gave me to think." Perhaps, in spite of the trends, we are still unhealthfully influenced by the demands of our marking and grading systems.

MANUEL PRENNER.

James Monroe High School.

Reports on Leisure Reading: Life and Literature

An interesting variation of the usual type of report on novels or biographies read outside of class is the following form, which requires the student to compare life with literature. I asked the students to write a paper comparing the books which they had read outside of school with the circumstances of their own lives, specifying certain definite topics for their discussion. I elaborated on the topics in some such way as in indicated below:

(1) Setting: What is the time and place of the story you read? How does the setting compare with your own surroundings?

(2) Kind of people: Are the people of the novel similar to or different from the people you meet in your daily life—your friends, your parents' friends, your relatives? Are the story characters kinder or crueler, more or less educated, wiser or more thoughtless than people you know?

(3) Things that happen in the story: Mention several incidents of the story which will give the reader an idea of the kinds of adventures one finds in the book. Are the things that happen to these characters more or less exciting, interesting, complicated, depressing, or inspiring than the things that happen to you and to people you know?

(4) After considering these topics and drawing a comparison between the book and your own life, decide whether you would rather be a character in the book or whether you would rather continue to be yourself.

Some interesting results were obtained from this experiment. Its chief value, of course, lies in the fact that the students actually consider the

Scanned with CamScanner

books they read in the light of their own surroundings and experiences.

PAULINE T. KANE.

Washington Irving High School.

Better Speech Week at Girls Commercial High School

One Monday morning in November there was seen about the halls of the Girls Commercial High School a number of girls wearing red badges. Before the day was over another, ever-growing, group with white badges made its appearance.

Better speech week was in progress.

The red-tagged girls were speech detectives, members of the Speech Club, and girls especially selected from English classes of the 8th and 5th terms. The white-tagged girls had been "arrested" for some infringement of the laws of good speech.

Every girl who received a white tag was required to present herself before a court, prove that she knew the error she had made, and how to correct it; also pay a fine of one cent for the benefit of the Student Aid Fund.

The Speech Department had determined to make the school, for one week at least, vitally aware of the possibilities and advantages of good speech and the drawbacks of poor speech.

The court idea was only one method used to do this.

The coöperation of the Art Department was sought and there appeared in the lunch room and halls beautifully lettered posters bearing such slogans, advice, and admonitions as "Think before you lisp"; "Stop, look and listen to your speech"; "There is no joy in Jersey"; "Daisy wore a stylish dress but she would say yeah for yes"; "Hend for hand should never stand; terl for toil your speech will spoil."

The Wednesday assembly period was allotted to the department and a special program was prepared. The week before, appropriate words had been written to the popular tunes "As You Desire Me" (As you desire it, your speech can be), and "At the Mardi Gras" (If you speak in a tone that is soft and sweet, you will find that the world will be at your feet.) They were distributed among the classes to be learned and sung at the assembly.

Two short plays—with morals—were written for the occasion and presented by the Speech Club and a group of girls from a 5th term English class. (This term has speech five periods a week.)

The first play depicted a scene in a trolley car—girls going to school. The well-spoken girls contrasted with the noisy, careless ones who could not understand why they were unsuccessful socially and in the business world. This play, being true to what the girls knew and heard every day, and being somewhat humorous, was enthusiastically received. The second was a pantomime acted as one girl read the story, accompanied by the piano, to the tune of "Clementine." This tale dealt with a pretty and styl-

ish maiden who could not make a living on account of her poor speech. She was rescued by a "tall and handsome stranger" who taught her to speak well and then falling on one knee, to the great delight of the audience, begged her to marry him.

The songs were sung by the whole assemblage and the entire program was considered a success by the department and, more important still, by the school.

This is our first attempt. We know there are many ways in which we might have been more effective, but we do feel that the pupils—and the teachers—have become, temporarily at least, speech conscious, and we consider that the venture has been worthwhile as a beginning of other and better campaigns for good speech.

MILDRED W. BOLLES.

Girls Commercial High School.

Theodore Roosevelt Spelling Lists Widely Recognized

Dr. Charles Robert Gaston, Chairman of the Department of English, had long cherished an ideal for the organization of spelling; and so, when Mr. Harry M. Love suggested a revision of the term word lists, what was intended as a step toward simplification became a thorough-going scientific process in which the great authorities, such as Ayres and Thorndike, were consulted, with the result that, after a weighing of thousands of words, there were finally selected eight lists of one hundred each which satisfied a double standard, namely, difficulty in spelling and frequency in use. In other words, we resolved not only to get rid of a medieval emphasis on difficulty for its own sake, but also to build up such a vocabulary of common words as the average student in each grade might well master for daily use in writing and speech. A description of these new "friendly" lists appeared in an article published in HIGH POINTS. The lists were printed in connection with the discussion.

In September of the present year, editorial mention of our new attitude toward this vexed problem appeared in an issue of the *New York American*, with comment on the whole favorable; and the editor of the *World-Telegram* soon after drew further attention to our spelling reform. Requests began to come in from the most unexpected quarters for copies of our graded words, and the tide of applications swelled when that international newspaper, *The Christian Science Monitor*, advised its far-scattered readers of the innovation established by our school, and further extended its powerful influence by a radio broadcast of the good news.

While we are unpersuaded that our own revisions have reached an ideal goal, at least we take satisfaction in having struck a blow for human freedom. The Fourteenth Amendment to the United States Constitution—does it not apply to minors as well as grown-ups, and is it not "slavery and involuntary servitude" to compel some healthy lad to suffer from *dyspepsia, hemorrhage, arteriosclerosis* and other horrors? Should we require of a

Scanned with CamScanner

bright, cheerful girl—*antipathy, lassi-*
tude, and *disingenuousness?* Our Charter of Liberty says something also, does it not, about "cruel and inhuman punishments?"

We are content, in a word, that our graduates should enter the world of business and social life with this modest bounty of eight hundred counters of verbal wealth, all of which are fully understood and often used, and—correctly spelled!

Nothing in our care of these minima is intended to restrain the building up of a vocabulary of recognition, so much needed in the reading of fine literature. But the preparation of lists for the understanding and appreciation, say, of the works of George Eliot, or Nathaniel Hawthorne, is left to the initiative of the individual teacher.

Analysis of the Errors Made in the June, 1932, Short-Hand II Regents' Examination

Last June, in a survey as careful as the brief time permitted for the handling of the Regents' Shorthand papers allowed, some interesting facts were disclosed. It is because I am confident these will prove as thought-provoking to others as they have to me that I pass them on. The study, although it originated chiefly with the idea of locating specific weaknesses in our students with a view to subsequent application of remedial measures, proved just as enlightening in a radically different direction.

From the viewpoint of the original purpose, a study of the accompanying table, the numbers of which represent totals of actual percentage losses, discloses the fact that more than half the penalties (54% of them, to be exact) were for errors in English, 26% of this 54% on paragraphing and punctuation alone! It was enlightening to note that the penalties deducted for the hyphen error comprised 6% of all penalties. The apostrophe difficulty cost us a total loss of 2%, and our actual spelling errors, the commonest of which were *salable, usual, among, shipment, handle, basis, persistence, intervals, concern, secretaries, correct, comply, exceed, valuable, crescent, today,* brought us down 13% lower than we might have been. It is discouraging to note how great were the type (or careless copying) errors that caused spelling penalties—16% of all spelling erors, 4% of all deductions. Careless capitals, too, caused appreciable minor deductions. As for actual shorthand difficulties, by far our greatest weakness (30% of all errors, 70% of shorthand errors) lay in substitution with omission weakness following as second. The substitution of a singular and plural (notably *requirement-s, economy-ies, opportunity-ies, reference-s*) cost a loss of 70 credits while the *a-the* fault occurred no less than 22 times. Tense change, as *learn* for *learned*, appeared on 17 papers and the following faults, though varying in frequency, were all sufficiently common to warrant comment:

1. Gram.; *of-to, for-in, that-with, all-and, those-this, as-his, should-shall* (hearing?).
2. Stroke size, slant or curvature; *what-account, only-until, few-future, appropriate - proper, shop - establish, filled - handle, might-say, immediate-you, may-madam, affords-offer, it is-this, address-draft, great-credit, confidence-evidence, credit-correct.*
3. Vocalization; *lowest-least, apply-comply.*
4. Numbers; each digit of which had to be separately charged for.

As for omission faults, students were notably careless with these words: *a* (17 times) *that*, a second *had* and in a discouraging number of cases, whole series of words that investigation found legibly written in the notes, or words that were given on the board for inside addresses! From these findings, it would seem that our greatest progress the coming term may be made by apportioning our teaching time in accordance with these disclosures. Certainly, while our Regents' requirements remain as they are, it would seem good policy at least to spend half of our time on those phases of English spoken of above, and the remaining time on the perfection of shorthand outlines, stressing again the weaknesses manifested by the tabular statistics.

While making this investigation, especially when recording the multitudinous number of paragraphs and punctuation errors, as well as recurring bonus deductions, another thought aside from that of remedial work occurred to me—a thought that we were getting far afield in our aims. According to the new psychology as advocated by our leading educators of today, the elimination of all useless material and the substitution of those habits, ideals, attitudes and that knowledge that have the greatest and most numerous use—that are, in a word, most serviceable in the social (and industrial) life the student will eventually pursue, must be the criteria of all aims of education today. In spite of such drastic changes in education theory promulgated in the last century, much of the old theory predominates in our present commercial education, made necessary by Regents' requirements. In the matter of the bonus alone, where can its counterpart be found in business today? Aside entirely from its unfairness, from the standpoint of the modern business procedure, it has no practical justification. It is time for it to go. It does not, moreover, take much experience with the accepted business correspondence of today, nor great acquaintance with the literary writers of the current day literature (who have in many cases even gone so far as to discard the complete sentence!) to realize that old forms are being discarded and new modes taking their place. In view of these modern trends, to quibble over the placement or omission of an unimportant comma (and it is not long since that a convention of department heads argued at great length to settle such questions, only to return to their home

Scanned with CamScanner

schools and penalize students for what were there moot points), in a short letter of 120 words, all on one subject anyway; to be terribly concerned whether the paragraph shall be here or there, to have to submit to goodness-knows-what group whose sacred word at Albany establishes these points, makes us all ridiculous victims of a system that has not kept abreast of the times. I do not argue for the drastic changes advocated by many of our present literary writers, but I do believe a more sane policy than insistence on rigid adherence to outgrown forms is highly desirable. The words of John Dewey, in his "Schools of Tomorrow," bespeak an ideal we might well pursue! "The problem of educational readjustment thus is to steer between the extremes of an inherited bookish education and the narrow so-called practical education. . . . But since the real question is one of reorganization of all education, to meet the changed conditions of life—scientific, social, political—accompanying the revolution in industry, the experiments which have been made with this wider end in view are especially deserving of sympathetic recognition and intelligent examination." And that, I feel, in the field of commercial education and particularly in Regents' standards, is as far as we teachers are concerned.

Below is given a tabulation that may be of interest to shorthand teachers.

Aims and Motivation in Stenography and Typewriting

It is difficult to separate aim from motivation because the teacher should conduct the lesson in such a way as to make the students' aim correspond with that of the teacher. In other words, the students must be made to feel the necessity of learning whatever the topic happens to be, and this process is called motivation.

One method of motivating the stenography class is the use of the problem sentence, which is a sentence containing familiar words with the exception of one, and this word involves the point the teacher wishes to present. This method is known as the Sentence or Analytic Method.

Another method of motivating the lesson may be employed in connection with the Inductive Method. Motivation, as has been stated, is the process of making the student feel the necessity for learning the point the teacher wishes to present. In the learning of the word signs, instead of the students' accepting the form given the text, and learning each sign by rote, an explanation which will show that the forms for the word signs are not haphazard, may be given. They will readily realize that the explanation will help them to remember the word signs, and will enable them to increase their shorthand vocabulary.

An illustration of this method follows: The aim of the lesson is to teach that final *t* is omitted after *s*. The review should consist of the matter studied in the preceding lesson, and the following words: *must, list, against, trust,* all familiar word signs, and yet all are illustrations of the rule the students are learning. The teacher asks what these words have in common, and the students are thus led by their own knowledge to the formation of the new rule. As soon as the words are listed and examined, the students will realize the necessity for a rule governing all of them.

Whatever the aim of the lesson, it should always be clear, specific and known to the pupils. Among the aims in teaching shorthand is a knowledge of symbols for all sounds, of rules for joining these symbols, of

Scanned with CamScanner

the abbreviating principles, and, in correlation with typewriting, rules for letter placement. But knowledge or understanding of these rules, will, alone, not enable the student to take a letter from dictation. It follows then that a second aim in the teaching of our subject must be the inculcation of skill, that is, the ability to use knowledge with ease, speed and accuracy. In other words, knowledge must be reduced to a set of habits. Both knowledge and skill must, of course, be inculcated with a view to their usefulness in actual life situations.

With regard to knowledge, the aims of shorthand are the learning of the principles of the system, word signs, vocabulary, word building, the reading of shorthand notes, and, in connection with typewriting, the setting up of shorthand transcription.

With regard to skill, the aims of shorthand are to learn to write the proper *legible* symbol for each word; to learn to recognize word signs *instantly* and to write them *automatically;* to learn to recognize and write stock phrases *with ease;* to learn to recall *instantly* the outlines for particular words and to execute them *automatically;* to learn to apply known shorthand principles to new words *rapidly;* to learn to read shorthand outlines as intelligently and precisely as longhand; to develop and increase word-carrying capacity; to learn to transcribe with ease on the typewriter, this in connection with typewriting.

In Typewriting, as in Stenography, the problem of motivation is less difficult than it is in other subjects, because the students realize the practical value of the two subjects.

In Typewriting I, at the very beginning of the course, the teacher may motivate the class in connection with the touch system by explaining in simple graphic terms the results achieved by a group of students studying by the old sight method, and another group using the touch method. These results were set forth in detail by William Book in his "Psychology of Skill as Applied to Typewriting."

The teacher can motivate rhythmic typewriting by demonstrating a line of type done in uneven rhythm, and show the uneven spacing and touch resulting. Since the students enjoy the feeling of creating a perfect piece of work, they will want to avoid a practice which will result in poor appearance.

Where the work in any subject resembles its functioning in real life situations, the students are bound to feel more profoundly the need for learning the subject. For that reason the sooner the class proceeds from letter combinations to words (without, of course, limiting the amount of drill necessary for the former), from words to sentences, to paragraphs, and finally to letters, the better will the class retain interest in the subject.

The artistic features of typewriting never fail to interest the students. For this reason, a class can be motivated by being shown artistically arranged material, and being asked to make a perfect reproduction of the model.

A very live form of motivation is a demonstration of accuracy at a good rate of speed by the teacher.

Where time allows, the teacher may permit the students to keep accuracy charts as illustrated below:

Mary Jones	October											
	1	2	3	4	5	8	9	10	11	12	15	etc.
100												
90												
80												
70												
60												
50												
40												
30												
20												
10												
0												

An example follows: On October 1, Mary Jones typed 50 words and made 3 typewriting errors. She deducts 3 from 50 and finds that she had 47 perfect words. She reduces the fraction 47/50 to per cent, and find that her percentage of accuracy is 94% for October 1. On October 2, she typed 100 words, and made 12 errors. Her accuracy percentage for this date would therefore be 88%. A broken line would represent her rate of progress or the reverse.

The aims of typewriting are first and foremost accuracy. The word "speed" should not be mentioned before the second year, and even then it is hardly necessary; for the student who is typewriting with accuracy will develop a higher speed gradually. His knowledge of typewriting should also include the parts of the machine with which he comes in contact, the folding of letters, the setting up of letters, the typing of envelopes, bills, telegrams and other special business forms, the use of the carbon, stencil cutting, tabulation; in correlation with the English—the correct syllabication and abbreviation of words, and, in correlation with stenography, transcription of shorthand notes.

Lillian C. Heisler.
James Monroe High School.

Syllabic Intensity of the Regents' Shorthand Examination

Teachers of dictation classes have noticed for some time that they could dictate a letter at a certain rate of speed and find that every pupil had taken it down with ease. But then the teacher dictated another letter at a same rate of speed she might find that perhaps 5 or 6 pupils had successfully noted what she had dictated. It was known that some material was more difficult than others, but the letters were not graded as to difficulty until some time ago.

It was found that some letters had 120 syllables to every 100 words. Other letters had 180 syllables to every 100 words. Therefore, although the teacher might still be dictating at the same rate of words per minute, the number of syllables might often vary from 120-180 per minute.

One or two of the newer dictation books have adapted this method of dividing words into syllables, and have arranged the letters according to syllabic intensity. It is therefore, easier

Scanned with CamScanner

now for the teachers to grade the difficulty of the dictation.

Preparation for the Regents' Examination is always a problem, and teachers have always had difficulty in deciding just what kind of material to dictate. To dictate material that is too easy will give the pupils no preparation. To dictate matter that is too difficult is discouraging. One of the editors of the American Shorthand Teachers investigated the syllabic intensity of thousands of business letters, and found that the average was about 140 syllables to every 100 words, that is a syllabic intensity of 1.4. This investigation has been used as a guide by many teachers in choosing material to be dictated to Regents' Classes. In spite of that, pupils have complained that many of the Regents' Examinations are too difficult.

In order to ascertain the difficulty of the Regents' Examinations, I made an investigation of the syllabic intensity of the letters given during the past few years. It will be seen that the range is from 1.3 to 1.8. It is therefore, advisable for the teachers who wish to prepare their pupils properly to dictate matter within this range of intensity.

The following is a tabulation of the syllabic intensity of letters given in the Regents' Shorthand Examinations from January, 1928 to January, 1933.

SYLLABIC INTENSITY

REGENTS' SHORTHAND EXAMINATION

JANUARY 1928-JANUARY 1933

Letters	1	2	3	4	5	6	Average
January, 1928.....	1.55	1.52	1.66	1.55	1.53	1.57	1.56
January, 1929.....	1.66	1.47	1.45	1.88	1.49	1.46	1.56
June, 1929.....	1.36	1.55	1.41	1.59	1.69	1.69	1.54
June, 1930.....	1.30	1.58	1.76	1.73	1.72	1.50	1.64
January, 1931.....	1.46	1.32	1.40	1.30	1.52	1.73	1.43
June, 1931.....	1.55	1.58	1.59	1.58	1.79	1.53	1.60
January, 1932.....	1.08	1.36	1.49	1.47	1.39	1.55	1.39
June, 1932.....	1.40	1.42	1.39	1.52	1.48	1.60	1.47
January, 1933.....	1.48	1.54	1.56	1.42	1.70	1.57	1.59

M. E. ZINMAN,
Chairman, Shorthand Department.

Abraham Lincoln High School.

EDUCATIONAL NOTES AND ANNOUNCEMENTS

Citizens' Conference Asks Priority for Education

"Our Nation faces the acute responsibility of providing a right-of-way for the American child," declared President Herbert Hoover in opening the Citizens' Conference on the Crisis in Education which he called in Washington, D. C., on January 5 and 6.

"We may delay other problems but we cannot delay the day-to-day care and instruction of our children. This conference is unusual, in that it invites the coöperation of men of widely different points of view in consideration of our school and tax system from the standpoint of maintaining the welfare of the children of today."

The group of men and women meeting in the National Academy of Science at the President's call was not unlike a school board. Familiar civic interests were represented by 71 national leaders. Spokesmen for the five groups who coöperated in calling the conference were: Frank Morrison, American Federation of Labor; Dean Charles H. Judd, American Council on Education; Louis J. Taber, National Grange; Charles E. Hearst, Iowa Farm Bureau Federation; Howell Cheney, National Association of Manufacturers. Among the other participants were President Rosier of the National Education Association, Mrs. Hugh Bradford, President, National Congress of Parents and Teachers; Mrs. Grace Poole of the Federation of Women's Clubs; and John J. O'Connor of the United States Chamber of Commerce.

The members of the conference were at once informed of the extent of the crisis in education in reports by the Office of Education and the National Education Association summarized in a pamphlet, "The Current Situation in Education, Increased Responsibilities—Decreased Revenues." They listened to statements made by representatives of various participating groups on needs and remedies. They discovered that each group was devoted to the cause of adequate public education.

Dividing into six committees, the conference endeavored to agree on prescriptions for the succor of education in the crisis. The six committees discussed: (A) Relation of Expenditures for Education to Expenditures for Other Public Service; (B) Organization and Operation of Instruction; (C) Buildings; (D) Higher Education; (E) Relations of Schools and Other Social Agencies; (F) Legislation.

After two days' vigorous and earnest discussion the conference adopted 40 recommendations. The declarations include suggestions for the President and Congress, governors and legislators, school boards, superintendents and citizens. Those which are probably of chief interest are in brief:

Scanned with CamScanner

Local governments and local school districts should be reorganized and consolidated.

Administrative control of the schools must be centralized in the superintendent.

State administrative organization of education must be reorganized through creation of a non-political and professional agency for administration of educational policies.

The State must assume the responsibility . . . assuring adequate public education to all local communities. . . .

We especially urge law-making bodies to give priority to legislation which will alleviate conditions in communities now being required to make injurious curtailments in their school programs because of unusual burdens, inequitable tax systems or faulty fiscal machinery.

We urge Congress to provide for Federal assistance through emergency loans for a limited period to such States as may make an adequate showing of their inability to maintain reasonable standards of support for public school education.

. . . immediate reformation of the system of taxation.

Immediate efforts should be made through the raising of the general level of commodity prices, the correction of serious economic maladjustments, and otherwise, to increase the volume of income and purchasing power, and thus to provide the moneys necessary for a proper educational program. If this is not done, wide-spread injury will result, not only to the cause of education, but to the value of all obligations, public and private. . . .

. . . recommends . . . consideration by another conference . . . of steps . . . for increasing the level of income and of purchasing power.

. . . opposed to the shortening of the school year below the term existing previous to the depression. . . .

The teaching load should not be increased either in courses or hours, beyond the ability of the individual teacher to offer a reasonable standard of instruction to each pupil, and should be adjusted in relation to the quality of supervision, the experience and qualifications of the teacher, the provisions for exceptional pupils, and the methods of grouping pupils.

The size of classes in all special subjects such as art, music, manual and domestic arts should be made as large as that of the average academic class; in secondary schools laboratory periods in the sciences should be of the same length as periods for other subjects, and standards of accrediting agencies which now prevent such arrangement should be modified.

. . . postponing of building construction . . . reorganization of business departments . . . adjustment of the size of class; and . . . curtailing the activities of auxiliary agencies, etc., . . . before readjustment of teachers' salaries. . . .

Readjustment of salaries, if necessary, should be made in relation to the reduction in the cost of living of the teaching group in any given community. . . .

Consideration should be given in a long term building program to the fact that unit costs are probably at a minimum. . . .

Careful study should be made of the purchase, distribution, and utilization of fuel and other supplies used by building employees. . . . The number of building employees should be kept at what is actually needed. . . .

Careful attention should be paid to the preparation of proper specifications, the purchase, distribution, care and use of all supplies and equipment. Permanent inventories in all cases should be maintained. Where school districts are small, coöperative plans of purchasing supplies and equipment might be made under the initiative of State departments of education. . . .

. . . effective, economical and non-political operation and adaptation of the plan of popular education, at all levels, from the elementary schools through the universities, are fundamental obligations of the American State. . . .

The essential limitation upon attendance on secondary schools of any grade is the requirement that the student give such evidence of a continuing and developing ability to learn. . . .

. . . there should be set up in every locality, councils broadly representative to mobilize and clarify public opinion in the present crisis in education.

. . . The home, the Church, the library, all must be maintained and strengthened along with the schools . . . adult education must not be forgotten. . . .

The Conference notes the critical condition of certain under-privileged groups, particularly the Negroes. . . .

. . . We recommend that the Office of Education give nation-wide continuing publicity to efforts of various localities in moving promptly and energetically to maintain and extend their social services.

. . . regrets Congress found it necessary to discontinue the study of school finance carried on under the direction of the United States Office of Education . . . hope ways may be found to resume study.

—*Release of the Office of Education, United States Department of the Interior.*

President Hoover's Statement on Schools

"Our Nation faces the acute responsibility of providing a right-of-way for the American child. In spite of our economic, social and governmental difficulties, our future citizens must be built up now. We may delay other problems but we cannot delay the day-to-day care and instruction of our children.

"This conference is unusual, in that it invites the coöperation of men of widely different points of view in the consideration of our school and tax system from the standpoint of main-

Scanned with CamScanner

taining the welfare of the children of today.

"Our governmental forces have grown unevenly and along with our astounding national development. We are now forced to make decisions on the merits of the various expenditures. But in the rigid governmental economies that are requisite everywhere, we must not encroach upon the schools or reduce the opportunity of the child, through the school, to develop adequate citizenship. There is no safety for our Republic without the education of our youth. That is the first charge upon all citizens and local governments.

"I have confidence that with adequate reduction of expenditures there can be ample amounts obtained from reasonable taxation to keep our school system intact and functioning satisfactorily. Those in charge of the schools must be willing to face conditions as they are, to coöperate in discarding all unnecessary expenditures, to analyze all procedures, and to carry forward on a solid basis of economy. But the schools must be carried on.

"I wish to thank you for giving of your time and coming here to Washington for this meeting. I trust that out of it will come recommendations that will be of national significance.

"Above all, may I ask that throughout your deliberations you bear in mind that the proper care and training of our children is more important than any other process that is carried on by our Government? If we are to continue to educate our children, we must keep and sustain our teachers and our schools."

Secretary Ray Lyman Wilbour Urges Fight for Schools

"You have met to decide what will happen to this generation of American children—what can be done to see that the boys and girls of today are not robbed of their educational birthright. You must take an aggressive attitude toward schools if we are to keep them open. It is not a matter of passing resolutions but a matter of fighting. Fight through! Figh highways! Fight politics! Fight all groups! It is worth while."

—*Release of the Office of Education, United States Department of the Interior.*

Character Development for Citizenship

The National Self Government Committee has received a most reassuring report from the Board of Regents of New York State on

CITIZENSHIP TRAINING IN PUBLIC SCHOOLS AND COLLEGES.

As is well known, teachers protest they cannot pay more attention to *character* development for citizenship because Regents' or college requirements of *scholarship* are so severe.

The Committee recently urged the Regents to steer the course set by the Fathers of the Republic, namely, a public school system devoted primarily to citizenship and government: (To quote only a few.)

Franklin: "for public service"

Washington: "an enlightened opinion on self government"

Madison and Monroe: "for government."

The Regents' reply to the Committee agrees with this viewpoint and out of a long report the following concluding page tells the story:

THE BOARD OF REGENTS OF THE STATE OF NEW YORK

"A REPORT ON CITIZENSHIP TRAINING IN THE PUBLIC SCHOOLS AND COLLEGES OF THE STATE"

"The Department contemplates a complete revision of the syllabus for citizenship and patriotism, based upon the fundamental philosophy that 'a child learns by doing.' Such a syllabus will suggest to the teacher many ways of providing for pupil participation in the control of home room and of the school.

"Growing out of curriculum study in the secondary school is a demand that the Department, with the assistance of public school teachers and supervisors, prepare a syllabus in social science, the subject content of which will take the place of that now outlined separately under the various subject titles: Civics, History A, History B, and History C. This syllabus will suggest to the teacher how to organize and guide many worthwhile group activities closely allied to the classroom work. A growing adolescent does not need the factual material of four separate unrelated courses, but an acquaintance with the simple and fundamental principles of social responsibility which will tend to make him an intelligent and useful member of a social group.

"The department plans to make a survey of the status of student participation in the government of the elementary and high school. The results of this survey will indicate what steps must be taken to assure the public that the school is keeping an even balance between book-work and worthwhile social activities. It will be the aim of the Department to see that every pupil has an opportunity to participate in the civic and social life of the school so far as he is able, realizing that it is through participation—'doing'—that citizenship becomes meaningful."

CHANCELLOR OF THE UNIVERSITY.
VICE CHANCELLOR OF THE UNIVERSITY.

Pan-American Day: A Proclamation by the President of the United States of America*

Whereas the Governing Board of the Pan American Union, at the session held on Wednesday, May 7, 1930, adopted a resolution reading as follows:

"Whereas, it would be desirable to recommend the designation of a date which should be observed as

* This year Pan American Day will be celebrated in New York City in a program given under the auspices of the Pan American Society the afternoon of April 11, in the ballroom of the Waldorf-Astoria. The program will be in charge of students from the high schools, with the coöperation of the Pan American Student League.

Scanned with CamScanner

'Pan American Day' in all the Republics of America and which should be established as a commemorative symbol of the sovereignty of the American nations and the voluntary union of all in one continental community;

"Whereas, April 14th is the date on which the resolution creating the Pan American Union was adopted;

"The Governing Board of the Pan American Union

Resolves:

"To recommend that the Governments, members of the Pan American Union, designate April 14th as 'Pan American Day' and that the national flags be displayed on that date."

Now, therefore, I, Herbert Hoover, President of the United States of America, in order to give effect to the resolution adopted by the Governing Board of the Pan American Union, do hereby proclaim April 14th as "Pan American Day," and do hereby order that the flag of the United States be displayed on all Government buildings on that date, and do invite the schools, civic associations, and people of the United States generally to observe the day with appropriate ceremonies, thereby giving expression to the spirit of continental solidarity and to the sentiments of cordiality and friendly feeling which the Government and people of the United States entertain toward the peoples and Governments of the other Republics of the American Continent.

In witness whereof, I have hereunto set my hand and caused the seal of the United States to be affixed.

Done at the City of Washington this 28th day of May, in the year of our Lord nineteen hundred and thirty, and of the Independence of the United States (Seal) of America the one hundred and fifty-fourth.

HERBERT HOOVER.

H. L. Stimson,
Secretary of State.

Good Food for Little Money to Protect the Health of Children; by Lucy H. Gillett

A handy guide to the wise and economical selection of foods for the family.

Lists those foods that will protect health, build sound bodies, and develop resistance to disease.

Suggests a week's food orders for families of various sizes.

This leaflet is obtainable at the following prices, which include postage:

1 to 3 copies	$ .03 each
4 to 9 "	.01 "
10 to 24 "	.008 "
25 to 99 "	.007 "
100 copies	.50
500 copies	2.25

1,000 to 5,000 copies cost $3.50 per thousand, f.o.b. New York. Larger quantity prices on request.

PUBLISHED BY THE AMERICAN CHILD HEALTH ASSOCIATION, 450 SEVENTH AVENUE, NEW YORK CITY

Publications of the First National Survey of High Schools

Titles and prices of 28 monographs reporting findings of the National Survey of Secondary Education have been announced by the Federal Office of Education. Orders may be placed with the Superintendent of Documents, Government Printing Office, Washington, D. C., specifying Office of Education, Bulletin 1932 No. 17, together with monograph numbers. Each monograph is bound separately. There is no provision for issuance of survey findings in one complete volume. The complete set of 28 monographs costing $3.80 may be ordered, however, and monographs will be mailed as they come from the press. (Enclose check or money order with order.)

The list (with prices) is as follows:

Monograph No.

1—Summary. 15c.
2—The Horizontal Organization of Secondary Education — A Comparison of Comprehensive and Specialized Schools. 20c.
3—Part-Time Secondary Schools. 10c.
4—The Secondary-School Population. 10c.
5—The Reorganization of Secondary Education. 40c.
6—The Smaller Secondary Schools. 15c.
7—Secondary Education for Negroes. 10c.
8—District Organization and Secondary Education. 15c.
9—Legal and Regulatory Provisions Affecting Secondary Education. 10c.
10—Articulation of High School and College. 10c.
11—Administration and Supervision. 15c.
12—Selection and Appointment of Teachers. 10c.
13—Provisions for Individual Differences, Markings, and Promotion. 40c.
14—Programs of Guidance. 10c.
15—Research in Secondary Schools. 10c.
16—Interpreting the Secondary School to the Public. 10c.
17—The Secondary-School Library. 10c.
18—Procedures in Curriculm Making. 10c.
19—The Program of Studies. 15c.
20—Instruction in English. 10c.
21—Instruction in the Social Subjects. 10c.
22—Instruction in Science. 10c.
23—Instruction in Mathematics. 10c.
24—Instruction in Foreign Languages. 10c.
25—Instruction in Music and Art. 10c.
26—Non-Athletic Extracurriculum Activities. 15c.
27—Intramural and Interscholastic Athletics. 10c.
28—Health and Physical Education. 10c.

Announcements giving time of issuance of the various monographs will appear from month to month in *School Life*, official journal of the Federal Office of Education.

REVIEWS

An Introduction to the History of the Social Sciences

By Henry Johnson. Charles Scribner's Sons.

The small volume under consideration is the second of a series which the Commission on the Social Studies in the Schools is publishing. It is really a brief review of the history of the *teaching* of the social studies, an "exploratory survey," which the author expects to amplify at some future date. The teacher and the curriculum maker will find the three closing chapters most useful, for it is in them that Professor Johnson offers challenging material of present-day interest. The rest of the book develops the thesis that many supposedly new principles and new discoveries are really "re-discoveries," that some of them go back to dim antiquity, and that what we have done is to dress up these ideas and to give them fancy names.

It is quite apparent, says the author, that history written even in ancient times and in the Middle Ages recognized the idea of a changing world, used the past to interpret contemporaneous events and emphasized the need of searching the past for its lessons and precepts. Didactic history was especially prominent in the Middle Ages, though it also appears frequently among writers of early modern times; for example, in the works of such 16th century thinkers as Luthers and Vives, the Spanish humanist, both of whom were interested in the moral influence of history. Still another characteristic that developed was intense patriotism. But Professor Johnson goes on to show that exaggerated nationalism in history writing was a trait which continued down to our own day. In fact, he quotes the introduction to a text-book published in Boston in 1898 which asked the question, "Why are Americans the bravest men and the most successful inventors, explorers, authors and scientists? In short, why is the United States the greatest nation in history?" There is ample evidence, then, that writers of early modern times, like writers of a much later day, were scrupulous in the selection of material which suited their own purpose, be that the inculcation of moral precepts, patriotism or anything else.

The 16th century was distinctive in the sense that for the first time actual history text-books appeared, that history assumed definitely a place in the school curriculum, and that it was taught by special teachers. Visual aids were now being introduced, and what we call the cultivation of desirable attitudes took on a definite aim. Yet it was another century before the study of history was required in the schools.

In the subsequent chapters, Professor Johnson sketches the contributions of a number of men to the evolution of history teaching, all of them advocating ideas which seem as if they had been expressed on this very day. Comenius, for example, favored the study of history right through the university, preferred arrangement by "units" and argued for the necessity of more social history. Weise is particularly modern, for he advocates map studies, drill work, contemporary history, the use of newspapers, improvement in the art of questioning, the use of the "regressive method" and well-prepared teachers. Rousseau emphasized the study of geography and biography for young people, would have them learn what was useful and would let them draw their own conclusions. While he felt that there was more of evil, prejudice and illusion than was good for Emile, nevertheless he saw in history an opportunity to study the "human heart." The many-sided Priestley prepared syllabi which contained a pretty thorough treatment of the history of civilization. In his scheme, history would be taught to develop "the able statesman and the intelligent and useful citizen." He advocated much pupil activity and frank classroom discussion on controversial issues. The eccentric and revolutionary Basedow strove to cultivate the historical sense and what we now call "world-mindedness." He, too, used the "regressive method." His disciples offered an approach to the culture-epoch theory and advocated the study of the immediate community for young children. Perhaps we are not accustomed to thinking of Frederick the Great as something of a landmark in the history of history teaching. Nevertheless, he appears to have made some highly significant contributions. He favored history not only because of its moral lessons, but because of the broad vision that might be gained by studying it. Tell the truth, he said, stress the important, pay more attention to events of your own time. In Carl Muller, Professor Johnson discovers a valuable kinsman. Muller was an enthusiast over the mission and the value of his subject. He favored the study of history to meet current needs and proposed a whole course with appropriately fitting parts. In his concept of history as the story of humanity as a whole, and in his plea for correlation with other subjects, this early 19th century writer does appear, indeed, strangely modern.

Three great movements, pertinent to the problems of our own day, are then taken up by the author. First is the problem of the relationship between history and other subjects. The author shows that while some kind of fusion has always received serious consideration, nevertheless, difference has arisen over the subject which should constitute the core, so to speak. Largely because of the influence of Herbart, or, more appropriately, Herbart's disciples, we in the United States have experimented more or less successfully with correlation. Sometimes this correlation, whether between history and the other social studies or between the social

Scanned with CamScanner

studies and other subjects of the curriculum, has proved to be an excursion into the ridiculous. More recently emphasis has been placed not so much on the subject as the core, but rather on what the author calls "group correlation." Thus arose the "social" studies. But, the author points out, remarkable as has been the progress in correlation, the movement for fusion (that is, for the disappearance of separate social studies) has made little headway in this country.

A second consideration of timely interest is that which concerns *what* should be taught. Professor Johnson shows that an examination of textbooks and syllabi reveals unmistakable tendencies to teach what fits the particular time or place, the particular social group, or "pressure group," aye, even the particular pupil. This strained effort has led to the perversion of history teaching into propaganda and sometimes into deliberate falsification. The author sounds a dismal note as he observes the dissention wrought over the question of *what* to teach. "The general result is that history has become, to a degree new in the United States, a controversial subject. We have been rapidly moving in that direction since about 1918, and if we go on may produce a condition that will force history out of the public school's curriculum, and relegate it to the domain to which religion has already been relegated."

Finally, the author examines the extent which contemporary history has been emphasized. Despite the attention given to recent and current problems by older writers, as we have seen, interest in contemporary history is rather a late development both in Europe and in America. Probably the greatest progress in the matter of teaching current problems has been made in this country. This is undoubtedly due to the feeling that the pupil should know thoroughly the world in which he lives, and that the past should be taught as the basis for understanding the needs of our own time. Pedagogically, the increasing popularity of the "regressive," topical treatment is evidence of this type of orientation. But in Europe the study of recent history has been affected by strongly nationalistic considerations, for some countries are more eager to emphasize a pride in the past; while others (like Russia and Italy) choose to part with the past and stress movements and ideals which have developed since the war.

Teachers of history would do well to acquaint themselves with the implications regarding the extent of correlation, the choice of the subject matter and, in general, the question of teaching for "present needs," which Professor Johnson discusses in his concluding chapters. Certainly, the movement to revise the syllabus in American history in the high schools of this city can gain much by a careful consideration of the dangers against which the author warns.

LUCIAN LAMM,
Chairman, History Department.
Franklin K. Lane High School.

Education and the Modern World

By Bertrand Russell. W. W. Norton.

In "Education and the Modern World," Bertrand Russell is occupied with the deeper social and individual implications of education for adult life. Though education in its larger sense is not very closely linked with mathematical physics and theoretical science, Russell's métier, he nevertheless brings to his subject a mind to which, in the truly Terentian sense, nothing human is alien. Pedagogically, Russell is no mere dilettante—for his own school in England has attracted more than local attention and applause.

The *leit-motif* which runs through this work is simply this: Shall education train citizens or shall it train complete, full, harmoniously developed individuals? To Russell, this presents an almost insoluble difficulty. For it is his contention that education, as organized today, places a greater emphasis on social rather than on personal virtues. He grants that this must be so, since our civilization is so intricately interdependent that a lack of social solidarity would inevitably lead to anarchy. The individual is first a social creature, and then a unique entity. This much is incontrovertible. But there is the danger, Russell points out, that the State, in moulding a social-minded citizenry, may stifle certain very valuable traits whose significance is not entirely social. Russell reluctantly reconciles himself to the fact that a sense of vivid world-citizenship has a vaster import than the "sense of glory" with which the fully-developed ego invests its owner. With a nostalgic sigh and a wistful look backward at the Titans of yesterday, he remarks that, ". . . the education of the individual is to my mind a finer thing than the education of the citizen; but, considered politically, and in relation to the needs of the time, the education of the citizen must, I fear, take the first place."

Throughout the book, the individual is conceived of as a battleground of external forces wrestling for the possession of this soul. The State, the church, the herd, each want him for their own. And so from birth to death, he is a prize for which all with with any special interest to serve seek avidly to capture and by means not always scrupulously immaculate. How is Everyman to appease all these factions and yet retain his intellectual and emotional identity, his "me-ness"? That is the crucial question which Russell raises, but does not answer. From out of these chapters on types of education, on sex, patriotism, religion, propaganda, economics, class-feeling in education, there emerges no clear course. The analyses are trenchant, deep, and basic. The brutal contradictions inherent in our social, political and economic systems are laid bare, quivering hot and repulsive under the cold, unerring scalpel of Russell's mordant observations. But, enough, enough of this! Is there no Balm in Gilead, no emollient to

Scanned with CamScanner

soothe the seared tissues of a groaning civilization? Just this, says Russell, in a truculent peroration which ends on a note of vague and dubious optimism: "Our world is a mad world. Ever since 1914, it has ceased to be constructive because men will not follow their intelligence in creating international coöperation, but persist in retaining the division of mankind into hostile roups. . . . The source of all this does not lie in the external world. . . . It lies in our passions; it lies in our emotional habits; it lies in the sentiments instilled in youth, and the phobias created in infancy. The cure for our problem is to make men sane, and to make men sane, they must be educated sanely. . . . Can it be wondered at that a world in which the forces of the State are devoted to producing in the young insanity, stupidity, readiness for homicide, economic injustice, and ruthlessness—can it be wondered at, I say, that such a world is not a happy one? . . . Our age is so painful that many of the best men have been seized with despair. But there is no rational ground for despair: the means of happiness for the human race exist, and it is only necessary that the human race should choose to use them."

Those who look to Russell for a definite program to get us out of the Slough of Despond will be disappointed. He has none to offer. Only the querulous will quibble at Russell's findings. They are indisputable. They are known to us. But emotional excitation, intellectual stimulation provide no basis on which to build a newer, better, more finely integrated educational system. There is need for definiteness, specificity in our educational aims and policies. Despite his contemporary relevance, his indubitably profound grasp of education in all its ramifications, Russell still has about him the exasperating elusiveness of the Utopian. Where the situation demands immediate means and ends, he points to a feasible, but all-too-distant prospect.

While he does not soothe our spirits in travail, Russell must be read by all who are interested in the current education scene. His philosophic detachment, his impartial dealing where partisanship is rife, his pellucid style, his rare and brilliant wit, are qualities all too rare in the pedagogical forum today. He is no facile server of panaceas. His is a germinal mind, pregnant with many vital suggestions for the clear-seeing, practical-headed educator.

Manual Training High School.

The Theory of Education in the United States

By Albert Jay Nock. Harcourt, Brace and Company, 1932.

This book contains a series of lectures given by the author at the University of Virginia in 1931. I shall first present a brief outline of these lectures, and then give a critical evaluation of some of the ideas therein developed.

Some thirty-five years ago a revolution occurred in the theory and practice of education in this country. Prior to that time a small select group received a secondary school education, and a very much smaller group went to college. The course then was dominated by the study of Latin, Greek, and Mathematics. Education was formative and disciplinary. It was the age of the "Great Tradition."

But suddenly there came a swift change. Our secondary schools, colleges, and universities opened their doors to almost all comers, and in order to retain this horde of poorly prepared and mentally inferior students, our educational administrators were forced to abandon Latin, Greek, and Mathematics, and to replace these disciplinary studies with all sorts of vocational courses, English courses, and diluted sciences. Standards had to be steadily lowered, courses of study incessantly tinkered with, and methods of teaching changed only to be changed again and again. The burden of learning was placed on the teacher rather than on the student, and the teacher felt himself compelled to smooth the way for the lazy and incompetent and to give passing grades to many who were obvious failures. The product of such a system was a bitter disappointment to both the professional educator and the layman.

Such is the state of education in this country today, and such it must necessarily be, if we but examine the theories that underlie our educational procedure. These theories are: the idea of equality, the idea of democracy, and the idea that a literate citizenry will assure public order and honest government. All three ideas have sound philosophical bases, but all three have been popularly formulated and distorted so as to lead to false practices. The assumption that everybody is educable is popularly regarded as implicit in the doctrine of equality. Also "people accept as democratic what is merely indiscriminate. They have a strong resentment of superiority. They resent the thought that there are practicable ranges of intellectual and spiritual experience, achievement, and enjoyment which by nature are open to some and not all. We must aim at no ideals above those of the average man. The lowest common denominator of intelligence, taste, and character dominate. Hence the slogan 'we must give the people what they want,' not what they should want or might profitably want."

Mr. Nock's comment on the third theory is very caustic. He says: "The mere ability to read raises no very extravagant presumptions upon the person who has it. Surely everything depends upon what he reads, and upon the purpose that guides him in reading it. . . . Consider what our large literate population reads—the colossal and unconscionable volume of garbage annually shot upon the public from the presses of the country, largely in the form of newspapers and periodicals . . . any expectations put upon the saving grace of literacy are illusory."

We know, as a matter of course, that only very few people are educa-

Scanned with CamScanner

ble; but nearly all can be instructed and trained. There is a vast difference between education and instruction. Hence, if we realize that what we are doing is training and not educating, we would not be disappointed in the results. Indeed, this type of instruction and training should be extended to include many more of the uneducables. But we must not expect to gather grapes from thorns. As a matter of fact, considering the material, our educational system in this country is doing a pretty good job.

We must, however, realize that our colleges and universities have no right to be called such. They are chiefly engaged in training motor-minded persons in vocational pursuits. A list of the subjects that are counted toward a bachelor's degree at Columbia would amaze anyone educated in some of the continental countries. Here are some of them: writing of advertising copy, practical poultry-raising, business English, elementary stenography, newspaper practice, feature writing, wrestling and self-defense, the fundamental processes of cookery, fundamental problems in clothing, family meals, food etiquette and hospitality, principles of home laundering, gymnastics and dancing (including clog-dancing). Truly bargain-counter education.

Unfortunately, while concentrating our attention on the uneducable we are neglecting the very small group that is educable. The abilities of this latter group largely go to waste, and there is no college in the country where our finest minds can receive an education.

How different is the educational situation in Europe! There educational administrators are not hampered by any false theories of pseudo-equality and pseudo-democracy, and hence they give their students an education that is really formative and disciplinary. Only those who show ability to do clear, sustained, and hard thinking are allowed to go to secondary school and college.

This, in brief, is what Mr. Nock has to say about education in this country. He says it tersely, forcefully, and beautifully. There is a challenge on almost every page. But one puts down the book with a feeling of regret and irritation that such a fine, clear-cut analysis should lead to a conclusion of futility and despair. He despairs because in this country the day of the "Great Tradition" is gone, never to return.

That he has correctly diagnosed the educational situation no informed person can question. The distinction he makes between instruction and education is sound. The theories underlying our educational practices have never before been so clearly exposed. The recognition of the existence of a vast horde of uneducables who can only be vocationally trained bears out what every experienced teacher knows. But that one must study Latin and Greek to obtain an education that is formative and disciplinary, is certainly debatable. The sciences, mathematics, modern foreign languages, history, sociology, economics, psychology, and philosophy (all of these undiluted) afford ample opportunity for clear, sound, sustained, mature, and profound thinking.

When he says that there is not a single college or university in the country today where one can obtain a real education, he simply asserts what is not so. True, there are many courses of a trifling and pseudo-educational character, but at any one of our first-rate universities it is possible to do work of a very high order in any of the subjects enumerated above. I am told that even the author's *sine qua non* of education—classical languages and literatures—may be intensively studied there.

One final thought. He laments the passing of the "Great Tradition." He will admit that in the past our leaders in government and in big affairs, both here and abroad, were brought up in the "Great Tradition." Has their leadership promoted the happiness of the mass of mankind? Has it not rather led to crushing exploitation, widespread misery, and the wholesale butchery of organized war? We cannot possibly make a worse mess than was made for us during the many centuries that were dominated by the "Great Tradition."

BY WAY of summary, the depression has brought about a condition of unrest and chaos in our national and individual lives. Its effects have been felt by every institution because of lasting and permanent changes that have occurred. These changes preclude any hope that we might entertain of returning to any previous set of ideals, objectives, or conditions. Retrenchment or reversal of form is therefore impracticable. It is necessary to reconstruct our institutions to meet a life which has seen a phenomenal change in the last decade and which will have even a more rapid change in the years to come.

In order to meet the adjustment successfully, it is necessary to co-ordinate the efforts of all our institutions toward an integrated life that will give individuals the best opportunities for growth and development. The proposal that is suggested is the development of the national conference plan for the development of an integrated program. This planning will be effected as a result of the determination by prediction of what American life in its respective phases will become. It will be the task of education so to construct its system of training that children will not only live most efficiently here and now, but that their personalities will be integrated so as best to meet the conditions of life that they are likely to find in a few years to come.

DOUGLAS B. MILLER

THE CHALLENGE OF JUVENILE DELINQUENCY *

JAMES TRUSLOW ADAMS in "The Epic of America," gives beautiful expression to the American dream —"that dream of a land in which life should be better and richer and fuller for every man, with opportunity for each according to his ability or achievement. A dream of a social order in which each man and each woman shall be able to attain to the fullest stature of which they are innately capable, and be recognized by others for what they are, regardless of fortuitous circumstances of birth or position."

With complete knowledge and a thorough understanding of the trials, the tribulations, the struggles, the hardships and the achievements of the pioneers on the successive expanding frontiers of our nation, and with a deep insight into the dynamic causes of the various conflicts through which our young nation had to pass in the process of political, economic, social, educational and spiritual adjustment to achieve a position of leadership among the nations of the world, James Truslow Adams, author of "The Epic" keeps full faith in the common man. Adams rises to higher and higher levels of democratic idealism where, with prophetic vision, he sees the promised land of the American dream.

Will the American dream come true? Will democracy save itself? Will men, women and children learn, acquire, cherish and use those values of life which create and develop a richer and fuller life for all? Will the citizenry of America be privileged to enter this blessed land of promise on earth, where all will work cheerfully together, each giving the best of himself for the good of all; where competitive struggle for position, wealth or power will cease, where individual and social strife to build merely bigger and bigger than before will disappear, and where coöperative service to build better and better on the solid foundation of finer qualitative and abiding values of life will be the greatest motivating power for individual and social action?

EDUCATION MUST BE WIDENED, DEEPENED

To a very large degree the answer to these questions will depend upon our educational vision, our educational philosophy, and our educational practice. We must add length, breadth, depth and height to our educational structure. Education must be lengthened beyond the school years of the child, *i.e.*, education and life should be coterminous. Education must be widened to embrace more and more recreational, social and civic activities so that all children and adults in our society may be profitably engaged during their leisure hours. Education must be deepened so that the finer fundamental qualities and potentiali-

* This article appeared in the November, 1932, issue of *The Principal*.

Scanned with CamScanner

ties of each individual may be reached, understood and then wholesomely developed for the greatest good of both the individual and society. And finally, education must hold her torch of enlightenment high enough to illumine clearly the highest ideals of a genuine democracy, and those abiding spiritual values of life which should guide all human beings.

Juvenile delinquency is only one of the end results of the individual's maladjustment to the many demands made upon him by various complex human relationships and codes in modern society. The causes of individual and social maladjustment have been studied by many scientists in the fields of sociology, psychology, physiology, biology, anthropology, criminology, neurology, psychiatry and education as well as by social workers and religious leaders. As a result of these numerous studies and investigations, conclusions have been drawn that some of the causes of maladjustment are to be found within the individual himself, *e.g.*, physical or organic deficiency and disease, glandular disfunction, intellectual inferiority, feelings of insecurity, emotional instability due to infantile fixations or frustrations, unsatisfied cravings for attention and love, early conditioned reflexes or responses, compensations, etc., volitional inefficiency, social inadequacy, lack of moral tonicity, vigor or power, loss of religious comfort, consolidation, peace, inspiration, and guidance, and numerous functional disorders of the psychobiological human organism. Other causes of maladjustment are to be found in the total environment which surrounds the individual, *e.g.*, lack of wholesome, cultural, social and recreational opportunities in the community, lack of stimulating and attractive environment in the home (the broken home, constant conflicts and quarrels in the home, destructive influences of delinquent parents in the home, and the like) and the unfortunate disintegrating influences of various social, economic and political evils which surround the child in the community in which he lives. Another set of causes of maladjustment may be traced definitely to the associations, the reactions and reciprocal relationships of the total individual to his total past and present environment, *e.g.*, parent-child relationship, sibling relationships, child and child relationships or companionships at school, on the street and elsewhere, teacher-child relationships, child-adult relationships both in the past and present, and the entire child's relationships and reactions and conditions to past and present situations.

We have, therefore, become duly impressed with the fact that the causes of the individual's maladjustment may be so varied, numerous and complex that it is impossible to give effective treatment to any maladjusted individual or to prevent disintegration of human personalities or anti-social behavior, unless we can clearly diagnose the underlying causes behind the symptomatic behavior of the individual and then secure the coöperation of the individual himself, his family, his church, his teachers and all other constructive resources of community agencies for either the cure or the prevention of anti-social tendencies or overt anti-social acts of the maladjusted or disintegrated individual.

While it is perfectly true that without a complete understanding of the underlying causes of maladjustment and without the fullest coöperation of all the personalities and agencies that influence the child, valuable results in the prevention, treatment, or cure of problems of maladjustment are difficult to obtain, still it must be clear that nothing of value will be accomplished if each person or each agency that influences the child's personality growth and integration, constantly shifts the responsibility for the wholesome development of the child from one agency to another, or fails to act constructively until all other influential forces are combined.

Juvenile Delinquency Challenges Society

Juvenile delinquency challenges the best thought of the entire community. Parents, teachers, social workers, civic and religious leaders, specialists in the field of mental hygiene and related fields of human personality study, must work together and give the best of themselves to conquer the entire kingdom of individual and social evils. The true prevention of juvenile delinquency also challenges every condition and institution in society. The school, therefore, cannot accept the entire responsibility for the solution of all personality problems presented by different children, nor indeed should it take away the fair responsibility of the home, the church, and society for the best development of the individual.

Educators welcome the constructive contributions made by all those who have given the best of themselves to the study of human relationships and human problems. Educators eagerly seek the coöperation of all those who are interested in preventing the disintegration of human personalities, and in the reduction of individual and social failures. But the schools in our land have definite duties and responsibilities of their own for developing each child's personality as well as for the education of his body and mind, for developing the child's emotional habits as well as for his mental accomplishments, manual performances and skills, and his vocational preparation. The school is quite as responsible for formation as for information. It is to these responsible tasks and specific duties and obligations of our schools that attention is now directed.

Democratic Principles in Education

The aims and cardinal objectives of education have been stated in various ways by leading educators in this and other countries of the world. These are well known to all students of the history of education. It should be self-evident, however, that in America we must emphasize democratic aims, democratic values, and democratic ideals so that children and adults may day by day learn to know

Scanned with CamScanner

and to cherish those principles which must guide them in their present mode of living, and which will prepare them to live efficiently and in harmonious social relationships with other men in a democratic society.

Long ago, we accepted those fundamental democratic principles of equality and of the rights of individuals to life, liberty and the pursuit of happiness. But in accepting these principles have we taught the real meaning, the rich content, and the abiding values underlying these democratic ideals?

Equality in a democracy means equality of opportunity for all, and the very essence of equality of opportunity is found in giving unequal treatment to unequal talents, abilities and capacities.

"The old democratic ideal was based on the childlike idea of the equality of all men. The new conception of the democratic ideal is based on the psychological fact of profound individual differences." (Dr. William H. Burnham.)

Opportunities granted to each child and adult according to his needs, his abilities, his capacities, his limitations constitute one of the great dramatic ideals towards which modern education in America is progressing. Through the persistent and enlightened effort of educational and socially minded leaders, great forward steps have been taken in America away from old traditional forms of mass instruction and mass treatment of individuals with their resultant dehumanizing uniformity, to the new and better modes of individualized instruction and treatment of individuals by offering differentiated types of work in our schools to suit the needs of individual children, and to develop the creative initiative and the best potentialities of each child for more efficient individual and social usefulness.

"Life, Liberty and the Pursuit of Happiness"

The inalienable right to life in a democracy means the right to live on that higher level of society which guarantees to every child those standards of life which have now been incorporated in the "Children's Charter" and adopted unanimously at the White House Conference on Child Health and Protection in 1930. These standards should become familiar to all educators, parents and community leaders in America so that educational and social progress in America may be made along the lines indicated in the Child's Magna Charta.

The right to liberty in a democracy means freedom of thought, freedom of speech and freedom of action within safe and sane constitutional and legal bounds, in other words liberty without that license which interferes with the rights of other citizens in society. Individual rights imply reciprocal duties and obligations towards others with whom we must cooperate cheerfully to live harmoniously and efficiently for the good of all. Individual rights cannot be guaranteed to any individual by society unless the individual is ready to assume those social and civic duties and

obligations which make it possible for a democratic society to save itself and to progress to its higher and better destiny.

The right to the pursuit of happiness in a democracy means the right not only to the pursuit but also to the actual achievement of happiness. This right guarantees to each individual in a democracy, the joy of living an abundant and well-rounded life, the joy of growing to the fullest stature of which the individual is innately capable, the joy of service, the joy that comes from living harmoniously not only within the family group but also outside of the family circle with friends, neighbors, and all other human beings, the joy that results from feelings of adequacy and security, the joy of accomplishing worthwhile tasks, the joy of appreciating the good, the true and the beautiful in life, and finally the joy that comes through the attainment of good physical and mental health which are the sole guarantees of well-balanced, socially efficient and spiritually integrated personalities.

Tested in the light of modern mental hygiene, these democratic principles are not only the safest guides for each individual's health, happiness, efficiency and normal life, but they are socially sound. If we accept these simple but far reaching statements as the most desirable fundamental principles of democracy and mental hygiene, then we must be ready to adopt practical means for the gradual attainment of these ideals in all the educational systems in our land. We must have full faith in the abiding values of these principles and their fullest implications, we must organize our educational work in such a way that our school organizations, our curricula, our methods, our daily practice and all our extra-curricula activities, shall constantly reflect the spirit and the ideals of our ever expanding and wiser interpretation of the essential principles of a progressive and health democracy.

Juvenile delinquency and many other individual and social evils will be greatly reduced when the schools throughout the land actually carry into practice those basic principles which form the arch on which a socially healthy democracy will securely rest.

How shall we give due emphasis to these principles and apply them in our daily educational practice to meet the challenge of juvenile delinquency?

Much has been done by our leading educators to enrich various courses of study in both elementary and secondary schools, to differentiate types of academic, commercial and industrial work for different types of children above the sixth year of the elementary school, to provide special classes and special schools for physically and mentally handicapped children and for children who present difficult problems of maladjustment. Within the financial allowance granted by various cities, education has been extended into summer schools, summer playgrounds, after school recreation and community centers, evening elementary and secondary schools, continua-

Scanned with CamScanner

tion schools, classes for adults and into the homes of home-bound, helpless crippled children. In addition, very beautiful new elementary and secondary academic, commercial and industrial schools have been built and equipped during the past decade.

Our methods of instruction have also improved, and we recognize today the need of placing more and more emphasis on the child's methods of learning rather than on methods of teaching, and on the fullest development of the whole child rather than upon certain limited scholastic achievements by the child. The rich contents of our courses of study are presented logically and psychologically. All progressive teachers watch not only the intellectual growth of each child, but also the emotional attitudes and volitional reactions of the child to the subject matter presented and to the real and dynamic situations which exist in the modern classroom. We know now that me must do much more than present cold facts to be memorized by the child and that we must create numerous opportunities for each child to initiate, to plan, to think, to judge, to apply and to concentrate on the work at hand so that he may exert his best effort because the work has real meaning and value for him. The child's work must be a real challenge to him, it must present a problem that is sufficiently attractive to him and within his abilities and powers to cause him to think, to enjoy, to judge and to exercise his will in the constructive and concentrative process of finding a satisfactory solution to the problem. Individual and social attitudes developed by the child and the child's reactions to these attitudes constitute the essentials of character formation. School subjects, school and extra-school activities, school methods and personal influences must be combined to develop character—the highest aim of the educational process.

Educational progress has been made, no matter what destructive critics may say to the contrary. We all know, however, that much remains to be done to meet the individual needs and capacities of millions of children who must attend school up to the legal chronological age limit set by various states in the Union. We have adopted compulsory education laws and we have opened the doors of educational opportunity to more and more children and adults in our land and for longer periods of time, but it has not been a simple task to meet the legal and educational demands of an ever-increasing school population. Owing to financial limitations, it will take a long time to provide all the necessary facilities and the trained personnel, so that the right type of individual instruction may be given to each individual in our schools. But in a dynamic and progressive democratic society, we shall always try to provide equal educational opportunities for different types of individuals in our society, and we shall always aim to provide adequate material, equipment and stimulating educational activities to develop the best individual, social and spiritual potentialities of as many individuals as possible.

Training for Leisure

Educators are generally agreed that the function of the school does not end with the close of the school day. If its aim is to influence the social outlook of its pupils, the school must concern itself in a large measure with the social life of the children. The school is interested in what the child does with its leisure hours, where the child plays and how, what its preferences are in companionship. The school is interested in these aspects of the child's life because the kind and character of a child's use of time after school hours affects behavior, its attitude toward authority and study and has an intimate relationship to retardation and truacy. As Warden Lawes of Sing Sing Prison says, "Furnish the opportunity for wholesome supervised recreation and groupings, and there will be less gangsterism and ultimately less delinquency and crime. Is not provision for this opportunity a proper responsibility for the school? Does it not merge with socialism in education? The sooner this view is more generally appreciated, the quicker and easier shall society be able to cope with incipient delinquency and criminality." The school may have to create new standards, broaden its scope and widen its influences. It may have to incorporate within its sphere all the agencies that have to do with social as well as scholastic attainments. But as the socially minded Warden continues to say, "The school will have the satisfaction of knowing that it is doing a great work in turning the tide of delinquency and criminality; that it is creating a new concept of life that must work for the greatest stability of the individual and the security of society."

The school stands as a representative of society in relation to the child. Since an important part of the process of growing up is to learn how to adjust to society, the school must undertake to furnish appropriate environment in which this adjustment can be learned.*

More Individualized Methods

To achieve better and better results in democratic education, we do need more and more manual and vocational work for all children, more and more supervised playgrounds, a still wider use of all school plants, more and more trained personnel, more and more individualized and socialized methods and projects. But we cannot afford to wait until all the necessary facilities, opportunities and varied types of educational, social and recreational activities have been provided in our ever expanding educational and closely allied social organizations. We can continue to revise, modify and enrich our courses of study and give more and more emphasis to the positive aspects of mental hygiene and to fundamental democratic principles. We can continue to

* White House Conference Reports on Child Health and Protection, 1930.

Scanned with CamScanner

improve our methods and techniques of individualized and socialized instruction, to make these basic principles of mental health and democracy more meaningful and of greater value to both children and adults. And above all, each school can be organized so as to reflect to an ever greater degree, a wholesome and stimulating democratic spirit everywhere and at all times. Such spirit will be felt by children, first, in their daily contacts with the wholesome democratic personalities of the principal, assistant principal and teachers who create the tone and spirit of the school, and secondly, through such individual and social practices as develop the type of character that motivates healthy individuals at all times and in all places, to right social action.

Measured in terms of educational achievement, the mastery of the essential content of subjects prescribed in the courses of study is important, the development of all the special abilities of individual children is necessary, the acquisition of skills in the use of the tools of art and science, and the preparation for a useful vocation in life, are very desirable, the increased power to appreciate the good, the true and the beautiful in life is of great value, but of all these achievements the development of right individual and social attitudes and wholesome reactions to human relationships and to various life situations is of supreme importance. Indeed, many leading educators, now agree, that the school's success should be measured solely in terms of the effectiveness, social adequacy and emotional maturity of the personalities of the children who have grown up in the school.

To develop right attitudes and reactions, the total individuality and personality of each child must be considered at all times. The modern democratic school realizes that its chief objective is not the teaching of subjects but the development of boys and girls for social life. With all that is being done by our schools to safeguard the physical health of children, it is even of greater importance that special attention be paid to the mental health of children as the factor most directly influencing personality.

As Dr. Stanley Davies states, "Mental hygiene should be introduced into every school through the principal and teacher. Second only to the home, the school should be a great mental hygiene force. In fact, it can be safely said that the school which neglects the mental health of its children fails in its greatest mission."

Good mental hygiene demands that all the influential factors of the school must be employed so that the democratic rights of each individual child will be respected and his reciprocal duties and obligations to others will be taught and emphasized. Good mental hygiene also demands that every child be considered a potential asset to the community, and the good qualities of the child must be discovered and developed to their maximum potentialities to the end that the entire personality of the child may become well adjusted and wholesomely integrated.

Of all the permanent influences or factors for good which a democratic school may exert on each individual child, none can compare with the spiritual influences of the fine personalities of superintendents, principals, assistant principals, supervisors and teachers who come in daily contact with children. These personalities create the tone and spirit of the entire educational system and of the school, and it is chiefly through these personalities that due emphasis is given to both the democratic and the hygienic aims of education.

The Principal

The principal is the educational leader, the executive and administrative head of his school.

He is the wise counselor and friend of teachers, children and of parents of children who attend his school. The principal can, therefore, influence the teachers, and directly and indirectly the children and their parents. The principal is, therefore, in a position to help families to understand the great lessons of democracy and to guide them in carrying over these lessons into daily practice and relationships in their homes. The democratic principal is also interested in all constructive agencies in his community, and thus becomes a powerful influential democratic force in the city, helping to stimulate and to develop an educated public conscience for the good of all children and adults in the community. It is the principal who leads in the educational progress of his teachers, and both he and his assistants not only help to improve the teachers' methods of teaching subjects, but assist in developing those right attitudes of teachers toward their children which enable them to give the best of themselves to the total personality of each child under their friendly and stimulating guidance and influence. The democratic principal confers frequently with his assistants and teachers, and advice and suggestions are unhesitatingly given and interchanged for the benefit of the children in the school. The democratic principal selects carefully committees of teachers to organize, direct and supervise various activities in the school so that the responsibility is democratically shared by all for the good of all. In other words, the example set by the dynamic and wholesome personality of a democratic principal will do more than any other single factor to create a wholesome democratic school spirit which will be reflected in every classroom of his school, and in the lives of the teachers and children in his school.

Schools organized on a wholesome democratic basis and giving due emphasis to the mental health of all teachers and children, find that the positive healthy and happy coöperative atmosphere established in these schools serves in a great measure to solve many problems of behavior presented by different types of maladjusted children. Such schools become attractive to all children. It becomes unnecessary to force any child to attend regularly the school or the class where the atmosphere is congenial to him,

Scanned with CamScanner

where the opportunity is given to each child to succeed, where individual help is given to each child to overcome difficulties which are not beyond his abilities to surmount, where wholesome, well-balanced and integrated personalities are met and where teachers, assistant principals and principal inspire confidence, respect, admiration and love in each child because of their sincere attempts to understand and to guide each child with patience, sympathy, insight, kindness and love. "The essential principle of education is not teaching subjects; it is love." (Pestalozzi)

"There are in the schools of America, a host of educational leaders and skilled teachers who have kept alive in their hearts the real spirit of eternal youth. They have the art of dealing sympathetically and intelligently with the hopes, ambitions, burning ideals, bitter disappointments of real children. They are past masters of the art of stimulating, guiding and disciplining the feelings, the thought and the actions of children in various grades. They understand, love, and perhaps most important of all, have supreme faith in children." (Henry C. Frick, Educational Commission School Betterment Studies, Vol. 3, No. 2, p. 55.)

The New Mental Hygiene

To assist principals and teachers in democratic schools in the further reduction and solution of difficult individual problems of behavior, the new mental hygiene has a definite contribution to make to public education in opening its eyes to a great opportunity to understand the personality problems of school children, and to help in altering the conditions that breed destructive habits while a child is young. Dr. William H. Burnham, Professor of Education in Clark University, makes this very significant statement: "The longer one studies the subject of education and the more one considers the practical needs of teachers, the more one feels that one subject more helpful to them than any other in the professional field is mental hygiene, not only for the contribution it makes to the teacher's own health, but also for the vast benefits its teachings give for the health of children. The advantages of mental hygiene for the teachers and for children can hardly be emphasized too strongly."

Many of the causes leading to individual and social maladjustment are now definitely known. More and more permanent cures of mental disorders and mental diseases are now effected through the careful diagnosis of these underlying causes, by specialists in the field of clinical psychology, psychiatry, neurology and mental hygiene, and through the unified coöperative scientific and artistic treatment of maladjusted individuals by teachers, parents, social workers and specialists. But more important than the diagnosis and cure of unbalanced or disintegrated personalities, is the constructive program which is now being organized and applied for the prevention of future mental and nervous disorders.

Not until the opening years of the twentieth century was the preventive note sounded. In earlier periods only the most obvious mental disorders were recognized and attempts made to cure these. There was no extension of mental hygiene concepts to every day problems, and little attention paid to the possibilities of prevention. But as the roots of many maladjustments were traced further and further back into childhood, it became clear that most work with adolescents and adults could only be remedial, and that true prevention must begin earlier, when habits and reaction patterns were being formed, often undesirably and with some grave implications for the future.

The plasticity of the human organisms during childhood makes possible not only the inculcation of desirable character traits, but also the modification of undesirable traits already established. Childhood has been aptly termed the golden period for mental hygiene. (Mental Hygiene Bulletin, January, 1931.)

Mental Hygiene in School Program

Any knowledge which the educator may be able to receive from scientific research in mental hygiene or from any other field dealing with the study of human personality and the relationships of the total personality to other human beings and to life situations, should be incorporated in all school programs and in all progressive methods of education because the school which neglects the mental health of its children fails in its greatest mission.

With such additional knowledge of mental hygiene and with the professional guidance and assistance given by specialists in this field, teachers will gain a better understanding of the causes that underlie symptomatic behavior. With deeper and clearer insight into problems of human relationships and with more objective attitudes towards the individual child who presents simple or more difficult problems of maladjustment, great gains will be made in helping children to develop wholesome personalities and in preventing future and more aggravated conflicts and disorders which lead to partial or total disintegration of personality or to anti-social behavior.

To assist our schools in achieving these results, the Bureau of Child Guidance of the Board of Education of the City of New York was established on June 1, 1931. As an integral part of our educational system, the Bureau of Child Guidance is now organized to work in closest coöperation with superintendents, directors, principals and teachers in our public schools to assist children in conquering undesirable character and personality traits, in strengthening desirable individual qualities, in developing right individual and social habits, attitudes and reactions, and in raising the total personality of each child to higher and higher levels of integration and social efficiency.

At the Third International Congress of Eugenics held in New York on August 22, 1932, the positive statement was made that: "The number

Scanned with CamScanner

of socially inadequate people in the United States is appalling, that one out of every one hundred and sixty people in the United States during the year 1930 was a patient in an institution for nervous or mental disorders, and that from present indications we will have more than 500,000 people in nervous and mental institutions in 1934. Mental disease is widespread in the United States."

Juvenile Delinquency and Crime

In addition to this appalling fact our crime commissions are discovering that a large part of crime is committed by a relatively small proportion of criminals who are repeated offenders. These repeated offenders were for the most part known as recidivists in adolescence by the juvenile court. The majority of them were considered problems in school. Furthermore, the great majority of maladjusted adults who fill the beds in our psychopathic hospitals were recognized as unstable or "different" personalities in adolescence and their histories reveal a succession of difficulties of adjustment extending back to early childhood. In other words, the great majority of maladjusted adults presented difficult problems in childhood.

For three years the sub-commission on causes of the New York State Crime Commission delved into the factors associated with juvenile delinquency. As a result of their studies, this commission made the following definite recommendations: (1) Mental Hygiene and psychological treatment for the prevention of juvenile delinquency are to be given strong support, (2) School behavior clinics should be established, (3) A course in behavior problems of school children should be embodied in the teachers' curriculum, (4) The school curriculum should give more emphasis to the mechanical aptitudes of children wherever they exist, (5) Purely punitive methods in attempting correction of delinquency behavior should cease, (6) Incipient behavior disorders should be treated as early as possible, and (7) A coördination of delinquency prevention efforts among all agencies is absolutely necessary.

From the statements, findings, conclusions and recommendations made by leading authorities, it is clear that we must attack the serious problems of individual and social maladjustment and of nervous and mental disorders which lead to juvenile delinquency with a positive educational, clinical and social program which will endeavor not only to cure those children who show incipient and significant signs of maladjustment, but which will prevent the development of nervous disorders, mental diseases and social delinquencies.

The place to begin is with the child. "The important points to remember in beginning are first, that normal, modern children have been abundantly shown to be sound and wholesome in their impulses, prime emotions, feeling, thought and action, responding to proper stimuli with a readiness which is all that could be desired. The problem is to place before them a progressive series of ideals, each of the right kind, at the right time, in the right manner." (Pamphlet on "Emotion," School and Betterment Series.)

Educators are prepared to join forces with all intelligent groups that are directly or indirectly concerned with the spiritual guidance of human beings. Educators realize fully that the more unified, the better related, and the better integrated all constructive influences and spiritual forces become, the more valuable and the more permanent will the results be both for the individual and for society. But the Educator also sees his own unique part in the battle against existing individual and social evils, and in the progressive, democratic movement for the improvement of both the individual and society.

The spirit of democracy in principle and practice with all its implications and wholesome satisfactions, supplemented by those positive aspects of mental hygiene which help to develop wholesome personalities, can be created and developed in all of our schools. The right spirit will conquer all evils. The cultivation of this spirit, through the emphasis on democratic values and ideals, through the development of stimulating and wholesome activities, and through the adoption of hygienic attitudes and relationships towards each individual child in our schools, is the educator's answer to the challenge of juvenile delinquency and the educator's unique contribution towards the ultimate realization of the American dream.

SUGGESTIONS IN TEACHING ALGEBRA I AND GEOMETRY I

THIS is not intended for the veteran teacher but for the unfortunate beginner who has five classes flung at him with the command, "Teach." The process of learning how to teach by teaching is at times a cruel one. Co-workers and chairmen are too busy to be of much help and books on methods of teaching Mathematics generally ignore the beginner. The new teacher is told to forget everything he has learned at college about teaching; that it is all very well in theory, but not in practice. What does he do that first term? Flounder as best he can, hoping that next term will be different. Of course it will be—with a term's experience.

My first term of Algebra and Geometry meant long hours of preparation, lack of complete confidence in my presentation of the lesson, and discouragement. This, my second term at the same subjects, has been entirely different. I discovered little things that have been of indefinite benefit both to myself and the class. Many another mathematics teacher may be using devices similar to the ones I am about to suggest, but the beginner is not aware of them.

SUGGESTIONS FOR ALGEBRA I

1. Problems seems to be the bugaboo of many students. I found some who were good in the mechanical part of algebra and yet were unable to handle the problems. This may be due to difficulty in understanding the language, prevalent among children of immigrant parents, or to lack of ability to organize the problems, to pick out what is given and what is sought. The language difficulty can be overcome by having students state the problem in their own words, by defining the more difficult words and by a definite translation of words into processes. The word "exceeds" gives many an intelligent student trouble. Have him translate the word "exceeds" into the words "is more than" and these in turn to the algebraic symbols = ——— + ———.

A student may be helped greatly with the organization of a problem by using the box arrangement. For example:

A is now 12 years older than B; four years from now, A will be twice as old as B is then. What are their present ages?

Name	*Now*	*Four Years Later*
A	12+x	16+x
B	x	4+x

The student asks himself, "Whose age do I know least about? B. Therefore, I'll call his age X." With plenty of practice, most students fill in the boxes readily, but then they hesitate. Why? They can't get the equation. Have them go back to the problem and pick out the sentence or phrase that gives the equation—make them realize that the sentences which have given the information to fill the boxes cannot possibly give the equation. Finally the sentence is obtained. Have the sentence written down, and the exact algebraic translation of each word written underneath, thus:

Four years from now, A will be twice as old as B then.

$$16+x=2\ (4+x)$$

Get the pupils to see that all parts of the verb "to be" should be translated by an equal sign—that the verb "is" is the most important little word in a sentence because it determines the equal sign. Very often a student will have to rearrange the words of the books in order to give a sentence for the equation.

In the problem: A grocer wishes to make a mixture of 60 lbs. of coffee to sell at 40c. per lb. He has some 55c. coffee and some 30c. coffee. How many lbs. of each should he take? The sentence here should be: The cost of 55c. coffee plus the cost of 30c. coffee equals the cost of the mixture.

$$55x+30\ (60-x)=40\cdot 60$$

Or in this problem: The base of a rectangle exceeds its altitude by 9 inches. A better shaped rectangle is formed by making the altitude 3 inches longer and the base 2 inches longer, but this increases the area by 78 sq. inches. A diagram of the rectangles would be of help. The student will pick the phrase, "but this increases the area by 78 sq. inches," and change it thus: The area of the new rectangle is 78 sq. inches more than the area of the old rectangle.

$$(x+11)\ (x+3)=78+x\ (x+3)$$

I have found that picking out the sentence which gives the equation, writing it down and putting the algebraic translation underneath, helps greatly in the solving of problems.

Another simple and often amusing way of clarifying problems is that of dramatization. Just as the dramatized English word holds more meaning for the foreigner than a verbal explanation, so does the algebra problem in action take on new significance for the student. Try it on the rate, time, and distance problems and you will have some veritable races in class.

2. The teacher should be familiar with the common algebraic mistakes and warn the class against them. These mistakes may be due to confusion between processes, to wrong concept, or to carelessness. I am noting a few of the common errors:

a. five more than x, interpreted as 5x.

b. the value of 2x, if x is 6, interpreted as 12x.

c. ten less x, interpreted as 10—x.

d. 3 (a—b) interpreted as 3a—b.

e. the sum of —3 and —5, interpreted as 8.

f. sum of 6a and 10a, interpreted as $16a^2$.

g. the product of x and y, interpreted as x+y.

h. $\frac{1}{2}\cdot\frac{1}{2}=2/4$.

Don't wait until the pupil makes these mistakes. Explain the possibil-

Scanned with CamScanner

ity of their occurrence as new concepts are taught.

3. Factoring is very often a stumbling block to many students. The teacher must be sure that the student has a clear concept of the process—that he is finding the prime quantities which when multiplied will give his original quantity. The only short multiplication process necessary to factoring is the product of the sum and difference of two quantities—mention may be made of cross multiplication. The three cases taught are: the highest common monomial factor, the difference of two perfect squares, and the trial and error method for the trinomial. Students must be given constant drill in just recognizing the cases—you will have to point out that expressions such as these: a^2+b^2, $50a^2-b^2$, and a—b, are not the difference of two squares. You have to teach that the method of highest common factor must always be tried before any other.

Until the student obtains a facility in factoring, I have him state the case before he factors. For instance:

Factor: $32x^2-2y^2$.

Student: Highest common factor 2, $2(16x^2-y^2)$.

Teacher: How do you know $16x^2-y^2$ is the difference of two perfect squares?

Student: You can take the square root of $16x^2$ and y^2 and they are connected by a minus sign.

In teaching the factoring of the trinomial you have to be careful to take one difficulty at a time. First, the coefficient of the highest power of the unknown, unity and all signs positive; second, coefficient unity, last sign positive and middle negative; third, coefficient unity, last sign negative; fourth, coefficient more than unity. In factoring the trinomial, make sure that the student always checks the middle term.

4. The recitation on board homework is usually a waste of time as the students pay no attention. Why should they pay attention? They have done the work at home—why listen to a fellow student repeat it? Instead of having a student read his work from the board, I glance through it and then I ask questions, calling on the class for answers—this compels their attention—it makes them alert to mistakes and it leads them to discover shorter methods of solution. In this way I have often been able to question an entire class on the five or more homework problems which were put on the board.

5. Checking by common sense is a habit that should early be inculcated. In the problem:

When asked her age, a girl replied, seven-fifths of it is 21. What was her age?

As a check on his thinking, have the pupil ask himself—"is her age more or less than 21?"

6. The algebra lesson should be opened with a short quiz—one or two exercises, one on the new lesson and one on review. This not only helps the teacher in picking out the student's weaknesses, but also helps the student by showing him what he missed in yesterday's lesson. This likewise starts the class promptly. These daily tests can be marked by a student. If the teacher has the students recorded in his book as they are seated, it takes but a minute to enter the marks. These daily tests may be graphed by the student on either a daily or weekly progress chart. These charts not only picture the pupil's progress but also arouse a competitive spirit. A horizontal straight line graph becomes the goal. Drill and review lessons may be vitalized by speed and accuracy contests.

7. In a drill lesson it is well to remember that drilling one item at a time is ineffective. If, for instance, you turn to a page dealing with the factoring of the difference of two squares and you have each student do one, you will find all the answers perfect; but if you give them another type of example, they are stumped because it is easy enough to follow a set pattern without thinking. Therefore, drill several items at one time—as simple addition, subtraction and multiplication—first and second case of factoring, and so on.

8. A note-book should be kept in algebra for the practice of exercises that are done in class. Teach something new, assign problems for the students to practice and then you find that they have no paper to work on. A note-book just for algebra is useful.

Suggestions in Geometry I

The teaching of geometry is simpler, and yet more difficult, than the teaching of algebra. Simple, because the subject matter is more interesting and decidedly less mechanical, so that there isn't that fear of monotony and boredom which arises in the algebra. More difficult, as it requires greater skill in presentation.

1. Geometry is usually begun with a brief history of the subject; then come simple constructions, such as bisection of a line and angle, erection of a perpendicular and construction of simple triangles. I discovered rather late in the term that the students find the construction of geometric designs fascinating—they could be introduced very easily with the constructions at the beginning of the term.

2. The axioms should not be taught as such, they should be explained as they come up in problems. For instance, given the square ARFO with points, C, E, D and B, taken on AR, RF, FO, and AO, respectively, so that CR=OD and BO=RE; prove $\triangle ABC=\triangle DEF$. The student gets the right angles equal and so it remains for him to prove AC=DF and AB=EF. He knows that the whole sides are equal since the figure is a square.

Teacher: What do you have to do to the line AR to give AC?

Student: Subtract the line CR from AR.

(You must make sure that the student understands that he is subtracting line lengths and not letters as in algebra. If he has difficulty in seeing this, give the line lengths numerical values.)

Scanned with CamScanner

Student: To get DF, you subtract OD from OF.

Teacher: But what do you know about AR and OF, about CR and OD?

Student: They are equal.

Thus you lead him to realize the need for the axiom, "equals subtracted from equals, the remainders are equal." And so with the other axioms. I have heard students use the reason "Substitution" without understanding just exactly what was being substituted. Wherever possible, have them actually state the axiom involved or explain the exact substitution.

Spread the axioms over a period of two weeks or so—don't try to cram them into one lesson—bring them in almost incidentally—and then you won't have students saying, as I have heard—"I hate axioms, I don't know what they're all about."

3. Even though the first few propositions are taught intuitively, analysis should be used in their application. Students have difficulty with the demonstrative geometry because they are not taught to analyze. This requires constant practice and patience at first, but at the end of two weeks the results are surprising. In the homework assignment, I ask that the analysis and proof be written for the more involved problems. In the classroom, I have the students think out loud, that is, analyze, for all to hear. Take this simple problem in the early weeks, when the student knows three methods for proving triangles congruent: Given the two overlapping triangles ABD and CEF with points A, C, D, F in a straight line, AB≅EF, AC=DF and △A=F; prove the two triangles congruent. The student recites as follows:

a. How can I prove two triangles congruent?

b. Either by sas, sss, or asa.

c. I know that AB equal EF and angle A equals angle F, since that is given.

d. If I could prove side AD equals CF, then I could prove the triangles congruent by sas.

The student then is ready to give a demonstrative proof.

At first the students think it rather silly to ask themselves questions and then answer them, but it isn't long before they realize its value. As I proceed through the term, I have the students omit the unessential details of analysis—often two or three questions are sufficient to lead to a solution. In the same problem: To prove CS equals SD. The student proceeds:

a. How can I prove two sides of a triangle equal?

b. By proving the angles opposite equal.

c. I can prove angle 1 equal to angle 2 by proving them corresponding parts of triangle ABD and triangle CEF. Then the student is ready for the proof.

Or in the example: Given two parallel lines cut by a transversal in points A and B; prove that the bisectors of the interior angles which meet at K form a right angle.

a. How can I prove angle K a right angle?

b. By showing it has 90 degrees.

c. I know that angle A and angle B contains 180 degrees, since the lines are parallel.

These three questions are enough to lead the student to the demonstrative proof.

4. A goodly number of your acquaintances tell you that they memorized propositions at the time they studied geometry. The tendency to memorize that which is not understood must be stopped at the very beginning of the term. Nothing in geometry need be memorized—what of it if a student states a proposition in his own words, provided he understands and knows how to use it? Memorization automatically disappears with a growing facility in the use of analysis. Teaching the class a proof different from the book, and calling for proofs with diagrams given in various positions, also eliminates memorization.

5. With analysis at his command, you will find the pupil eager to tackle difficult problems. I often assign difficult problems as honor homework—this arouses the competitive spirit, keeps the bright pupils interested and even gets a spark from the dull ones.

6. The diagram plays an important part in demonstrative proof. Students should be taught to mark equal given parts on diagrams. Several lessons of the term should be devoted to drawing a diagram from words and these should be followed by frequent practice. Students also have difficulty in picking out the hypothesis and conclusion.

In the problem, The altitudes to the legs of an isosceles triangle are equal, you will find many students saying given the altitudes equal. Straighten the student out on these seemingly little points and you will find a marked improvement.

7. Models have played an important part in my teaching of geometry. HIGH POINTS recently published an article by Mr. Charosh of New Utrecht on the use of models in geometry. Not only did I use the models to demonstrate, but I also had the students build their own. I gave them a month, suggesting that they use any material they wished—paper, wood, metal—that they paint or varnish them and mount them on a chart explaining just what the models represent. Considering the crudity of the models used in class, I was astounded at the results. A few models were brought in before the date set, but at the required time practically every student in my two geometry classes brought in a model. They were so excellently done that I had them on exhibit in the school library; a picture of a few of them appeared in the *New York Sun* of June 22, 1932. Some were of wood, some of paper, some of metal, some painted all sorts of colors, some neatly varnished and all mounted on printed charts. These models were all movable, showing that the theorem was true for all positions. Some students combined several propositions on one model; I received one model that demonstrated six theorems. The students spent long hours making these; they enjoyed it, so did I. They will never

Scanned with CamScanner

forget the geometric facts learned from these models.

From a few suggestions made here, you will notice that I have attempted to x-ray the pupil's mind while he is struggling with new mathematical concepts. Therein lies the little trick of success. Put yourself in place of the student, try to recall the thoughts that went through your mind when you were taught how to subtract algebraically or shown the obvious fact that halves or equals are equal. Weren't they rather confused, vague thoughts? Therefore, help the child to organize his thinking by mechanical aids, if necessary, such as the box arrangement and the writing of the equation sentence in problems or by analysis in geometry.

Appeal to the visual and manual senses as well as to the intellectual. Avoid the cut and dried. I have heard teachers say, "Children these days expect us to entertain them." Wrong interpretation on the part of the teacher! Put the word "interest" in place of "entertain" and the sentence reads correctly. "Interest" the children in what you are teaching; put some personality into your work; inject some humanity and understanding—a bit of humor—and you will find it more than worth the effort. You will find the youngsters your friends instead of just your pupils.

ESTHER D. SWEEDLER.

Curtis High School.

A VIEWPOINT FOR PSYCHOLOGY

THE April, 1932, issue of HIGH POINTS carried as its first main article "Different Schools of Psychology and their Influence on Education," by Joseph B. Fish. Here was given an exposition of six prominent schools of psychological thought.

Mr. Fish's article, as I took it, did not purpose to go beyond a clear, concise statement of these conflicting schools, and how their influence has been felt in education; it did not seek to gain adherents to any of them.

Now I believe teachers would welcome an evaluation of some of the viewpoints in current vogue in psychology. That is what I shall attempt to give. I wish to explain the basic differences among these various systems of psychology, and to recommend the viewpoint I consider most fruitful.

The confusion which today exists in psychological thought comes chiefly from its old indebtedness to philosophy, of which it is an outgrowth, and its inability quite to redeem itself. Take the roster of those accredited in the history of psychology as its founders—Plato, Aristotle, St. Augustine, St. Thomas, Descartes, Spinoza, Leibniz, Hobbes, Locke, Berkeley, Hume—it reads like a history of philosophy. In the speculative systems of these philosophers psychology has its grounding. No wonder, then, that psychology which today seeks standing among the exact sciences, based upon knowledge, finds itself so firmly enrooted in metaphysical abstractions.

MIND—CONSCIOUSNESS INTROSPECTION

The Subjective Systems

Modern psychology began as a study of consciousness and mind; its method was introspection. Yerkes told us, "The subject matter of psychology is consciousness." Judd says, and so does Angell, "Psychology is the science of consciousness." And Angell, without intending clairvoyance, wrote "An Introductory Study of the Structure and Function of Human Consciousness."

Consciousness, as every one is presumed to know, is Awareness. Beyond that definition by synonyms, introspective psychology does not take us. If we inquire the nature of consciousness, we are variously answered. Some say it is spatial; others say it is not. Some say it consists of unit ideas with gaps between; some say it is continuous, never ceasing from birth to death. Some say it is located in the brain; others say it may be located outside the brain. Titchener, of Cornell, especially, applied himself to a study of the structure of consciousness.

Now let us turn to the method of traditional psychology—Introspection. This is simply a "looking inward" upon the mind. In the development of this method, Titchener stands head and shoulders above his contemporaries. He was imbued with the laudable faith that the human mind (the entity of which consciousness is a function) could be limited to laws by studying introspections. To Titchener and his disciples a training in introspection was the basis of psychology. It was developed to such extremes that it became an art. The experimenter who could analyze a mental process into its pure sensations was the master. And we have it from Yerkes that "No one who is unable to observe the wonders of his own consciousness can really enter into the kingdom of psychology."

Present day schools of psychological thought, with one exception, are based upon the consciousness-mind-introspection philosophy. Their ideas, their methods, their terminology, are subjective. Whatever differences obtain among them are of minor significance compared to this most fundamental similarity in their whole fibre—their subjective point of view. Associationism, structuralism, functionalism, parallelism, interactionism, purposivism, psychoanalysis, and Gestaltism—there is not one which is not predicated upon mind as a basis; not one which does not treat of sensations, images, perceptions, and the whole category of traditional terms.

EXPERIMENTATION—STIMULUS AND RESPONSE

The Objective System

The one school of psychological thought which differs from the others

Scanned with CamScanner

is the objective school. Most prominent of the objectivists is John Watson, who popularized objective psychology as "behaviorism," but which its first American proponent, Max Meyer, still prefers to call objective psychology. This school rejects mind, consciousness, introspection, sensation, image, and all other subjective methods and terminology. It sets itself to a study of observable human conduct, as contrasted with the study of consciousness. Its method is experimentation and observation, rather than introspection. Its terminology is stimulus and response, in contrast to sensation and image.

The classification of psychological systems into subjective and objective, I hope you will find clarifying. It is a key for penetrating confusion. As we draw out the implications, we shall see what occasions such conflicting views in psychology—a state of affairs which some are misled into believing healthful for its advance.

An Evaluation of Subjective Psychology

The aim of psychology, broadly, should be to give us a knowledge of human motives and conduct so that we may learn to predict and control them. If it is to concern itself mainly with playing with poetic figures of speech, or cluttering an already burdensome nomenclature with abtruse and abstract terms, it becomes a pleasant pastime, a mere hobby, a vacant evening's occupation, not a scientific study.

It is well, too, before considering subjective psychology, to caution ourselves that we have all been trained in the terminology of the subjective school. So vitally has its verbalizing become part of us and colored our expression in psychology, that it is impossible for us to break away. We are predisposed toward it; and this caution is advanced that we may somewhat, at least for the time being, unprejudice our thoughts.

Psychology began as a study of the mind; its etymology tells that. But what is mind? Few psychologists would have the temerity of Descartes to locate it in the pineal gland; and few would undertake to treat it as an organism, as Angell did. We may postulate mind as an axiom, and assume what it would be well to establish by proof; or recognize mind as a theoretical concept about which to organize our knowledge. And from a scientific point of view "mind" should be retained or rejected, depending upon its usefulness or uselessness.

Consciousness, which is presumed to be a manifestation of mind, should be judged by the same standard—What is its value for scientific study? Its importance in psychology is a throwback to speculative philosophy. It is another way of saying "soul," "ego," "self." Among the ancient Greeks it was customary to assume consciousness in water, mountain, tree, air. "Nature abhors a vacuum" is an apt example of attributing consciousness to nature. So was the ancient idea of thunder as the wrath of God, or the angry sea as the bellowing of Neptune. Our poetry abounds in such figures of speech. But if we are to understand human conduct, we must be more scientific; we must deal in more specific terms. We must experiment and measure. No one has ever proposed a unit of consciousness. Yet it is on the groundwork conception of consciousness that the subjective schools builds the superstructure of psychology.

And the structure and function of consciousness, we are told, may be discovered by introspection.

What have consciousness and introspection availed us in psychology? Have they helped us to an understanding of human conduct? We turn to the work of Titchener at Ithaca. Here were the best trained introspectionists in the country. The scalpel of shrewd introspection dissected every mental state in the course of an experiment—but the laws of the mind lay unrevealed. Psychology has come considerably away from its insistence on introspection, but it is still dominated by the tradition and terminology of the consciousness-introspection school. And that is the important idea to know.

But why didn't introspection reveal the nature of consciousness and the laws of the human mind? Because, simply, introspection is subjective. Each one's introspections are his own, not susceptible to proof. One psychologist sets down certain attributes of image; another sets down an altogether different category. How can we prove or disprove? Introspectionists in Oshkosh get a "glassy sensation" with certain visual images; but in Kalamazoo introspectionists cannot just discern it. There follows, somewhere else, a controversy between the exponents and opponents of imageless thought. An oceanful of ink is spilt, and tempers are frayed over these discussions in vacuo. Wundt stoutly maintains there can be no thought without images; Bühler insists as strongly that under controlled introspection he and his followers had thought without images. Well, what are you going to do about it?

It should be clear that such disagreements cannot justly be imputed to the undeveloped state of psychology. If psychology were as old as the hills and clung to introspection as its method, we should still find radical disagreement. Confusion comes of each developing his own system, and none being verifiable because they are all subjective.

Titchener himself made a pertinent commentary in speaking of the psychology of feeling: "The professional and the amateur psychologist exchange ideas on equal terms; here is a field in which a general impression is worth as much as an experimental result." The psychology of attention and sensation are in a like state.

I do not mean to suggest that we should abandon introspection. It is delightful. It gives our literature a depth and warmth which objective treatment cannot. But to make it the method of a branch of study which makes claims to exactness is to invite failure. Among students of psychology in its earlier days it was a commonplace that psychology was inter-

Scanned with CamScanner

esting, but it taught them what they already knew.

It is a direct outcome of the introspective method that psychological terminology, and consequently psychology itself, is so indefinite. To put less emphasis upon introspection, but to retain the terminology that introspection bore, is inconsistent.

Terminology is decidedly important. Words are thoughts. Scientists have so well recognized this that their nomenclators turn to Greek for new terms, devoid of life and personality—words that are like algebraic symbols—unequivocally explicit. Modern terminology is likely to have been subjected to language processes, so that original meanings have been altered; and subjective interpretations would confuse exact understanding.

We have spoken of mind and consciousness. Sensation and image and perception and attention are not clearer. Does a sensation have quality, intensity, duration, clearness? What difference does it make? Are you stirred to know that a visual image has protensity and extensity; or that images have succession, fusion and adhesion? Do you relish recollections of hours and days spent over the conative, cognitive, and affective processes and their countless obscure attributes?

It was once my misfortune to spend six months studying the psychology of meaning and judgment. What an impenetrable wilderness of words! One "authority's" guess is as good as another's. I cannot resist a few choice examples, because too much can not be made out against the method and the nomenclature we have been prey to.

I was impressed with the profound observation that falling down is not a thinking act, but may become the object of our thoughts. I learned that association of ideas is by universals—and that meaning is the universal; that meaning does not exist "per se," but is inherent in images; that meaning precedes image, that image is merely on illustration of meaning; that image is meaning; that image and meaning are in reality fused but discriminable; that thinking may go on without meaning; that thinking must have meaning. There is Reintegration, Intentionalism, Logical Universals. There is static meaning and dynamic meaning. And somewhere in this welter, space must be allowed for a "psychophysical continuum." Then, to give you the last word, as it was given to me, the trouble lies in the fact that for the term "meaning," which is not adaptable to psychological needs, we need more terms to cover the scope of the word. We need a quadilateral division into The Significant, The Significance, The Signified, The Signifying.

All nonsense! Where will it get us? These verbal gymnastics, in my opinion, are meant but to strike awe in the unsuspecting. Just some new curious, learned way to say old, simple, and often well-known thoughts.

The difference between the ancient idea of "horror vacui" and Toricelli's explanation of atmospheric pressure is the difference between the subjective and the objective—terminology, if you please. Whether you explain the attraction of the flame for the moth as a Desire, or as a neural connection between eye and wing muscle, does matter. Far from being an explanation, the subjective terminology is a positive detriment to scientific advancement. It offers a specious explanation, and those who take it are disinclined to seek further. It is only when an objective, verifiable explanation is formulated that science begins its prolific progress. It is only when measurement is performed that it makes strides.

So I think it is high time for psychology to jettison this whole lumbering cargo of the subjective school. We have had enough arm-chair psychology with its lengthy introspections and speculations, in which each psychologist is an authority. Consciousness and introspection and their wake of subjective terminology have availed little. They have not stood the test of science, and so merit rejection.

And now, to conclude our thoughts on the subjective school, we should consider present-day schools of psychological thought in the light of what has been adduced.

Structuralism studies what mind is; Functionalism studies what mind does. Both are based upon consciousness and introspection. They lead to little more than speculative discussions.

Purposivism or hormic psychology, as propounded by Macdougall, and implied by Freud, is a sort of mystic philosophy which may be summed up in the familiar epigram, "There is a divinity which shapes our ends." The mind, and all impulses and activities, are believed to be working, automatically, towards a purpose they have in view. This endowment of the human organism with an inner force which drives it toward a goal is an interesting symbolic interpretation of human action. But not for science.

Psychoanalysis goes further than other subjective systems in its interpretation of human action. What Darwin did for biology with his theory of organic evolution, what Keppler did for astronomy with his theory of the solar system, Freud has attempted for psychology in his elaborate theory based upon the "unconscious." The symbolisms Freud invokes to sustain his theory stamp it an art, plainly. They give it a literary flavor which literature has not been slow to appropriate. The pity of it, so far as psychology is concerned, is that it is couched and quilted from tip to toe heavily with the subjective, equivocal terminology which science finds inarticulate. Jung and the Zurich school have objectivized one phase of it in the time-reaction tests. Let us hope for more.

Gestaltism, our latest childbirth in psychology, makes its additions to our nomenclature to give us more supernaturalism. The mind is possessed, so we hear, of a grouping sense. This integrates experiences and gives them meaning. "Configuration patterns" that we make instinctively develop in us "insight" so that we may accomplish "continuous wholes." Says Koh-

Scanned with CamScanner

ler, "We now have to solve the problem of the segregation of wholes in the temporal and spatial extension of kinesthetic experience." Don't you wish it were more intelligible? Insight, instinctive grouping sense, integrating power of the mind, configuration patterns, continuous wholes—all vague, all subjective.

An Evaluation of the Objective School

John Dewey ventured the thought that the World War might have been averted had the social sciences kept pace with the physical sciences. In the latter are considered phenomena which are observable and measurable —and verifiable. It is patent in science that the discoverer must formulate the experimental conditions under which the phenomenon described may be observed by anyone of accurate scientific training. And the description must be made in unmistakable terms so that the experiment may be reproduced identically.

The objective school believes that the laws of human behavior can be formulated only as a result of experimentation and observation under standards as rigid as those prevailing in the physical sciences. Its workshop is the scientific laboratory.

The ancients, we know, attributed consciousness to numerous inanimate objects. The physicist of today does not concern himself with such an attribute. Nor should the psychologist concern himself with the attribute of consciousness in the human organism. It has served but to confuse. Objective psychology rules it out.

Objective psychology rules out, too, the subjective, ill-advised terminology of traditional psychology. Mind, image, perception, sensation, satisfaction, insight, and the rest should be rejected, or replaced with explicit terms. Objective psychology speaks of definite stimuli rather than desires or impulses. It speaks of neural arcs, rather than association of ideas.

The Objective school gives a simple, unified method of interpretation for the facts its experiments adduce. It seeks no metaphysical aid. The human being, it submits, is an organism responsive to the same forces as other organisms. It recognizes the greater complexity of the human, and lays it to a more complex nervous system, and consequently more varied habits, most important of which are language habits. But it divests the human organism of the mystery and wonder with which anthropocentric philosophy has invested it. Cause and effect, conservation of energy, and all the laws of matter and motion—human action can and should be interpreted under these precepts of natural science. Sadly, though, such a viewpoint means to many that objective psychology sees the warm, throbbing human personality as an impersonal, cold machine. So it does. So does physics see the screeching, fire-belching locomotive, madly racing time to make its destination. The escape evidently is in artistic expression.

Human action is habit, builded upon reflexes or inherited nerve pathways. And habit is the outcome of stimulus and response. If you tickle us, do we not laugh? If you lash us, do we not wince? Stimulus and response—you have here in full simplicity the basic terminology of the objective school. Human action is reducible in every case to this formula.

The conditioned reflex, or conditioned habit, of which the objective school has made much, explains the complex reactions of the human organism. Conditioning is merely substituting one stimulus for another. To Pavlov, the Russian physiologist, we are indebted for the first experimental evidence of the conditioned reflex. His laboratory work on the salivary glands of dogs showed definitely how stimulus substitution works. The sight of food stimulates the salivary glands. If simultaneously with the presentation of food a gong is struck, it is found, after a few trials, that the sound of the gong alone will bring the same salivary response. A life situation will make this principle clearer. One day the teacher's loud scolding causes fear in the child. Next day the mere sight of the teacher brings about the reaction of fear. Following out this line of thought, we can interpret the most elaborate life situations in terms of stimulus and response.

Psychology owes its worthwhile accomplishments to the experimental method, without detriment of introspection. When we experiment under controlled conditions to find the effect of coffee or alcohol upon the human system, we need to measure performance time by the stop watch, and nervous reaction by the cardiometer or smoked drum. A sufficient number of records will permit reliable generalization. Here we work with the human machine before us. Our results are objective—visible, measurable, verifiable. It matters little that the subject says he felt groggy. Let the measure tell. His retrospective introspections (as all introspections must be) will needlessly complicate our scientific findings, if we take them for more than interesting reflections. Do we wish to test ability to learn poetry by heart by the "part" method or the "whole" method? Or the most desirable length of learning periods, and intervals between such periods? Then let us measure.

Baird has reported work on a city telephone directory. It was too bulky, and too much time was consumed in finding numbers. The results of experimentation showed that by using a four-column page instead of a three, and by better spacing, the bulk could be lessened by twenty per cent and telephone numbers could be found ten per cent more rapidly. It was not necessary to investigate the sensations of the directory users.

Objective psychology, to make a last point, considers learning as habit formation. It does not need satisfaction and dissatisfaction, pleasantness and unpleasantness. They are subjective, and so, confusing. Recency? Yes. Frequency? Yes. And a knowledge that the organism avoids, as a mechanical life process, harmful stimuli. The white rat may get an

Scanned with CamScanner

electric shock three times down a blind alley, and choose the direct path toward food but once. Yet the next time it chooses the direct path. Why? It has acquired a multiple habit, of which the whole previous situation is a stimulus—sending it down the direct path. We do not need satisfaction or consciousness or any other mystic attribute. Rather should we work to trace the nerve pathway of the stimuli involved. Max Meyer, in his "Psychology of the Other One," has given us such a theoretical explanation in terms of neural arcs.

The objective school offers psychology a simple consistent point of view for the study and interpretation of human action. It gives psychology rank with the physical sciences, which have made such splendid advances. Between subjective and objective psychology, both of which, broadly, seek to explain human conduct, scientific theory urges the latter for the reason that it is simpler. By objective methods and objective terminology, psychology has been building a body of exact knowledge that will carry us quicker toward the goal we have set—the prediction and control of human behavior.

THE SECRETARIAL STUDIES—A UNIFIED PROGRAM OF CULTURAL, VOCATIONAL AND CHARACTER TRAINING

Report Prepared by a Special Committee of the Association of Chairmen of Departments of Secretarial Studies

INTRODUCTION

THIS report purposes to deal with the following topics bearing on the problem of articulation of the secretarial studies—the secretarial studies comprising stenography, typewriting, and secretarial training:

1. Fundamental Objective.
2. Specific Aims.
3. The Present Condition of the Secretarial Studies With Suggestions for Improvement.
4. Analysis of the Subject Matter of the Secretarial Studies.

The fundamental objective of the secretarial studies and the specific aims of each subject are of prime importance in determining the most satisfactory sequence of these studies and in providing for their adequate articulation.

FUNDAMENTAL OBJECTIVE

In its remote aspect it is the fundamental objective of the secretarial studies to contribute to the ultimate goal of all education in a democracy, which is the harmonious development of the individual as a citizen, or member of a social group; as a worker, or member of an economic organization; and as an independent personality.

In its more immediate aspect it is the fundamental objective of the secretarial studies to prepare the individual desirous of entering stenographic employment to realize this harmonious development through the work of his choice. To that end, these studies aim not only to equip the individual with the knowledges and skills which will enable him to earn a living at stenographic work, but also to develop those standards of performance and conduct and those mental traits which will enable him to serve society well through his work as a stenographer, to maintain the right relations toward his fellow-workers in the business organization of which he becomes a member, and to find in the stenographic field his own best development.

This fundamental objective is to be realized through the use of materials and methods (1) which shall provide scope for the exercise of initiative, resourcefulness and independent thinking, (2) which shall lead the pupils to develop desirable habits, ideals and attitudes, and (3) which shall build up in pupils the power to adapt themselves to the business office and to utilize, in the new situations encountered therein, the knowledges and skills acquired in school. Without minimizing the importance of developing skill in the technique of shorthand and typewriting, it is recognized that, if this power of adaptability is to be developed, the emphasis in the teaching of the secretarial studies must be on training the pupils to interpret and understand the meaning of the materials used.

SPECIFIC AIMS

Specific Aims in the Teaching of Typewriting

I. Of first importance is the development of an efficient operating technique; this is the basis of typing skill. Proficiency in the practical application of the operating technique in all the ordinary problems of the business office—which means the ability to copy accurately at a fair rate of speed—is the next step.

II. Practical instruction in, and a sufficient amount of practice on, laboratory problems in order to develop a correct knowledge of the form and arrangement of typewritten business papers is highly essential. The power to type such papers in attractive form from unarranged copy is of vital importance, since this kind of work in connection with the transcribing of shorthand notes is fundamental to typing success.

III. To aid the pupil, through the drill in mental alertness required in the learning process, in developing his powers to use good English, to spell correctly, to detect and correct errors—in other words, to turn in work that is commercially acceptable.

IV. In each grade a definite amount of work should be accomplished so that the teacher of the next

Scanned with CamScanner

grade on receiving pupils will know just what to do as far as the pupils are concerned.

V. All first-term classes should be held in one typewriting room; all second-term classes in another, so that pupils may learn how to operate more than one machine.

Specific Aims in the Teaching of Shorthand

1. To train the pupils in the ability to take verbatim dictation at a reasonable rate of speed.
2. To develop a fair degree of skill in transcribing on the typewriter shorthand notes taken in dictation.
3. To acquaint the pupil with details of business practice related to shorthand.

While a mastery of the technique of the subject is the controlling factor in shorthand instruction, it must be remembered that technical ability alone will not meet the requirements of business. The stenographer must combine his technical ability with general training and a knowledge of business practice if he is to qualify as an efficient office worker. The teaching purpose, particularly in the second year, will include, therefore, the correlation necessary to give the pupil this desired equipment.

Specific Aims in the Teaching of Secretarial Training

I. *Knowledge:* To build an informational background dealing with business practices and office procedures.

II. *Skills:* To develop secretarial skill through:
   1. Stenographic and typewriting practice;
   2. Office machine practice;
   3. Routine office practice;
   4. Projects definitely related to the secretary's work.

III. *Ideals:* To mould character and personality through the development of desirable traits and right attitudes.

IV. *Powers:* To provide adequate opportunities in the classroom and in the school at large for the application of these knowledges, skills, and ideals to genuine office situations. A complete training in this subject should result in the acquisition of knowledges, skills, and ideals which, when made to function properly, lead to secretarial efficiency. Finally, power for the solution of business situations will be attained through the proper integration of these three elements: content, skills, and traits.

Secretarial training is intended as a finishing course that will insure vocational competence in the field of stenographic employment and that will reveal to the pupil the opportunities for success through advancement in the secretarial field.

The technical stenographic skills are indispensable. However, the acquisition of these skills must be coupled with the development of specific intellectual, moral and personal qualities and traits that make for the right kind of personality.

Present Condition of the Secretarial Studies With Suggestions for Improvement

Present Sequence of the Secretarial Studies

The present sequence of the secretarial studies in the junior and senior high schools, according to the commercial course adopted by the Board of Superintendents in May, 1932, is as follows:

9th Year	*10th Year*
Jr. High Typewriting 1 & 2	Typewriting 3
11th Year	Shorthand 1 & 2
Typewriting 4 & 5	Shorthand 3 & 4
Shorthand	*12th Year*
	Secretarial Studies 1 & 2

Typewriting

Typewriting is required of all pupils in the junior high school who are taking the commercial course. To those pupils who drop out of school at the end of the 9th year it offers a means whereby to secure employment in junior occupations. To those pupils who continue the secretarial studies in the high school it becomes the foundation on which to build the higher stages of the skill, culminating ultimately in transcription skill. If this 9th-year work is to be valuable to both types of pupils mentioned, it is essential that the minimum requirements for the first year of typewriting, as laid down in the Typewriting Syllabus adopted for the use of high schools in February, 1931, be exacted of all pupils promoted into the 10th year. This is particularly important in the case of junior high school pupils who continue the study of typewriting in the senior high school. In a number of senior high schools pupils from some junior high schools have requested through their parents that they be demoted to a lower grade of typewriting, and in such cases the repetition of the work in the lower grade has been found to be to the pupils' best interests. The specific weaknesses in the training of such pupils seem almost invariably to have been inability to write by the touch method and inability to work out problems in arrangement of material from unarranged copy. Inasmuch as these skills are basic to the development of transcription skill, it is important that special attention be given to these in the 9th-year work.

As has been indicated in the introductory part of this report, the whole problem of articulation is contingent upon general objectives and specific aims, inasmuch as these determine the teaching materials and methods to be used. It is, therefore, recommended that in the 9th-year work of typewriting the junior high schools be guided by the same fundamental objective and the same specific aims as determine the direction of the work in the senior high schools, so that in the teachers' choice of material, in their method of presenting this material, and in their measurement of the pupils' achievement and fitness to continue the work of a higher grade, the

Scanned with CamScanner

same procedures and standards which govern the teaching of typewriting in the senior high schools may prevail.

To insure the realization of these common goals, it is suggested that the junior high schools consider adopting the Typewriting Syllabus of February, 1931, now used in the senior high schools. It is further recommended that the supervision of this work in the junior high schools be extended to the Director of Commercial Education, or that it be assigned to some other competent expert in the field, who may work with the Director toward bringing about the desired articulation.

Shorthand

Shorthand is begun in the 10th year of the senior high school, and the correlation of shorthand and typewriting is provided for in the 11th year, so that the pupil who is obliged to leave school without completing the 4th-year work is equipped to do transcription of shorthand dictation.

Some shorthand is still offered to the Commercial III, or drop-out group of pupils in the junior high school. It is recognized, of course, that shorthand cannot possibly function vocationally at this age level, particularly in the case of pupils who have been retarded in their school progress because somewhat below average in mental ability. Where pupils from this group, instead of dropping out of school, have chosen to enter the high school, it has been found impossible to build on what the pupils have acquired in this subject. If such pupils elect the commercial course, with secretarial studies as a major, they are now required to start the study of shorthand over again.

Secretarial Training

Secretarial training is offered in the 12th year of the senior high school as an elective for those pupils who have completed two years of work in shorthand and at least two years of work in typewriting. In view of the promotional possibilities in stenographic employment open to those young people who can bring to their office job a personality in which desirable attitudes and traits of character are integrated with secretarial skills and knowledges, it is highly desirable that pupils in the secretarial course round out their studies in stenography and typewriting with secretarial training. For this reason it is urged that the administration in each high school coöperate with the secretarial department to the end that the school may be turned into a field laboratory where pupils taking this finishing course may have the opportunity to have their characters moulded through practical experience in secretarial work, such experience to be obtained under appropriate guidance in accordance with whatever plan may be devised by the chairman of the secretarial department with the assistance of those coöperating.

College Entrance Credit for the Secretarial Studies

Pupils who enter high school with quite definite plans to go to college upon graduation are at present deterred from choosing the commercial course because of the failure of the colleges to give adequate recognition to the secretarial studies in evaluating the various studies which the high school graduate has to offer for college entrance. This is particularly unfortunate in the case of those pupils who, were it not for these restrictions, would elect the commercial course in the high school with a view to further specialization in commercial work in college.

Those pupils who enter high school with only a probability of going to college are for the same reason deterred from electing the commercial course; or, if they do elect it, they are virtually obliged to give up the prospect of going to college. Many of the pupils who elect the general course under these circumstances do not eventually go to college, but choose rather, or are obliged to choose, to enter a vocation. With no specialized training for business, such pupils, upon graduation from high school, find themselves at a disadvantage in seeking office employment.

A more liberal policy on the part of the colleges in crediting the secretarial studies toward the requirements for college entrance would mean a greater freedom of choice on the part of all pupils to elect the secretarial studies. This would probably result in a more able type of pupil being attracted into secretarial work. At the same time it would not bar from college those pupils of ability who, at the time of entrance into high school, did not plan definitely to go to college but who, in the course of their high school work, developed the desire or acquired the means to do so.

Analysis of Subject Matter of the Secretarial Studies

Typewriting

Knowledges	*Skills*	*Attitudes and Appreciations*
1. Knowledge of the various parts of the typewriter and the uses of each part.	1. Skill in manipulating each part of the typewriter with precision, accuracy, and economy of effort.	1. Appreciation of the contribution to human progress resulting from the invention of the typewriter and from subsequent improvements of the mechanism.
2. Knowledge of the elements that constitute efficient operating technique.	2. Skill in coördinating the manipulation of the various parts of the machine so as to be able to operate the typewriter with facility, with a high degree of accuracy and with a fair degree of speed.	2. Appreciation of the usefulness of the ability to typewrite by touch. Desire to achieve a high degree of mastery in this skill.

Scanned with CamScanner

Knowledges	*Skills*	*Attitudes and Appreciations*
3. Knowledge of the proper care of the typewriter to insure its best functioning at all times and to obviate the necessity of frequent repairs to the machine.	3. Skill in cleaning and oiling the typewriter and in replacing worn ribbons without disturbing the functioning of any working part.	3. Desire to conserve expensive equipment and to observe orderliness in its care. Desire to be coöperative.
4. Knowledge of the principles of form and arrangement as applied to typewritten material.	4. Skill in discriminating between good form and arrangement and poor form and arrangement in typewritten material.	4. Intelligent criticism of one's own work and that of others. Esthetic appreciation of what constitutes good taste in the form and arrangement of typewritten material. Exercise of judgment in the selection of the best forms.
5. Intelligent understanding of the content of business letters of various types and other business papers, together with a knowledge of how to apply the principles of good form and arrangement to the typing of such papers from unarranged copy.	5. Ability to set up from printed or handwritten unarranged copy, or from shorthand notes, business letters of various types, addresses on envelopes, messages on postcards, tabulations, invoices, financial statements, telegrams, and other business papers, such set-up to be in harmony with the principles of correct form and artistic arrangement.	5. Spirit of inquiry of intellectual curiosity with regard to the human relations underlying business transactions. Desire to achieve and maintain high standards of accuracy, neatness, and good taste in form and arrangement of typewritten work. Desire to exercise judgment and express individuality in the selection of correct forms.
6. Knowledge of the spelling, meaning and use of words comprising a business vocabulary, of the simple rules for dividing words, of commercial abbreviations, and of what constitutes good English in business forms.	6. Ability to produce accurate typewritten transcripts of printed or typewritten material which needs to be corrected, of material written in various styles of handwriting, or of shorthand notes.	6. Desire for accuracy and a high degree of efficiency in producing typewritten work that is commercially acceptable.
7. Understanding of the use of the dictionary as an aid in ascertaining the correct spelling, meaning and division of words, and the correct abbreviations of commercial terms.	7. Ability to use the dictionary expeditiously in cases of doubt concerning the spelling, meaning, or division of words, or the correct abbreviation of commercial terms.	7. Desire to apply ideals of accuracy, thoroughness and reliability in checking spelling and division of words and correctness of abbreviations, in order to avoid all possible errors in the typewritten product.
8. Knowledge of the proper use of carbon paper.	8. Skill in the care and handling of carbon paper and in the correct technique required to produce clean, legible copies of typewritten material.	8. Neatness in the production of carbon copies of typewritten material.

Knowledges	*Skills*	*Attitudes and Appreciations*
9. Adequate conception of the standards which characterize the perfect typewritten product, combined with understanding of the procedure to be used in editing one's work and in correcting errors.	9. Skill in evaluating the typewritten product in terms of correctness of form and artistry of arrangement. Skill in discovering typographical errors in the course of editing, and in correcting such errors without defacing the typewritten product.	9. Intelligent and careful criticism of one's work. Thoroughness in checking one's work for accuracy. Neatness and reliability in making corrections. Responsibility in completing the job well and on time.
	SHORTHAND	
1. Knowledge of the elements that constitute correct writing habits.	1. Skill in writing shorthand forms with facility and a high degree of accuracy. Skill in the mechanical details of note-taking, such as writing in columns and turning the pages of the notebook.	1. Appreciation of the contribution to human progress resulting from the invention of shorthand and from the subsequent development of improved systems. Appreciation of the usefulness of the ability to write shorthand accurately and rapidly. Desire to achieve a high degree of mastery in this skill. Appreciation of shorthand technique as a fine art.
2. Understanding of the principles of the shorthand system.	2. Skill in applying the principles with facility to word-building.	2. Attitude of careful observation and critical analysis in studying the component elements of shorthand outlines and in building new outlines.
3. Understanding of the principles of phrasing.	3. Skill in applying the principles of phrasing with facility to phrase-building. Skill in reproducing common phrases with a high degree of automatization. Skill in initiating without mental hesitancy less common phrases under the stress of dictation.	3. Attitude of careful observations and critical analysis in studying the component elements of shorthand outlines and in building new outlines. Perseverance, industry and self-direction in doing the studying and practice work required to achieve a high degree of automatization in the writing of the shorthand forms.
4. Knowledge of the brief forms or word-signs.	4. Skill in reproducing the brief forms or word-signs with a high degree of automatization.	4. Perseverance, industry and self-direction in doing the studying and practice work required to achieve a high degree of automatization in the writing of these shorthand forms.

Scanned with CamScanner

Knowledges	*Skills*	*Attitudes and Appreciations*
5. Acquisition of a large shorthand vocabulary comprising words common to many lines of business and those peculiar to special lines of business carried on in the local community.	5. Skill in reproducing instantly the shorthand outlines for many words in common use in business and those peculiar to special lines of business carried on in the local community. Skill in initiating without mental hesitancy the shorthand outlines for less common words under the stress of dictation.	5. Same as 4.
6. Intelligent understanding of the content of business letters dictated and of the grammatical construction of the language used.	6. Capacity to carry in the mind several consecutive words or groups of words when unable to keep up with the speed of the dictator in note-taking. Skill in "catching" errors of grammatical construction made by the dictator. Skill in correcting such errors.	6. Intellectual curiosity, and spirit of inquiry in seeking to understand the human relations underlying business correspondence. Esthetic appreciation of the qualities which characterize effective business correspondence. Alertness in noting errors of grammatical construction in the dictation, and helpfulness in correcting such errors unobtrusively. Desire to conserve human labor and material by obviating the necessity of having to do the work over again because of errors.
7. Acquisition of a large English vocabulary of business words and commercial terms in good usage today. Knowledge of the spelling, meaning and use of a wide range of synonyms, homonyms, words frequently confused and words commonly misspelled. Knowledge of the simple rules for dividing words.	7. Skill in reading notes fluently from shorthand plates in books and magazines, from one's own notes, from the notes of others, from "cold" notes. Skill in reading notes that are partly effaced or partly cut off. Skill in making accurate transcripts with a fair degree of speed.	7. Desire to further one's intellectual growth. Desire to enrich one's speaking and writing vocabulary. Desire to be competent and helpful in an unexpected situation requiring the transcription of someone else's notes. Desire to be highly efficient in producing commercially acceptable transcripts of dictated matter.
8. Understanding of the use of the dictionary as an aid in ascertaining the correct spelling, meaning and division of words, and the correct abbreviation of commercial terms.	8. Ability to use the dictionary expeditiously in cases of doubt concerning the spelling, meaning or division of words, or the correct abbreviation of commercial terms.	8. Application of ideals of accuracy, thoroughness and reliability in checking spelling and division of words, and correctness of abbreviations, in order to avoid all possible errors in the transcript.

Knowledges	*Skills*	*Attitudes and Appreciations*
9. Knowledge of the elementary rules of English composition and punctuation. Knowledge of the elements comprising correct form and artistic arrangement of typewritten documents.	9. Skill in producing transcripts of dictated correspondence which conform to the standards of the "mailable" letter.	9. Resourcefulness in correlating knowledge and experience gained in various fields with one's shorthand skill. Dependability in being able to produce the "mailable" letter upon the first attempt.
10. Adequate conception of the standards which characterize the commercially acceptable transcript or the "mailable" letter, combined with understanding of the procedure to be used in editing one's work and correcting errors.	10. Skill in evaluating the transcript in terms of correctness of form and artistry of arrangement. Skill in discovering typographical errors in the course of editing. Skill in correcting such errors without defacing the transcript.	10. Intelligent and careful criticism of one's work. Appreciation of the importance of thoroughness in checking one's work for accuracy. Appreciation of the importance of neatness and reliability in making corrections. Responsibility in completing the job well and on time.

SECRETARIAL TRAINING

1. Greater depth and greater breadth of knowledge previously acquired in the typewriting and shorthand classes.	1. A greater degree of skill in producing typewritten work that expresses individuality, yet conforms to high standards of accuracy, correctness of form, and artistry of arrangement. A greater degree of skill in taking shorthand dictation, such dictation to include extemporaneous dictation and dictation of matter other than business correspondence, such as newspaper and magazine articles of current interest, selections from biographies and historical addresses, and articles dealing with business enterprise and success.	1. Accuracy, thoroughness, and dependability in producing transcripts that may be signed and mailed without having to be read by the dictator. Desire to enrich one's store of knowledge and refine one's skill so as to develop power to solve problems in new situations. Desire to continue one's growth through a judicious choice of reading material. Appreciation of the elements that constitute genuine success, and ambition to acquire the desirable traits of character possessed by those who have achieved such success.
2. Knowledge of the elements of secretarial routine embracing	2. Skill in the techniques associated with each element of secretarial routine.	2. Attitudes and appreciations concomitant to the development of the skills involved in secretarial office routine.

Scanned with CamScanner

Knowledges	*Skills*	*Attitudes and Appreciations*
a. Elementary business office routine.	a. (1) Skill in opening, distributing, and collecting mail.	a. (1) Appreciation of the importance of establishing a systematic procedure in handling mail. Accuracy, thoroughness and dependability in following such procedure. Loyalty in handling mail confidentially in the absence of the employer.
	(2) Skill in filing and finding business papers quickly and accurately.	(2) Appreciation of the value of the details of the routine. Accuracy, thoroughness and dependability in following the routine.
	(3) Skill in caring for office equipment, including the employer s desk.	(3) Orderliness in arranging one's desk and work systematically, and in keeping one's typewriter clean. Thoughtfulness in watching ventilation, lights, etc., and in overseeing the equipment and condition of the employer's desk. Willingness in performing minor office jobs cheerfully, not regarding them as menial.
	(4) Skill in securing and caring for supplies.	(4) Orderliness in keeping adequate supplies at hand. Desire to conserve supplies and check waste.
	(5) Skill in meeting callers.	(5) Appreciation of the importance of personal appearance as an expression of the tone of the office. Courtesy in according the same treatment to all callers. Tact in pleasing the caller while conserving the employer's time and energy. Judgment in permitting or refusing an interview. Reliability in planning future appointments when the employer is not available.

Knowledges	*Skills*	*Attitudes and Appreciations*
	(6) Skill in telephone operation.	(6) Appreciation of the contributions to human progress resulting from the invention of the telephone and from its universal adoption. Accuracy and tactfulness in obtaining and in giving information. Desire to cultivate a cheerful, low, voice, with proper inflection and enunciation.
b. Preparation of a daily plan.	b. Skill in organizing the various duties comprising one's daily work.	b. Desire to be orderly, systematic, efficient in carrying on the day's work. Desire to conserve time, labor, materials.
c. Making and canceling appointments.	c. Skill in using the tickler and daily calendar. Skill in handling the correspondence involved in making and cancelling appointments.	c. Accuracy and thoroughness in recording appointments. Reliability and tact in writing letters of appointment and letters canceling appointments.
d. Answering routine correspondence.	d. Skill in composing effective business letters.	d. Desire to write letters which reflect the ethical standards of the organization. The "You" attitude in writing letters.
e. Proper disposition of incoming telephone messages.	e. Skill in obtaining information by telephone, in listing such information, and in seeing that it reaches the proper person.	e. Thoroughness, iniative and tact in obtaining all significant information. Reliability in listing such information accurately and in intelligible form. Responsibility in getting the information to the proper person promptly.
3. Knowledge of the procedure in planning a simple filing system.	3. Skill in organizing a simple filing system in the general office of high school, the filing system in the office of a chairman of department, the filing system of the G. O., the filing system of a small business office.	3. Appreciation of the service a secretary can render to his employer in the capacity of organizer. Desire to assume greater responsibilities than the immediate job calls for.

Scanned with CamScanner

Knowledges	Skills	Attitudes and Appreciations
4. Knowledge of the use of reference books.	4. Skill in obtaining information from commercial directories and journals, personal directories, financial directories, general directories.	4. Accuracy in securing exactly the kind of information required and correctly interpreting it. Thoroughness in sticking to the job until the information desired is obtained. Initiative in using supplementary sources when full information is not found in the original source; also in getting together data that will be needed without being told. Intellectual curiosity and spirit of inquiry in obtaining a knowledge of such sources of information. Judgment in selecting the proper source.
5. Knowledge of the services rendered by information service bureaus.	5. Skill in obtaining information on specific topics from newspapers, government bureaus, railroad travel bureaus, consolidated ticket agencies, the New York Public Library, the Better Business Bureau.	5. Same as 4.
6. Knowledge of how to keep a scrapbook.	6. Skill in obtaining material for the scrapbook, in organizing the material, in inserting it, in indexing and cross-indexing, and in arranging a table of contents.	6. Desire to be of service to the employer in connection with his intimate interests. Resourcefulness in obtaining material for the scrapbook and in choosing the right kind of book. Neatness, orderliness and painstaking care in arranging the material and inserting it. Accuracy and thoroughness in indexing and cross-indexing and in arranging a table of contents.
7. Knowledge of how to prepare printed documents.	7. Skill in proofreading. Skill in editing.	7. Accuracy and thoroughness in finding all errors. Painstaking care and reliability in making all necessary corrections. Dependability in making appropriate revisions in punctuation, grammar, sentence structure, and diction of material being edited.

Knowledges	Skills	Attitudes and Appreciations
8. Knowledge of how to get travel information and how to prepare an itinerary.	8. Skill in reading time tables. Skill in using traveler's guide books or the hotel red book. Skill in making reservations at hotels. Skill in making appointments. Skill in arranging all other necessary details.	8. Accuracy and thoroughness in getting all information necessary for planning the itinerary. Judgment in arranging the itinerary so as to provide for comfortable accommodations, avoid delays, etc. Thoughtfulness and initiative in devising means for obviating the petty annoyances incident to a trip.
9. Knowledge of secretarial machine operation.	9. Skill in operating the dictaphone or ediphone, the mimeograph, the addressograph.	9. Desire to be competent and coöperative when called upon to perform duties outside of one's regular routine.
10. Knowledge obtained through direct experience.	10. Adaptability — skill in making use of the knowledges, skills and attitudes acquired in the classroom. a. In the performance of secretarial duties in the offices of administrative heads, of chairmen of departments, of grade advisers, and of others who may coöperate. b. In reporting school assemblies, minutes of meetings, radio broadcasts.	10. Appreciation of the importance of cultivating personality. Appreciation of the importance of good appearance, nice manners, a willing and cheerful disposition and good health. Appreciation of the importance of developing character. Spirit of service in doing work for which one gets no financial return. Feeling of self-confidence resulting from the growth in power to use acquired skills, knowledges, and attitudes in solving problems in new situations.

MENTAL HYGIENE SELF-ADMINISTERED

THE acceptance of mental hygiene as a social and individual beneficence has been attested by the number and the size of mental hygiene and behavior clinics which have developed like mushrooms within the past few years both here and abroad.

When a "naughty" child's inability to solve his problems rationally manifests itself in conspicuous maladjustments annoying to society, he is taken to a guidance clinic where attempt is made to bring about a better relationship between him and his environment through re-education of the former and alteration of the latter. But the "good" child, the withdrawing child, who compensates for felt inadequacies by substituting for satisfactions usually derived from toys and playmates, daydreams of admiration won by superlative heroism, or fancied adventures of equally superlative villainy or of "getting even," is permitted to continue his unwholesome conduct, and allowed to develop maladies which lead to mental hospitals, because outwardly rectitudinous, he does not thwart our purposes. Because a knowledge of themselves and an evaluation of the adjustments people make to their environment would give children a better insight into their own problems and an understanding of rational methods of solving them, and because this knowledge would go far toward preventing the establishment of behavior anomalies as fixed habits, the plea here made is for regular instruction in mental hygiene for all school children.

Aside from the so-called "enemies of society," the thieves, incendiaries, murderers, racketeers, and others, there are in the busy population on the streets, in the subways, in the stores, and in the restaurants, other extreme cases—young people who could contribute generously to society—with personalities so dilapidated that the energy they should be spending in achievement is passed in obtaining fancied satisfactions, or answering with self-inflicted punishment and reproach the imagined voices they hear thundering harsh names and threatening hell-fire and brimstone. The real tragedy is not so much the finis in hospital or suicide as the fact that an early understanding of themselves and their environment would have led to rational adjustment and useful, joyous living. These are the extreme cases, yet because of their greater incidence, the less severe are equally important. Grown women, showing by adoption of a lisp or "baby talk" their dissatisfaction with the present and their desire to be again coddled as an infant; men, uncertain of their manliness, evincing their lack of assurance by going about with a "chip on the shoulder"; wives howling for the things they cannot acquire peaceably; husbands compensating by bullying at home for felt inferiority at the office; henpecked employers "taking it out" on their subordinates—these and all kinds of unfortunate emotional outbursts and attitudes which prevent people from realizing their highest capacity in achievement and happiness are ways of meeting problems. These lower-level adjustments were *learned*, not through carefully prepared presentation by a teacher, and purposeful drill, but through the relief or satisfaction attained by accidentally hitting upon a way out, and habituation of the method by repeated application to similar situations.

Courses in psychology are regularly offered in the colleges, but by this time, conflicts unsolved, mostly conflicts with self dating back to early childhood, have too often left psychic scars of mental anguish and painful memories, of fears and worries, and vicious habits of temporarily wriggling out of dilemmas on childish levels which unfit for successful living. Besides, most pupils never enter college, and once having left the lower schools, they have neither the inclination nor the opportunity to learn those facts which would help them in making happy adjustments as sons and daughters, as employees, as citizens, and as parents.

The teaching of adequate intellectual reactions has been the traditional business of the schools. The principles of physical hygiene have been also incorporated in the curriculum; and, beginning in the elementary school, children are taught to care for their bodies, not only to obviate the necessity of medical aid, but to keep minor ailments and poor health habits from impairing their efficiency. Mental health, vastly more important, because without it the individual cannot care for even his physical well-being, is neglected until a definite abnormality develops. If no striking maladjustment appears, there still develop antagonism, disgruntled dispositions, fears of attack and defeat, self-defensive attitudes, and other unfortunate mental twists, some of which not one of us escapes, and which hinder maximum effective and happy living.

Just as regular periods are assigned to the teaching of sound intellectual and physical health habits, so should the principles of mental balance be incorporated in the curriculum. We owe it to children to make them as self-directive in this, the most important matter in the world, as we aim to make them in others. We permit them when thwarted blindly to find a way out through day-dreaming, through evasion, through self-deception, through rationalizing, through compensation, through "sour-graping," and through projecting upon others their own shortcomings, and the most we do, unless maladjustments have reached objectionable proportions, is to berate their weak solutions instead of teaching them to adjust on higher levels.

The drives that motivate mankind and their modification through social pressure; the mechanisms which lead to mental anomalies and the manner of their acquisition as habits; the importance of facing problems and themselves finding the solutions which preserve the greatest number of values,

Scanned with CamScanner

or seeking expert help; the necessity of correcting errors as soon as they are recognized; sportsmanship in disappointment; mental reservation despite necessary adherence to adult dicta; and, best of all, the function of their own efforts in speeding the time when they will be self-directive—these and many other facts could be explained in the classroom. Enough is known about childhood and adolescence to construct a course continuous through the elementary and high schools which would help children of these ages adequately to meet the problems they are experiencing, and to gradually gain power later to meet rationally more difficult situations. Such a syllabus could further embrace some of the topics usually included in the psychology of childhood, of adolescence, of adult life, of character, and in social psychology, which would give them an understanding of themselves and their environment. This does not mean that courses presented at the college level should be given in the lower schools. This, like all other subjects, must be adapted and graded.

Thus, the six-year-old lives in a world of fears. He is afraid of his parents, his elder brothers and sisters, the policeman, the dark, lightning, water, and everything he does not understand. We take great pains to teach him all about Santa Claus—how he looks, what he wears, where he lives, and how he travels, but we make no definite aim of unconditioning the fear habit which strangles his initiative and wrecks his happiness. Other situations, such as the displacement from the center of the universe by the advent of a new baby in the family, and the reactions with which children meet such situations—temper tantrums, negativism, pouting, and food fads—could be discussed, and the proper reactions could be inculcated, possibly in games set aside for mental health instruction at a definite time, so that those children who reserve these demonstrations for home consumption and whose psychotic tendencies are not detected by a discerning teacher, could profit by it also.

In the high school many children continue to be beset with fears—fear of recitations, of examinations, of failures, of parents, of meeting people, and of numberless other situations. "Oh God, let nothing happen!" was the devout prayer of one young girl as she entered a classroom. Sex worries and religious doubts are new problems, and only those who have worked with mental cases can know the extent to which these figures in aberrations. Though the psychology of sex is taught in the more advanced high schools, adolescents are not helped to meet concrete problems, and their trial-and-error solutions are fraught with much disintegrating conflict. The following exemplifies a case where help given, almost too simple to narrate, was definite and real. A. G., a girl about sixteen, showed considerable antagonism in her reactions, refused to join any school club, absented herself from parties, was unwilling, cynical, disgruntled, sarcastic, and generally unpleasant. Despite good intelligence, she was failing in several subjects. Discussion of her problem revealed a conflict between her ideals and demands that were being made on her friendship. She complained that life was ugly, and that if she wished to have the attentions every young girl craves, she must relinquish cherished ideals. After perusing suggested readings, and replacing "tête a tête" companionship with more inclusive functions, according to advice offered, she reported herself much happier, and is doing better school work. Many schools boast a dean to whom pupils can come with their problems, but the former is usually too busy with administrative work, and the latter too diffident to discuss really personal matters. An impersonal treatment of the situations which worry young people is needed. Through appropriate readings and discussions of anonymous statements of pupils' own problems, or through other methods to be discovered by experiment, revision, and further experiment, the lives of these older children could be made more tranquil and happy.

That a universal interest exists in matters dynamically psychological is attested by the curiosity people evince in each other's behavior. At the high school age, this interest has been demonstrated to the writer by the many requests received for topics to be read and used in English essays, by titles of books selected for leisure reading, and by the rapt attention given to explanations of their own behavior when opportunity offered.

The construction of a program such as is here advocated presents extraordinary difficulties; first, because a preventive approach to the problem lacks the wide empirical background supporting the therapeutic attack on adult attitudes initially responsible for children's symptoms, and secondly, because execution of such a highly technically program, if it should not deteriorate into mere well-intentioned meddling, not to say more unfortunate conditioning, demands a technically trained personnel. But "experiment is the only method in education," in this field as in any other, and eventually it must yield gratifying results.

Living conditions are becoming progressively more complex, and adjustment increasingly difficult. Guidance clinics draw only children whose abnormal conduct has become seriously manifest; behavior clinics draw only mothers who have enough intelligence to realize the value of preschool training for little children. University courses draw only a very small proportion of teachers; but all children attend school, and as all children are taught physical health, so should all children be taught the laws governing mental health. Whereas guidance as we now now have it is corrective, instruction would be preventive. The funds spent by municipalities in building larger and better prisons, penitentiaries, and mental hospitals might better be spent in education for self-direction by providing instruction at an early age for the self-administration of mental hygiene.

HIGH POINTS

Early Days, a Pageant

"Early Days," a musical review and historical pageant written by George S. Dare and given in Curtis High School this year, brought out the mellow humor, the grace, the charm, and the dignity of the beginnings of American history.

After ushers in light blue brocade and powdered wigs bowed the audience to their seats, the five-part pageant, a good deal like "Green Pastures" in construction, was unfolded. Historical and poetical prologues, delivered by a boy and a girl, welded the parts together. There was no scenery, soft curtains or screen; costumes and changing lights were the setting for all the parts. Part I, Scene 1, disclosed squatting bronzed Indian chiefs smoking the pipe of peace. A wounded brave carried by his fellows introduced the Medicine Man ceremonies which, to the accompaniment of a quickened beat of the tom-tom and Herbert's "Dagger Dance," passed into an authentic American Indian dance, the Wolf Dance. Cadman's "From the Land of the Sky Blue Water," Lieurance's "By the Waters of Minnetonka," and the Maliseet Love Song, sung by an Indian brave in the moonlight to his silent girl lover, impressed the audience with the beauty and restraint of an Indian wooing.

In Part II the two side aisles of Feldman Hall were used to introduce the pioneers and settlers. Preceding the exchange of gifts between the Indians and Henry Hudson's crew, the orchestra played the Holland National Hymn. The curiosity of the Indians aroused by the costumes of Hudson's men gave way to awe as Father Marquette, holding a rude wooden cross, approached the stage. The "Te Deum Laudamus" of the Jesuits died away to Croft's "O God, Our Help" which led to the meeting between the Indians and John Smith's gayly dressed English ladies and gentlemen. A spotlight directed down the hall lit the bowed heads of a band of Puritans as they advanced to MacDowell's "A. D. 1620," "lining out" "Old Hundredth" when they reached the platform. Accompanied by MacDowell's "From an Indian Lodge," the Indians in pantomime closed their friendly dealings with Europeans by giving to William Penn and his followers the "land beyond the river."

Part III reflected the settled life in the colonies. In Scene 1, two Puritan women sang "Mear" as they did their kitchen tasks, once in a while gently rocking the rough cradle. Scene 2 depicted life among the slaves. Old "Grampa" quavered "Carry Me Back to Old Virginny" as he slowly crossed the stage strumming on his banjo. Two woolly headed pickanninies who had wiggled their way out from between the curtains vied with one another in contorting fingers, arms, and legs and later cautiously, to the tune of "Old Zip Coon," followed the loose jointed dance movements of two older slaves, the whole scene ending with the Negro spiritual, "Deep River." Scene 4 revealed the color and charm of a Southern gathering at Mount Vernon. The younger set danced the minuet while chaperons gossiped. Francis Hopkinson sang his "My Days Have Been So Wondrous Free"; Nellie Custis followed with "Nora, Dear Nora"; the scene broke up with a joyous Virginia reel to the tune of "Up and Down."

Part IV gave the audience the spirit of '76 with the beating of drums for recruits, the singing of "Yankee Doodle," the talking in hushed whispers on an almost darkened stage. The reading of the last lines of the Declaration of Independence came next, followed by the silent signing of grave gentlemen seated and standing about a table. The opening curtains then disclosed Lord Howe pacing back and forth in the Billop House and his fruitless conference with Franklin, Adams, and Rutledge. Scene 4 was opened by the night watchman's bell and his cry of "All's well" to groups who talked in whispers that rose to shouts when came the news of the battle of Yorktown. "The President's March" was a stirring close. "See The Conquering Hero Comes" accompanied the drawing of the curtains upon the next scene, George Washington repeating the oath of office in New York. "Old Glory Passes By" and two stanzas of "America," the latter sung by the audience, closed the pageant.

The high seriousness and the finish of this production were the result of the whole school's working as a unit. The art department was responsible for costumes; the English department for acting and lighting; (and not the least important were the actors behind the scenes, the "lights" boys); the music department for vocal and orchestral music; the physical education department for the dances. Many among the audience caught what the teacher of adolescents often experiences in serious class discussions: the sincerity and the idealism of the younger generation.

HELEN J. BURROWS.
Curtis High School.

Stenography and Typewriting As Cultural Tools

Has it occurred to teachers that stenography and typewriting are not only vocational and utilitarian occupations, but that they relate to a cultural economy and equipment and that they can be so treated? Do they know that teachers can appeal to the inherent curiosity of our young people, their interest in solving problems, their constructive and imaginative propensities in teaching these subjects?

We can relate these subjects to other subjects in the curriculum and make them useful in acquiring other subject matter. Just as good spoken English is a desideratum in all classes, we can find ways of using shorthand and typewriting in other subjects; also in extra-curricular activities, clubs, and home and community affairs.

Scanned with CamScanner

Educational experiments have demonstrated that pupils who typewrite their spelling words or arithmetic examples do more accurate work than the handwriters in these subjects. Undoubtedly, to require that English essays be typed will result in better essays; and to require history outlines and science observations to be typed, will result in better organization and understanding of the material. We may depart somewhat from the stereotyped procedure of copying letters, bills, tables, and the like, and allow our advanced pupils to do more typing of reports assigned to them in other school departments. Shorthand note-taking can be encouraged in the social science classes. In other words, the cultural and personal value of shorthand and typewriting can be more stressed than it has been in the past.

Before a general education was considered the birthright of every person, handwriting was a vocation; in Rome, the vocation of slaves; in the Middle Ages, the vocation of clerics. To a large extent, stenography and typewriting have occupied an analogous utilitarian position. I believe stenography and typewriting have passed the utilitarian milestone and can be considered a general educational accomplishment just as handwriting is and which they are in a high-speed machine age displacing in a large measure.

The foregoing suggestions for extending the scope of the work in shorthand and typewriting are by no means exhaustive. A larger study of the possibilities will have to be made both for general and local application.

H. J. NEWMAN.
Theodore Roosevelt High School.

Children's Questions in Biology

In an article entitled "Functional Biology" appearing in the February, 1932, issue of HIGH POINTS, the writer reported a number of "big-ideas" or major objectives in biology which were obtained from an analysis of the writings of specialists in the field. It was then suggested that an evaluation of these big-ideas ought to be made on the basis of the interests of children about to begin the study of biology, as evidenced by their questions. This has been done and the following is a report of the results.

The following questionnaire was submitted to 955 eighth-grade pupils, 455 boys and 500 girls:

BOYS AND GIRLS:

You are soon going to study biology, which deals with the activities, description and inter-relationship of living things. As you know, all living things are divided into two groups: *plants* which consist of roots, stems, leaves and flowers, and *animals* like insects, fishes, frogs, snakes, birds, fur-covered animals and *human beings*. You must have wondered a great deal about these different forms of life and undoubtedly have a number of questions about them that you have never been able to get answered. Your biology teacher would like to know these questions so that he might arrange to have them answered for you. Will you please write your questions on this sheet of paper.

Name .....
Age .....yrs. .....mos. Sex { Boy / Girl

In response to this questionnaire, 4,595 questions were obtained.

Range in the Number of Questions Asked

Boys	0 to 13
Girls	1 to 26

Average Number of Questions Asked

Boys	4.91
Girls	4.40

An analysis of these 4,595 questions showed that the children were much more interested in animal life than in plant life or in the human being. The following table lists the frequency with which questions were asked about the groups into which they may easily be classified:

Group	*No. of Questions*
Plants	991
Animals	2,368
Man	769
Miscellaneous	377
Non-biological	90

The miscellaneous group included questions about diseases without reference to any particular organism, evolution, investigations and discoveries of biologists, the history of biology, and so forth.

The group of questions asked about animals was further analyzed to determine the group of animals in which the children were most interested with the following results:

Group of Animals	*No. of Questions*	*Total*
Invertebrates	.....	448
Insects	365	.....
Worms	58	.....
Others	25	.....
Fish	489	489
Amphibians (Frog only)	78	78
Reptiles	.....	339
Snakes	319	.....
Others	20	.....
Birds	384	384
Mammals	391	391
Animals (Not specified)	239	239
	2,368	2,368

Conclusions: Children will ask questions about those situations and problems which have challenged them and are valuable in the evaluation of the big-ideas in biology, in that they come out of the direct everyday experiences of the children. To use these questions for this purpose is important, but to depend entirely on them is faulty, for an item ranked among the lowest ten may receive such a rank, not because of lack of interest in this item, but for one of two other possible reasons: (1) A limited experience which has not given the pupils a sufficient knowledge or background to enable them to ask questions, or (2) they may not feel the need to ask about certain things because of an enriched experience which has given the pupils a complete knowledge.

Scanned with CamScanner

The results of the tabulation of the frequencies of questions asked which could be answered through the development of the generalizations in biology point to some very definite conclusions:

A. There is a marked interest on the part of pupils in the following, in the order in which they are listed:

1. The difference in structure, function and habits of living things.
2. The adaptation of structure to function and function to habitat.
3. The struggle for existence and the devices for preserving and continuing the race.
4. The necessity for, the process, and the results of oxidation.
5. The methods of obtaining oxygen by living things.
6. The ability of the organisms to respond by growth, movement, or in some other way to external stimuli.
7. The process of assimilation and growth.
8. The methods of obtaining food and shelter by living things.
9. The methods of reproduction in the higher forms of life.
10. The contribution of scientists to the knowledge of the causes, prevention and treatment of diseases.

B. That there is either a lack of interest in, a complete knowledge of, or an insufficient background in the following:

1. Heredity in plants and animals and the study of eugenics and euthenics in the human being.
2. The fact that bacteria are vital to agricultural processes and beneficial to man in other ways.
3. The fact that reproduction may result in variation.
4. The fact that living things are dependent upon other living things directly or indirectly (symbiosis, parasitism and saprophytism).
5. The phylogenetic development of organisms and its significance to the evolution theory.
6. The psychological effect of worry and unpleasantness upon the activities of the human being.
7. The geographic distribution of organisms and the evidences which it brings forth in favor of evolution.
8. The definite relationship which exists among living things.
9. The value of muscular exercise upon the tone of the muscle in developing respiration, improving circulation and stimulating digestion.
10. In the vocational and avocational possibilities that are influenced by biology.

A large number of the questions were asked which showed that the pupils were influenced by superstition and prejudice or were in error concerning the true facts. The following list of questions are a few which led to this conclusion:

1. Is it true that cats have nine lives?
2. Why have spiders five lives?
3. Do worms remain worms throughout their lives?
4. Why is it that a she-rubber plant loses some of its leaves and a he-rubber plant does not?
5. Why does the evergreen die in the summer and live in the winter?
6. Why do dogs turn around before they lie down?
7. Why is it after a rain you will always notice snakes on the ground?
8. Do milk snakes suckle cows?
9. Why has the snake so many feet?
10. How does a plant breathe in carbon dioxide and breathe out oxygen?
11. Why is it that polar bears have fur and seals haven't?
12. Does a person get black when he is in his grave?
13. Is it true that the more strength a person has the more hair will be grown on his body?
14. Does a drowning person really come up three times?
15. Why do Chinese people eat less than white people?
16. Why do goldfish live longer when you don't feed them?
17. Has a shark little pilot fish in his eyes?
18. How long can a whale stay above water?
19. Why aren't dogs supposed to eat much meat?
20. When a horse breaks a leg, why can't it be mended?

A very great interest was evidenced by the large number of questions inquiring as to the ability of living things to speak to one another. Sample questions follow:

1. Why can't animals talk?
2. Do animals talk to each other in their language?
3. Why can't every person understand an animal?
4. Do fish use languages?
5. How is it that monkeys can talk?
6. Have animals any knowledge in their world?
7. Have animals any way of speaking?
8. Do animals understand each other?
9. Do plants have any way of communicating with each other?
10. Do bears have a language?

A number of questions were asked about the processes and mechanics of thinking and dreaming:

1. Have plants and trees the power of thinking?
2. What causes people to dream?
3. How does man think?
4. How do our minds work?
5. What controls our minds?
6. What is the mind made up of?
7. Why do we dream?
8. What part of the brain controls memory?
9. What are dreams?
10. Do other mammals dream?

The above analysis suggests two types of instruction: (1) for the purpose of answering the questions of the pupils, thereby satisfying their curiosity and giving them a back-

Scanned with CamScanner

ground for the purpose of further learning, and (2) remedial instruction for the purpose of correcting errors and reducing prejudices and superstitions.

The evaluation of the big-ideas on the basis of the questions asked by pupils is significant. However, there must be further evaluation on the basis of other valid criteria. It is suggested that an evaluation on the basis of the types of biological material that appear in the public press might prove valuable. It is hoped that this may be done.

BENJAMIN T. DIAMOND.

Samuel J. Tilden High School.

Secondary Education at the Cross-Roads

Discussions of secondary schools in our educational system have recently been in progress at Teachers College. A *New York Times* editorial states that "the secondary school is not even beginning to be what it might be in return for the public investment." The secondary schools must now either justify their existence or be remodeled. However, we must be careful as to our methods of evaluation, for some of the values are difficult to appraise. Far more important than the mastery of the specific subjects is the mere presence of the youth in the high school for four years, since here character is molded.

Two considerations are warranted. First, since we live in a capitalistic world we must pay for this instruction, which is expensive. No one cares to expend money without determining the full value to be derived, and although character molding is important, one must also determine the value of each subject of the curriculum and whether new subjects might not well be added or even substituted for many of the existing ones. No new idea is here conceived when it is suggested that we test our graduates of, say, one, five and ten years ago with the very Regents' examination they took when students in the high schools. The results obtained from these tests would tend to keep uppermost in our minds the great loss of content due to failure of memory. Also, we might test the value of the courses by the practical use made of this background, not alone in business, but in daily conversation and in articles read in newspapers and periodicals.

Secondly, one questions the value of this character training for use in later life. Do not our eminent educational authorities claim these schools to be secular cloisters in which the aim is to instill into the youth proper habits, thoughts, acts, morals, ethics and regard for his fellow-man? Is this practicable? Should we rather not teach the pupil to prepare for life according to the standards which exist in business, in fact, in life in general?

Should we not institute a course which would show the corruption in political life in our cities, states and Federal Government, not confined to the underling, but to include the official in high station? Should we not emblazon in the text-books the chicanery of financial houses, not only bucket shops, but the ones who are members of the most well-known exchanges? Should we not point to dishonesty in all forms, to the business transacted by the parents of the pupils being taught and ask these pupils to offer illustrations in tomorrow's lesson from their personal experiences? Should we not produce evidence of the dishonest statements rampant in social relationships, not confined to associates, but extending to friends and relatives, even to our own homes? Would it not be advantageous for our youth to point out the many ways our laws are circumvented? Also, should we not be more candid in the expression of our bigotry and in the rationalization of our prejudices and our intolerant dogma, not alone in religious, but in racial and political acts?

Such a course of study as outlined above might well include a subdivision on manners and mannerisms. In our present society it is necessary to acquire a suavity and polish so that one's motives be dissimulated.

The above paragraphs would seem to indicate that the author is whimsical, but he is all too serious. He believes that if this is life in its true colors, then our pupils should be properly equipped for it and should not be required to unlearn in a few years that which took four or more years to imbibe. Or, perhaps, the pupil has never learnt what we teach of character training, but merely mouths our "aphorisms," knowing full well that they are only for school consumption.

But possibly this course is too pessimistic. No chance for spiritual advancement is offered in such a decadent society. Is there no escape, no other path to pursue in the guidance of our new generation? The only other one available is to set our house in order. Let it be a proper model for our young ones to live in and build upon. In short, if we desire that our youth have confidence in us, we must not only institute in our schools a definite course in ethics and morals tending to cultivate a "responsive social outlook," but we must in our daily life live up to this program, play the game. Thus, only, can our civilization rise to an ever higher plane.

MILTON G. WOLF.

James Madison High School.

Free Composition in French

In my opinion, the most difficult topic to teach in French is composition writing. The problem is an entirely different one from writing compositions in English. Because of their superior knowledge of English, students can say much more in that language than in French. Most pupils have the tendency to translate their English thoughts into French. The result is that the compositions are full of mistakes and the French sentences are merely English sentences with French words. The problem is, therefore, a most difficult one unless we bear certain things in mind. The teacher must guide the pupil very carefully, so that he avoid pitfalls.

The teacher must realize that we cannot teach composition, idioms,

Scanned with CamScanner

translation, dictation and comprehension as separate topics, because they are not divorced from each other in any respect. Let us suppose, for instance, that we have to teach composition to a sixth-term class which has never written any free compositions. The pupils know nothing about writing compositions, of course. It is up to the teacher to teach how to write. The instructor picks out a topic that the pupils are to write upon. For example, at the beginning of the term, I listed a number of themes that the pupils were to write upon during the course of the semester. I picked out ten themes. The themes to be written upon must be alive, and must be connected with the daily life of the pupils; otherwise they are dull and uninteresting. At the beginning of this term, when the pupils were back from their summer vacations, I chose this theme: "Les grandes vacances." Two weeks later, when all the programs of the students were adjusted and the work of the term in full swing, another topic was chosen: "Les études à l'ecole." A week or so later another composition was chosen: "Une soirée à la maison." During October and November the students are greatly interested in winter sports. This fact suggested another theme: "Les sports d'automne et d'hiver." In short, I try to pick out a theme which at the time will interest the pupils. The fifth composition which I have in mind is an entirely different one from the others: "Mes amis et moi." For the rest of the term I have listed these topics: "Un livre que j'ai lu"; "Un spectacle intéressant"; "Les vacances de Noël"; "La ville où je demeure"; "La maison où je demeure"; "Ma dernière classe de français."

On mimeographed sheets prepared especially for them, the pupils are given all the material needed to write a good composition. Let us pick out one of the compositions and see just how to present it to the pupils. The theme chosen is "Mes amis et moi."

I arrange for five exercises. The first exercise is listed as "Etudes de mots." I list a number of words in this exercise such as *camarade, le signalement, nez aquilin, taille petite, moyenne, grande, drôle, brave, yeux bleus, cheveux blonds, cheveux châtains, cheveux coupés, ondulation permanente, cheveux frisés, sourcils noirs, chez moi, chez eux.* I shall not trouble to suggest more words. All are words which the students need. The student must have the tools to work with, otherwise they cannot write. The instructor must bear in mind the idioms that are required during the third year course in French and incorporate them in the composition. Of course the instructor must choose only those idioms which the student can use in the composition. Any idiom which does not naturally fit in with the composition should not be chosen. If an idiom is taken out of its milieu it means nothing. I therefore list in the next paragraph about twelve idioms, half of which the students are already familiar with, such as *faire la connaissance de, penser de, penser à, compter sur, avoir l'intention de, avoir envie, tenir à, tenir de, s'amuser bien, avoir les cheveux châtains, passer une soirée des plus agréables.* Naturally, it is essential to drill the students on those idioms with which he is not already familiar.

We are now ready for the next exercise—questions to be answered in French. It is understood that the instructor must bear in mind the ultimate objective of the exercises—the writing of the free composition. The questions are selected with care. The words of the "Etudes de mots" and the idioms in the next exercise are incorporated in the questions and in such an order that all the answers in order form a composition. There need be no more than twenty questions of this type: *Comment s'appelle votre meilleur ami? Quel âge a-t-il? Où avez-vous fait sa connaissance? Quel est le signalement de votre ami? Quand pensez-vous à vos amis? Sur qui comptez-vous quand vous avez une soirée chez vous? A-t-il envie de s'amuser bien chez vous? Avez-vous passé une soirée des plus agréables? Pourquoi aimez-vous vos amis? De qui tient votre ami?* The answers of the pupils will of course be different so that the compositions are not the same.

The next exercise may be omitted at the discretion of the instructor—the exercise from English to French. Even in this exercise the instructor must bear in mind that the ultimate objective is to write a composition. The sentences in this exercise in order will also form a composition. Repetition is very important in the process of learning. The next day assign the students the composition to be written at home. It will take them no more than fifteen minutes. Four pupils are sent to the board and their compositions corrected. Those who have not put their work on the board will be able to correct most of their own errors by looking carefully at the board. The mistakes that pupils make are of the same type and it is comparatively easy for them to make corrections. One or two days later the pupils are asked to write their compositions in class. They are allowed to consult nothing while writing. This last exercise takes no more than ten minutes. Of course when you collect this last exercise it must be corrected and handed back to the pupil.

I know that some will think that this work takes too much time. I have tried this method and found out that such is not the case. The first composition and perhaps the second will have many mistakes, but with each succeeding composition the pupils will make less and less mistakes. The exercises need not be given all for the same day. A little each day and we have a composition. As an additional exercise, read a well prepared dictée, which is just another composition under the same theme.

What is accomplished while teaching the pupils to write compositions in French? The students learn new words, the dictation gives oral and aural practice, idioms are learned in the proper way, and the translation from English to French gives grammar drill. Then when the pupils write the composition they must keep their

Scanned with CamScanner

eyes open to make sure that adjectives agree with nouns, that the subject of a verb and the verb are of the same number and person, and so forth. Of course the compositions are not all written in the same tense. This shows the pupils how to use tenses correctly.

The instructor is the guide of the students. Unless he shows them how to write they never will learn.

THOMAS J. DE LELLIS.

Evander Childs High School.

The Art of Reading

In placing reading first among the three R's, the framers of the immortal phrase intended, I am sure, to express at once their personal preference for the subject, and their belief in its value in the curriculum.

Here at Theodore Roosevelt High School, with the same patent partiality, four of the ten uniform lessons that open the term's work in English are devoted to the art of reading.

The first of these lessons is on the use of the library. Anticipating the needs of the pupils, the English teachers devote a period early in the first week of the term to an explanation of the arrangement of books, the use of the card catalogue, and the reference facilities of the library. Even though newcomers to the school will be given a lesson later on by the school librarian, teachers of the first grade feel they should themselves initiate first termers into the mysteries of a library. In the lower grades, the simpler facts about book arrangement are stressed, for these children seem to know but one answer to the problem of finding a book—"Ask the librarian!" In the upper grades, more difficult problems are discussed; some teachers hand out cards with questions requiring the use of reference material, and conduct the class to the library to explore until the answers are found.

The second of the lessons designed to encourage reading is the one on the idea and method of leisure reading. On the day for this lesson pupils receive their lists for the selection of the monthly book for outside reading—one book of fiction, one biography, one play, and one book of poems. Dates are assigned for the completion of each book. Once more, instructions may be given on how to find each type of book on the library shelves. A check on library cards is made, to be sure that the facilities of the library are really at the command of each pupil. On that day, too, I encourage the pupils to discuss freely their reading habits. When the bold confession is made," I don't like reading!" I recommend one of the easier, shorter books on the list, perhaps one that will lure the boy or girl with its humor to the field of reading. Another pupil may express a preference for the cheap novels that find no place on the list. At first, shocked by the audacity of one who ventures an opinion contrary to the one that teachers want, others in the class soon confess to a similar preference. Then I try to flatter these candid pupils into a state of willingness to try something better suited to their ability, and better worth their time.

From some other pupil, if possible, I try to obtain some statement of the differences between good and bad books, in character delineation, originality of plot, value of thought. One enthusiastic reader in the class can fire a dozen others with a desire to read books that are worth lingering over and remembering.

The third of the lessons is on magazine and newspaper reading. Some teachers have the pupils buy a particular one, and study it in class with the aid of the teacher. Others have a discussion of the favorite magazines and newspapers, with an attempt, of course, to win the pupils away from the poorer type of magazine or newspaper. Once more, the idea of worthwhile reading is stressed, and through flattery or example, the pupils are induced to read those preferred by educated adults.

The last of the lessons is on silent reading. The rules are given for reading without lip or finger movement, for speeding the rate of reading by occasional skipping of unimportant words and by constant anticipation of the writer's thoughts. A test is usually prepared on a passage from a book, magazine, or newspaper. In most cases, the mark received will show a definite correlation with other marks as the term's work progresses.

At the end of the first two weeks of the term, then, every pupil in every English class in the school has heard and participated in four discussions of reading and matters related to that art. All have been led to the fountain; during the remainder of the term some will drink deeply, others lightly, but at least all know of the existence of the fountain!

ETHEL K. HARTE.

Theodore Roosevelt High School.

Clio Visits Euterpe

Is history only the record of dynastic wars, political intrigues, and legislative enactments? The modern historian answers emphatically, "No!" Dynasties vanish, politicians fret, fume, and are gone; laws are forgotten on statute books. A Tanagra figurine survives to tell us of the grace, charm, and coquetry of the Greek woman. A line of Sappho's proves stronger than the Athenian navy. An ivory bed found in an Egyptian tomb discloses to us the state of the arts in a kingdom of long ago. Manhattan's towers may be shattered as a new world dances to a descendant of the "St. Louis Blues."

The newer historian realizes the value of cultural history, yet too often allocates to it a chapter or two, extraneous to the text, and possessing no vital connection with it. The average high school teacher, called upon by the new conception of history to teach about David and Ingres, Scarlatti and Haydn finds himself repeating names of artists or titles of creative works with which he is wholly unfamiliar. His carefully prepared training period has not included these highly specialized fields. He feels a bungler, and too often contents himself by passing out mimeographed sheets containing lists of names in cultural history, which may appear in the next series

Scanned with CamScanner

of State examinations. The magic names of Mozart and Monet are memorized like so many chemistry formulas, only to be forgotten the next day. The purpose of introducing to students great writers, artists, and musicians is to enrich their lives by familiarity with aesthetic beauty. How to achieve this purpose without throwing an impossible burden on the history teacher, is a grave problem. We have tried to solve it in the field of music by the experiment described in this article.

In New Utrecht High School modern European History is given in the fourth and fifth terms. During their third term at school students may elect as a half-unit, a half year of general history. The half-year covers, of course, not merely ancient history, but the story of western civilization to the French Revolution. We have always felt that the students would be better prepared for understanding the difficult problems of modern European society if they began the work with a firm grasp of the cultural background of the great European nations. A large part of History A, therefore, should be devoted to cultural rather than political history. To realize this, five correlating lessons were planned by the history and music departments of the school. These lessons were given in the weeks assigned to the class room study of the lesson units. The units were:

I. *The Church Era*

Ascendancy of the Church—Gothic Architecture—Literature of the Middle Ages—Music of the Early Church Era—Recorded Music of the Early Church Era—Luther and the Reformation—Bach and His Influence on Church Music—Records of Music by Bach.

II. *The Classical Period*

Ascendancy of Sovereign Power—Court Life—Literature of Eighteenth Century — Mansart and French Architecture—The Classical Period in Music—Recorded Music of Monteverde, Lully, Handel, Haydn, Mozart.

III. *The Romantic Period*

The Industrial Revolution and the Rise of the Middle Class—The French Revolution and the Triumph of the Bourgeoisie—Romantic Literature—Romanticism in Music—Recorded Music of Beethoven, Schubert, Schumann, Mendelsohn, Chopin.

IV. *Realism and Impressionism*

Literature and the Great Victorians—Zola and the Realists—French Impressionism—Nineteenth Century Music—Recorded Music of Strauss and Debussy.

V. *The Machine Age*

The Contemporary Scene in Newspapers and Periodicals—The Modern Theatre—Cubism—The Skyscraper—Dreiser, Lewis, Anderson—Recorded Music of Stravinsky and Gershwin.

Three classes were selected for the experiment. Two of these were History A classes and one was a class in first-term European History. These three classes reported to the music room instead of their regular history room, once each week, for the duration of the experiment. In preparation for the correlation lesson in the music room, class projects were carried on. I shall illustrate the method used from the "Church Era," since other units were similarly treated. The class divided itself into groups under leaders. One group worked on Gothic architecture, another on literature, another on the Reformation, and so on. The library coöperated by placing on reserve such books as Henry Adam's "Mont St. Michel to Chartres," "Aucassin and Nicolette," "The Little Flowers of St. Francis," "Tristan and Yseult," and Preserved Smith's "Martin Luther." The library also displayed prominently attractive colored posters of knights and tourneys and ladies gay, of flying buttresses and Gothic towers. Each group reported on a given day to the class, telling within a time limit of five minutes the naive and charming tale of the "Wolf of Gubbio," or sketching on the board the pointed arch, the trefoil and the rose window.

When the classes reported to the music room, they were familiar with the spirit of the cultural epoch as expressed in its architecture, its painting and sculpture, and its literature. Mr. Ehrlich, chairman of the music department, then integrated these with the music of the church, so that the unit became part of the mental background of the student. Music, art, architecture and literature were treated as the outward, physical manifestations of an inner working of the spirit which set this cultural epoch apart from all others.

If each cultural epoch in its transition from growth to maturity to decay is illumined by a soul-feeling peculiar to itself, which informs all its institutions, æsthetic, political and economic, just as the soul illumines the physiognomy and actions of an individual from youth to old age, then we can by a sympathetic attempt at apprehension of this soul-feeling understand more nearly through this unifying principle why one age paints madonnas and another simpering shepherdesses, or why serfdom was as natural to one period as the factory system to another.

To continue the illustration from the "Church Era" unit, Mr. Ehrlich began the lesson in the music room by placing on the board a quotation from Romain Rolland: "The political life of a nation is only a superficial part of its being; in order to learn its inner life, the source of its actions, it is necessary to penetrate to its very soul, by way of its philosophy, art, and its dreams." The method used mainly was the Socratic. The students commented on the above statement. Then the name of St. Ambrose, Bishop of Milan, was written on the board, to be followed by the recorded playing of an Ambrosian chant. The students identified Pope Gregory the Great, before listening to a Gregorian chant. The first attempt at harmony, the Organium Discant, followed. By now the students were ready to list adjectives descriptive of church music. We elicited "devo-

Scanned with CamScanner

tional," "austere," "formal," "dignified," and "spiritual."

The following hymn was on the board:

Ut queant Laxis, So that your servants

Resonare Fibris, May be able to sing

Mira Gestorum, With relaxed fibres

Famuli Tucrum, The wonder of your deeds

Salve Polluti, Remove the guilt

Labri Reatum, Of sullied lips

Sancte Johannes, Saint John.

The recorded hymn was played. The students accompanied the phonograph, and noted that each line began a tone higher than the preceding line. The name of Guido D'Arezzo was then introduced and the pupils saw how Guido, by adopting the first six syllables of the first six lines, gave us the names for the notes of the scale.

Mr. Ehrlich introduced the word "polyphonic" to the class. A classical student gave the translation, "many-voiced." Palestrina and Lassus records were then played, and as the students listened to these, they clearly perceived that these two men had brought the art of Catholic music to a high polyphonic development.

A few brief questions on the Reformation led up to Bach. The "Toccata and Fugue in D Minor" followed. The students listened for each new voice as it joined the "handicap race," that is, the fugue or flight. The students then discussed:

"It is only an accident that Bach was a Protestant. He belongs in the great tradition of Catholic music."

We found this first unit rather long and were forced to assign two lessons to it. It could easily, of course, be split into medieval and reformation units.

The day following the trip to the music room a short examination was given in the history room. This is the test on the Church era.

Appreciation

I. "The copying of all chants was in the hands of monks, who not only preserved the music of the Middle Ages for us, but also invented our present system of notation."..... From your knowledge of our present staff and clef signs, substantiate the statement crediting the Church with the invention of musical notation.

II. The statement has been made that the Middle Ages contributed nothing of permanent value in the field of literature..... Prove or disprove this statement by referring to the merits or faults of one specific piece of medieval literature talked about this term.

This test was useful since it prevented the period in the music room from degenerating into an "off" period. Instead of being an interruption of the regular work of the classroom, it formed part of the term's work, to be assimilated and checked up as such. The students, however, had the benefit of being instructed by an expert in the subject, in those fields which were outside the province of the history teacher.

If ever the cultural features which we are today seeking to incorporate in our history teaching are to constitute more than lists of names, memorized but to be forgotten, some such

Scanned with CamScanner

correlation as here outlined between the various departments of the high school will have to be arranged. In European history, we list leading scientists and their achievements. surely the physics and chemistry men could help us here. Cézanne, Renoir, Matisse are to most history teachers alien names. We are not competent to do more than categorically list great musicians, novelists, and artists. Yet within the building, artificially separated by departmental and administrative walls, are trained people, competent to help us present a learning unit, as a living whole. Only then can the rattling skeleton of dry facts be clothed with flesh and imbued with spirit, and the study of history become a guide-post to the living of a full life. We submit our experiment in the correlation of history and music as at least an attempt in the right direction.

M. HERSCHKOWITZ.

Teachers' Conferences at Abraham Lincoln High School

Teachers' conferences with the principal are usually of the most ordinary nature where general routine and administration notices are read.

In order to avoid this monotonous and uninteresting situation, the conferences at the Abraham Lincoln High School have been made alive and educational. A committee was selected to draw up topics for discussion at three meetings this term. These topics are discussed by two chairmen at the Chairmen's Conferences and papers are read by two teachers and the topic discussed at the General Conferences. All teachers are notified in advance of the question under consideration.

The three topics selected for this term are the following:

1. How can we, as teachers in the classroom, develop the personality and power of our pupils through the formation of good habits, the stimulation of interests, the cultivation of tastes and the development of a sense of responsibility?
2. How can the administration and the teachers make full provision for individual differences among the students?
3. To what extent should athletics be encouraged in our school?

In this manner teachers are awakened to the large, broad problems of education encountered by the administration, and are made to feel that they are invited to offer ideas on the solution of the respective problems. Teachers realize that there is something besides ordinary classroom work in the broad features of education.

Abraham Lincoln High School.

Clinton Character Cards

DeWitt Clinton High School has instituted this term a new system for the rating of character. It is the purpose of this article to describe that system in the hope that it may prove of use elsewhere.

Prior to the present term the so-called "Citizenship Rating Plan" was in use. When a teacher entered his final marks on the term sheets he appended an exponent—E for Excellent, S for Satisfactory, and U for Unsatisfactory. These were transcribed to the student's record card.

In the hope of improving upon this scheme, work was begun by a teacher committee known as the Character Development Committee. This committee was appointed by Mr. Clark, the principal, and was under the chairmanship of Mr. Jack Ballas. After a term of deliberation a plan was drawn up by Dr. Joseph Loretan and presented to the faculty. Although Dr. Loretan's scheme was not adopted, the lively discussion which followed brought forth the suggestion that individual cards be used with items to be checked. From this suggestion came the present concept of the character card described below.

A facsimile of the card is presented herewith. The top of the 3″ x 5″ card contains various items to insure identification of the student: Name, Address, Class, etc. The body of the card has space for description of an incident. There are no items to be checked. At the bottom there is a space for the teacher's and the student's signatures. The date of birth is added to make identification certain.

Whenever a teacher observes an incident which throws light upon a student's character or personality, he may fill out a character card. Only a brief description is necessary. The incident may be commendatory; it may be disciplinary; it may be of a general nature. The cards are kept by the chairman of the department until the end of the term. At that time they are returned to the teachers for reconsideration—cards may be destroyed or new ones added. Those that the teachers finally hand in are sent to the

general office where they are filed in alphabetical order. When a boy graduates the cards that pertain to him are permanently placed in a dead file and stamped with a number which is placed on his record card. This facilitates use for future reference purposes.

Those students accumulating a number of favorable cards are commended. Conferences are held with pupils receiving a number of disciplinary cards and an attempt is made to "cure" the condition before the student gets himself into a more serious predicament. It should be noted that not all students receive cards. In fact, it is anticipated that teachers will probably comment on only five per cent of their pupils.

There is intense activity in educational circles at the present time in the field of Character Education. A great number of problems still remain to be solved. The very nature of Character is one such problem. Recent psychological studies have tended to discredit the use of general terms in describing character. It is for that reason that the Character Cards call for specific incidents rather than general remarks. When the Principal is called upon by the Character Committee of the Bar Association to comment upon a boy's character, it is much more accurate to consider specific incidents than to juggle blindly with vague generalizations. It is far fairer to the boy to jot down his boyish prank than to call him, "Wilfully Disobedient." It is better to write "Charles copied Example 4 on the mid-term," than to say "Gross Dishonesty." It is more accurate to note, "John returned a purse containing $20," than to gush, "Very excellent character."

In order to inform the boy of what is said about him space is provided on the card for his signature. It is possible that in some cases of adverse comment a student may refuse to sign a card. In that event, the teacher is asked to hand in the card without such signature but with a notation as to the refusal.

At first thought it might seem that should a student once secure an unfavorable card it would tend to seriously prejudice his future standing, inasmuch as the card is permanently filed against him. First, it should be noted that the card is not filed by the teacher until the end of the term; both the pupil and teacher have a long cooling-off period. Secondly, the boy has his entire school career before him to secure commendatory cards. Thirdly, the person administering the scheme has sufficient judgment to realize that a student who errs once or twice in four years is probably of satisfactory character.

It is conceivable that a student may graduate without ever having secured a single card. Such a pupil is apt to be a rather colorless individual. He would, however, be given a satisfactory rating, with a comment such as, "There is nothing to mar his record."

In substance, the scheme above outlined really provides a clearing house for intimate character data about the pupils. Cards will be filed by subject teachers, section officers, disciplinarians, the psychologist, the nurse, directors of clubs, directors of the service league, etc. Not only will favorable and unfavorable comments be made but also those of a general nature having some bearing on the personality of the student—home conditions, psychological observations, and the like.

The scheme, it is hoped, will have all the advantages of a clearing house. It will make possible accurate recommendations to the Bar, Arista, and employers. It will be useful in the discipline of the school. Above all, it is believed that it will be more than a mere recording machine: it is designed to serve as an incentive to the good citizen and as a remedial device for the non-conformist.

As the above system is used it will probably evolve and change. Non-essentials will be eliminated and the substantial elements will remain. The writer realizes that schemes comparable to his may be in use elsewhere. To help hasten the process of evolution, he would be grateful if readers acquainted with similar systems would communicate with him.

EDWARD J. BERNATH.
DeWitt Clinton High School.

Small Shorthand Outlines

Teachers of shorthand who believe that the size of stenographic notes has a bearing on the speed of writing will find the use of quarter-inch graph paper an invaluable help in establishing the ability to write small outlines. Insistence on "one outline to a box" insures not only the writing of small outlines, but a regular, fluid movement, with more words on a line and a consequent increase of speed, not only through the writing of shorter strokes, but through reduction of the number of times the hand must be drawn from the end of one line to the beginning of the next.

Further, explicit instructions concerning the arrangement of homework results in uniformity in the appearance of the assignment which facilitates the location of any part, and the checking of the quantity.

Pupils have a tendency unconsciously to frustrate the purpose of this paper by beginning outlines in the middle of the box and running over into the next one, but a word of caution when the paper is first introduced will inhibit the establishment of this practice.

The Coöperative Store at the Julia Richman High School is obviating the difficulty pupils seem to have in procuring the quarter-inch size box by purchasing quantities of twenty-sheet packs and re-selling to the pupils at five cents.

EDUCATIONAL NEWS AND ANNOUNCEMENTS

A Communication That Was Sent to President-Elect Roosevelt *

We come before you as educators deeply disturbed over the situation that confronts us. The children of this land and the ideals of our country—objects of concern for which we have a special responsibility—stand in serious jeopardy. We cannot in conscience remain silent. But critical as the immediate situation is, the causes of our trouble lie much deeper than the present crisis; rather are they to be found in the basic trends of our economic development. The time, we believe, has now come for all to recognize the crucial need and to coöperate in behalf of our common welfare.

I. *The Threat to Our Children.*

The present situation imperils much that we, as a people, hold most dear.

Our children and youth, as never before, face irreparable injury. In the wealthiest city of the land, nearly one-fourth of the school children are, according to official figures, suffering from malnutrition. Sixty-two thousand are fed daily by a teachers' relief fund, and the numbers are increasing a thousand a week. Throughout our land innumerable homes are, by unemployment or the fear of unemployment, severely strained. The moral and mental effects are no less serious. Losses of life-time savings from bank failures and investments add uncertainty and discouragement. The widespread confusion and conflict of thought and moral outlook increase the disrupting strain. Amid such surroundings our young people are growing to maturity seriously shaken in morale. Many, as they look forward upon life, feel genuine fear of a social order so capricious and so remorseless in its action. City slums increasingly breed youthful criminals. For the first time in our history hordes of youth, thousands upon thousands, wander over the country, living as best they can, cut off from the stable supports of society. At the same time, graduates of schools and colleges in immense numbers search vainly for employment. Though highly trained they wait vacantly in dangerous idleness, feeling that society has no place for them and seemingly does not want them. Such in grim outline are the difficulties and dangers which beset the growing generation.

But there is more. The child cannot be considered apart either from parents or society. As educators, then, strictly so considered, we are led inevitably by regard for the child to regard for his surroundings. We must be concerned for the homes of our pupils as we face the widespread paralysis of industry and agriculture. With 12,000,000 people out of work, one-fourth of the total population is directly affected; and 20,000,000 persons, we are told, are in actual physical want, dependent on charity or community relief. Our farmers, the largest single economic group, are in a most serious condition. With years of poverty prices, with unjust tax burdens, with mortgage foreclosures ever mounting—a peasant class is threatened. Under such conditions, for the educator to remain silent is not a proper neutrality but assent to a wrong. Conscience and intelligence alike drive us to a new vision of duty. The profession of education must accept its share of responsibility in collective effort with the American people to remedy these conditions.

II. *The Threat to Our American Ideals.*

The threat of existing conditions extends beyond the child to our most cherished historic ideals. As a people, we have desired every child to have full opportunity to achieve the highest and best that in him lies. The conviction has been reluctantly forced upon us that American life now makes impossible for a great majority of the children the realization of this hope. The present conflict of ideals, and the confusion and uncertainty of moral and social outlook work too strongly against it. A child growing up under existing conditions is denied a fair chance of the needed moral and spiritual development. Conscious education, even by its utmost endeavor, cannot withstand the mis-educative effects of our ill-adjusted institutions. Nor is this all. Our free public education is all but openly attacked. Reckless budget-cutting is rampant. Many schools face increasing enrollments with decreased staffs. High school tuition fees are proposed, while the elementary school is asked to return to the three R's and to give up important new functions such as health service, which has demonstrably contributed to the decrease of the death rate. These proposals are discriminations against the poor. As teachers and school officials, we willingly accept our fair share of reduced income, but we cannot consent to economies made at the expense of the children. That would be an irreparable damage, not to be considered even as a last resort.

Yet other American ideals are endangered. In normal times there are marked inequalities of wealth and income. Even in 1927, at the height of "prosperity," the standard of living for over half the population was below recognized standards of comfort. In even the best times, many are denied the chance to work, while a much larger proportion never attain reasonable economic security. Such conditions, even apart from their present aggravation, clearly preclude equality of opportunity which has been the cornerstone of American idealism. We have always cherished the democratic ideal, but it becomes increasingly clear that our institutions do not work impartially for the benefit of all.

The American people demand that

* This material was received from Mr. Clyde R. Miller of Teachers College, Columbia University, and was released to newspapers February 20. It bore the signatures of about 200 educators from schools and colleges located in different parts of the country. The signers represented only themselves.

Scanned with CamScanner

these, the historic ideals of our democracy, be taught in the schools. And we have accepted the task. But the conditions increasingly deny success to our effort. Can we then conscientiously teach these ideals unless we work also for such conditions as make possible their attainment? Any other course is insincerity, a moral outrage upon those committed to our care.

III. *Must These Disintegrating Tendencies Continue?*

As we ask whether the present situation must continue, three answers present themselves:

First is the answer that says: We suffer simply a temporary depression; if we but wait, the "good old days" will return. This is a survival from the earlier faith in "manifest destiny." Social progress is assumed to be inevitable. The correlative policy is one of drift—laissez faire: Don't interfere in the natural working of events; something will eventually happen to pull us out—possibly a new invention or perchance a war. At any rate there is nothing we can do.

A second answer is more sophisticated: Democracy arose among us as the accidental product of a virgin continent, rich resources, and virile settlers. These conditions have now passed and with them our democratic vision. America, then, like all mature nations, must be stabilized with an elite at the top and the mass at the bottom. Such an answer is Fascism in fact, whatever it be called. Some proponents of this position proclaim their "realism" and plan accordingly. They know that competition in the basic industries is dead, and they would bury it for their own benefit. Their plan is not to bring plenty to all, but to continue profits for the few. These few, then, with their descendants and the capable ones whom they hire, will rule. The rest must submit and accept lower standards of living.

The third answer looks deeper. It recognizes that our machine industry has radically changed the conditions of American life, but holds our democratic purposes to be as valid as ever. It would use the rich resources of our country and the marvelous possibilities of modern industry to secure plenty for all, now attainable as never before. It holds further that our present trouble arises not from the operation of inexorable natural laws, but rather from certain man-made institutions—once good but now out-moded. The correlative policy would rather then be that of intelligently devising appropriate institutions, revising where needed, contriving new ones if necessary—everything ultimately managed democratically and consciously done for the good of all.

As educators sensitive to our public trust, we cannot be neutral in this conflict of answers. Where childhood and essential values are at stake, morality exacts of us appropriate action. Anything less is to empty our profession of resolute character and intelligent service, and render us unfit to serve the young. It is just as true that we already have bases for

choice. Our just faith in intelligence and the sincere acceptance of our American ideals carry us already toward as decision. The facts in the case, intelligently considered, must do the rest.

IV. *The Underlying Conflict.*

The key factor in the situation is an essential conflict at the heart of our social-economic life. Modern industry has made life corporate: the economic welfare of all now depends upon the balanced functioning of our interdependent industrial society—the present acute distress in the midst of potential abundance is proof of the fact. Were our new resources properly organized there would be work for all and food for all. We still cling, however, to ideas and methods brought over from the past which now prevent the needed coöperative efforts. Serious consequences other than economic also result from this conflict. Men are torn morally: the new conditions demand that they act together; old ideas and persisting standards, adapted to a simpler social order, require that they act separately. Thus do our chief evils, both economic and moral, flow from this bottom conflict in our social life. Except as we deal with this underlying cause, we cannot hope to remedy the evils.

Can we, as educators and citizens, hesitate then in our decision? With our cherished values at stake, with reason pointing the way, our regard both for our country and for those committed peculiarly to our care compels us to the third choice: we must seek the good of all. We must then modify the self-regulating way of our pioneer period and devise instead coöperative measures fitted to deal with modern industrial conditions. At many specific points we have already made this change, but not yet consciously as a comprehensive program of action. The time has now come to make the fact of *interdependence* the foundation base of American thought and action. To develop the needed social arrangements will of course take time, but the direction is clear. Consciously devised arrangements must supplant mere drift and selfish opportunism. Our social and economic life must be directed primarily for the good of all.

V. *Functions That Must Be Cared For.*

We submit that certain essential functions of the needed coördination are not provided either by industry or by government as now organized:

1. The continuous gathering and interpretation of data for the intelligent organization and direction of basic industrial processes, as one integrated whole.
2. The determination in some effectual shared fashion of the social objectives which we set up from time to time for guiding the common aspects of American life.
3. The coördination of various parts of the entire economic mechanism: production and consumption, agriculture and industry, industry and industry, region and region.

Scanned with CamScanner

4. An intelligent apportioning of national income between investment for further productive equipment and purchasing power for consumers' goods.
5. The equitable distribution of occupational opportunities and appropriate insurance to care for unavoidable maladjustments.
6. Effective provision for those services which are essential to all, such as health, education, and recreation.
7. Provision for the intelligent coördination of our national economy with that of other nations.

The urgency of the situation, the magnitude of the task, and the necessity for continuous and inclusive study and consistent action point unmistakably to the need of a national council fully representative of our total social life. The economic aspects of the problem are so essential that agriculture, labor, and industrial management must all be included. But it is also of the utmost importance that other social interests—medicine, engineering, education, law, and welfare—be represented in order that everything that is done may be directed with an intelligent understanding of the larger social issues involved.

Certain existing laws and agencies will doubtless have to be modified in order to permit the degree of coördination control necessary to make the new arrangements effective. We believe, however, that determined leadership dominated by democratic ideals will quickly call forth a response in support of this positive program from the great mass of the people, many of whom have lost faith in temporizing measures and are now ready for definite action. Such a fundamental approach to existing problems will do much to restore our national morale. It is unthinkable that we should continue to drift into social disintegration when the intelligent organization of actual and potential resources could introduce a new era of unprecedented social progress.

Considering the inevitable effect of a maladjusted society upon our youth, the serious threat to our historic ideals, and in view of the urgent press of the matter, we the undersigned respectfully petition you as the incoming President to take such steps in coöperation with the Congress as shall at the earliest feasible time result in the organization of a National Coördinating Council empowered to devise policies and to recommend appropriate institutional machinery to care for these vital public needs.

A Million and a Half Books! All Sold and More to Come

The common idea that the book-buying public is comparatively small has been quite disproven by the recent announcement of the National Home Library Foundation of Washington, D. C., that it had disposed of one million and a half of its Jacket Library books, twelve of which have been issued, and is now preparing to offer a dozen more titles, this time stimulating an interest in good drama by including the works of playwrights.

The books are of standard size, and as the Foundation is a non-profit making institution, are distributed at 15 cents apiece. Fabrikoid, in attractive colors and designs, durable and moistureproof, is used for the bindings.

Among distinguished members who have recently been added to its Advisory Board are George Pierce Baker, the teacher; Eugene O'Neill, playwright; Eva Le Gallienne, actress, and Ludwig Lewisohn, critic.

Others on the Advisory Board are such leaders of contemporary thought as James Truslow Adams, Mary Austin, Dorothy Canfield, John Lewey, Abbé Dimnet, Havelock Ellis, Robert Hunt Lyman, George Russell (AE), William Allen White, John Haynes Holmes, Henry Pratt Fairchild, Will Durant, Arthur Capper, Everett Dean Martin, Levering Tyson and Kathryn McHale.

The first 12 books were: Treasure Island, The New Testament, Green Mansions, Alice in Wonderland, Pere Goriot, Emerson's Essays, The Merchant of Venice, Adventures of Tom Sawyer, Tales of Sherlock Holmes, The Way of All Flesh, Under the Greenwood Tree, and Palgrave's Golden Treasury. A second edition has been issued with a foreword by Mrs. Franklin D. Roosevelt.

Activities of the Division of Intellectual Coöperation of the Pan-American Union During the Year 1931-1932

As year by year the Pan-American Union becomes better known as a center for information concerning the twenty-one American republics, the most varied requests are received from governments, schools, commercial and industrial concerns, scientific and cultural societies, and individuals. The following requests are typical of the scope of the inquiries received in this Division during the past year: a comprehensive report on curricula and teaching methods used in the United States, in all branches of instruction; technical education in the United States; schools of soap-making and of ceramics; opportunities for art study in Mexico; commercial education in the United States and Latin America; medical schools in various Latin-American countries; education of the Indian in countries having a large aboriginal population; texts used in the various Latin American Countries for the study of history and civics; home life in Latin America; important Latin American criminologists; child welfare work in the United States; the practice of professions in Latin American countries; institutes in the United States for the study of social problems in industry; a list of inter-American treaties dealing with the interchange of professors and the practice of liberal professions; journalism in Latin America; Catholic poets of Latin America; publications on the art of printing and schools of printing. The services of the Division were requested by two Latin American governments in securing an expert in primary education and a psychologist, respectively. It coöperated with a committee of the American Association of Teachers of Spanish in planning a series of radio programs on Spain and Latin America to be broad-

Scanned with CamScanner

cast as soon as circumstances permit. It received and attended to as fully as possible requests for special publications from two libraries in Latin America and from several in the United States. It served, in coöperation with the Library, as an intermediary for the distribution of various special reports, which were sent to lists of names carefully selected for each case, and for the exchange of publications between associations in various countries.

A great number of inquiries were received from students and special investigators in the various countries, members of the Pan American Union, as to the facilities to be obtained in one or another nation, and the Division supplied the detailed information needed in each case. Special assistance was given to several persons going to Latin American countries for the purpose of carrying on some investigation, and a number of well prepared Latin American students were aided in applying for the scholarships of varying amounts offered by many universities in the United States. In this connection it is a pleasure to state that St. Petersburg Junior College, St. Petersburg, Florida, last year offered a tuition scholarship for each Latin American country. This brings the total number of institutions in the United States offering free tuition to forty-two, while about 35 more provide scholarship covering all or part of the living expenses; in addition, there are some given by certain educational and cultural organizations.

Among the visitors received during the year under review were university professors, teachers in elementary and high schools, students, scientists, writers, and representatives of various cultural organizations. Special plans were made for receiving certain large groups of educators holding meetings in Washington and two foreign student groups.

Aside from rendering various services in response to direct requests, the Division undertook certain activities intended to acquaint the peoples of the Americas with each other's cultural attainments. Lectures by two scholars were arranged for and correspondence was carried on concerning other lectures, while members of the staff of the Division spoke at two universities and two conferences. The Division arranged for showing in Washington a small collection of paintings by pupils in the open-air schools of Mexico and a set of lithographs by a Mexican artist, the latter having been shown also in New York and many other cities. Certain significant occasions were utilized for the dissemination of specially prepared informative material. The first of these was the bicentenary of the birth of George Washington, in connection with which data regarding Washington was translated into Spanish and Portuguese and distributed to schools in the Latin American countries through the ministries of education. A portrait of Washington, accompanied by a friendly letter from a public school in the capital of the United States, was also sent to a public school in each of the Latin American republics, eliciting a warm response from the school receiving the gift. The centenary of the birth of Juan Montalvo likewise received recognition. A lecture on the great writer by the Minister of Ecuador was arranged. The centennial was also brought to the attention of professors of Latin American literature throughout the United States.

The second Pan-American Day was more widely observed than the first, and several thousand schools used material provided by the Division. Those in the United States were supplied with suggestions for pageants, projects, study outlines, bibliographies and sources of printed matter, and a few sets of posters and other display material were loaned to schools having special Pan American Day exhibits. For distribution among Latin American schools, an attempt was made to secure illustrated publications from the governments and tourist agencies of the twenty-one republics. As a result several thousand pamphlets originating in four different countries were received and sent to the ministries of education for the use of schools. The Government of Mexico generously sent the seven paintings by art pupils, referred to above, which were later transmitted to schools bearing the name of Mexico in Bolivia, Peru, the Dominican Republic, Brazil, Costa Rica, and Uruguay, and to a school in Washington, D. C.

The publication of the Education Series in Spanish and Portuguese was continued as in previous years. These articles included various phases of educational progress in the United States, Colombia, Ecuador, and Uruguay. Data relative to intellectual coöperation in the Americas was prepared for two official reports to be submitted to the Seventh International Conference of American States. Both in response to the increasing demand from clubs and individual students in the United States for material on Latin America, and as a means of further stimulating that interest, the Division prepared very extensive annotated bibliographies on art, literature and education in Latin America, and shorter ones on Latin American home life and recreation, government, means of communication, great men, cultural life, the student movement, the social and educational condition of the Indian, Pan-Americanism, and similar topics of interest to students. Additions were made to the material available for lending, including several attractive posters and illustrated publications.

While the teaching of Spanish is very general in colleges and universities of the United States, the Portuguese language receives far less attention. During the past year the Division brought this matter to the attention of some of the larger universities, at the same time sending publications of interest to students of Portuguese and of Brazilian affairs. It was also enabled, through the generosity of a Portuguese gentleman, to arrange for lectures by a Portuguese scholar at four universities, continuing those inaugurated the previous year.

Scanned with CamScanner

The Division has coöperated very closely with many organizations and individuals that are working along the lines mentioned above. It is a source of gratification that the joint efforts put forth are bearing fruit, as shown not only by the increasing number of inquiries received in the Pan American Union, but by the greater interest and activity displayed by other organizations and the formation of new ones devoted to some phase of inter-American cultural relations.

—Release of the Pan American Union.

Per Capita Cost of Public Education Drops 22 Per Cent

How schools are coöperating in reducing costs of public education is disclosed in reports reaching the Office of Education, U. S. Department of the Interior.

Estimates based on data supplied for a special 1932-33 study indicate that the cost of education per child per day in school has been cut 14 cents since 1929-30. This means a decrease in per capita cost of 22 per cent in three years.

In 1930 the average cost per child per day of educating a child in the public elementary and high schools was 62.8 cents. In 1933 it is estimated the figure will be 48.7 cents. Federal Office of Education statisticians have reason to believe that when final data are in, the resultant average may be even less than 48.7 cents.

Of the 62.8 cents spent daily in 1930 on each child, 12.6 cents went into new buildings and equipment and other improvements. Only 50.2 cents went into current expense, that is, teachers' salaries, books, coal, repairs, etc.

Of the 48.7 cents being spent each day this year, 4 cents go into buildings and improvements; 44.7 cents into salaries, supplies and other current expense.

Comparison of data for other years shows that the decrease in 1933 is carrying per capita costs for public education to a level lower than any year since 1922. The average daily cost of educating a child in 1922 was 51.1; in 1920 it was 38.9 cents per child.

The comparative figures do not disclose the full extent of public education's reduction in costs. The figures do not take into consideration the increased proportion of high school pupils in the public school population. Since high school pupils cost about twice as much to educate as elementary school children, any change in the proportion has a profound effect on the expense of the school's undertaking.

In 1920, when the average per capita cost of public education was 38.9 cents, only 10 per cent of the school enrollments were high school pupils. In 1930 this proportion had risen to 17 per cent, and it is undoubtedly higher now—perhaps twice as high as it was in 1920.

This means that while the per capita cost for 1933 (48.7 cents) is 10 cents more than for 1920 (38.9) part of this increase is due to the greater percentage of high school pupils in the schools.

Cost in Cents Per Day in School Per Pupil in Average Daily Attendance
(For Public Elementary and Secondary Education)

Item	1920	1930	Estimate 1933
Current expense...	33.0	50.2	44.7
Capital outlay.....	5.9	12.6	4.0
Total	38.9	62.8	48.7

Study on Project in Science Education Made by The American Institute

Book on Children's Science Fair Announced

A detailed account of the Children's Science Fair has recently been published by The American Institute. The Fair, held each year by The American Institute at the American Museum of Natural History, for school children of New York City, has become a leading project in progressive science education.

"Each year," says Mr. L. W. Hutchins, Director of the Institute, "educators from all the surrounding colleges come to the Museum to study this undertaking. Representatives from different Museums over the country, such as the new Museum of Science and Industry in Chicago, the Buffalo Museum of Science and many others have spent several days with us going over each detail of procedure with a view to establishing similar Fairs in their cities.

"Requests from every major country in the world have come to us for information," Mr. Hutchins states. "This tremendous interest in science education has led us to present our project in a detailed treatise.

"The book, 'The Children's Science Fair — a Project in Science Education,' by Dr. Morris Meister, head of the Science Department of New York Teacher Training College and Chairman of the Plan Committee for the Fair, is written especially for science teachers and those museums and institutions which are interested in advancing the educational methods of their communities.

"Our publication," says Mr. Hutchins, "gives every step in the business of planning and actually handling a Science Fair, even to details of coöperating groups to be approached, reproductions of booklets of directions to go to the children, from letters which must go to all concerned, prize cards, identification cards and all the multiple arrangements which must be made. We feel that there is enough material here to make it possible for any other organization to prepare a similar Fair with only this book as a guide.

"In addition to the actual details, the book makes clear the underlying principles which must be kept in mind every step of the way.

"This year, in New York City, we had 478 exhibits representing the work of some 7,000 or more school children. The projects were displays of innumerable scientific principles and scientific observations. They were entirely the work of the child

Scanned with CamScanner

exhibitors. The recognition of this amazing interest of children in science leads us to believe that the Science Fairs are a leading factor in the advancement of educational methods."

The Seminar in Mexico

The Committee on Cultural Relations With Latin America (of which John Dewey is Honorary Chairman, Stuart Chase is Chairman and Walter Frank is Treasurer) announces the eighth annual session of the Seminar in Mexico for the summer of 1933. The first half, from July 8 to July 17, will be held in Cuernavaca; the second half, July 17 to July 28, will take place in Mexico City. In both parts of the session lectures, round tables and discussions will be included. Field trips will be made to points of interest. From July 28 to August 18 a supplemental program of trips is offered.

Membership in the Seminar is open to those interested in international relations and whose educational and professional qualifications enable them to make the best use of the privileges offered. The program is not meant to appeal to those who prefer merely a tourist's approach to Mexico.

For full program of the activities of the Seminar and costs of the trip under various plans, address the Committee at 112 East 19th Street, New York City.

REVIEWS

A Charter for the Social Studies

By Charles A. Beard. Charles Scribner's Sons.

The dynamic state of our institutions and even our ideas makes it especially necessary for teachers of the social sciences to be ever on the alert in order that their work may adequately serve the highest purpose of a changing society. Neither would we be true to our creed if we did not realize that future progress must necessarily be built on an understanding of the progressive steps already undertaken or proposed.

It was these two generalizations which led the American Historical Association to appoint a commission to begin the work of writing a summary of the best thought to date on the place of the social sciences in our educational system. A sub-committee, consisting of such eminent educators and leaders in this field as Beard, Counts, Ford, Krey, Merriam, Bobbitt, Bode, and Rugg, began the work with a consideration of objectives. For nearly two years these scholars examined the views on various phases of their problem of men from many walks of life, historians, educators in charge of administrative policies, classrooms teachers, as well as men in public or business life. These views were then submitted to the cleansing and healthful fires of research and discussion, and, as a result, there has emerged this tentative "charter for the social sciences," which, to quote Professor Krey, "attempts to weave into a coherent whole all the essential contributions." To Professor Beard was given the task of putting this charter into writing.

It is more than coincidence that during the last two years teachers of the social sciences in the New York City high schools have been searching their hearts more than ever before. They, too, have been examining objectives and putting them to the test of research and discussion. While it is doubtless true that vital differences still exist, that complete accord on many thories and practices can be found neither among teachers in our high schools nor among the esoteric, responsible for this charter, it is nevertheless significant that certain essential principles of civic instruction have emerged as a result of the work of both groups—principles which have been largely accepted by those, both inside and outside our city system, who have glimpsed the futility of the factual, recitation and provincial type of civic instruction in the preparation of our children for living in a world that has become "urbanized, mechanized, and interlocked in its social, economic, political, and cultural interests." How do the basic objectives developed in this "charter" compare with those upon which we, in the city schools, have been building in the last few years? If we assume that the objectives set up by these eminent scholars are valid, we are furnished with a yardstick by which we can determine whether we have been building on the proper foundations. Are we on the right road, or must we revise our notions of the goals of the social studies and strike out in a new direction? The publication of this preliminary study on objectives inevitably raises this question.

In approaching his problem, Professor Beard begins by establishing a certain point of departure—certain "declaration of fact" or "material assumption" which must be taken into reckoning in framing a program of social studies. To quote: "Speaking generally . . . we may say at the outset that instruction in social studies in the schools is conditioned by the spirit and letters of scholarship, by the realities and ideas of the society in which it is carried on, and by the nature and limitations of the teaching and learning process at the various grade levels across which it is distributed. They seem to set a certain inevitable framework for determining the content and applications of civic instruction."

In discussing the "necessities of scholarship," the author stresses the ideal of "truth" as the goal toward which scholarship must always strive, and this, even though truth is a relative matter, is not easy to discover, and often seems to fail rather than prevail. The historian of this century has also made it clear that truth must be sought "under the wide dome of universality." From these premises, the author reaches the conclusion that nothing that mankind has done on the face of the earth is foreign to the social sciences; that the spirit and method must be scientific. The scholar and teacher must, however, be aware of the limitations of this

Scanned with CamScanner

method. They must guard against case-hardened dogmas. Thus, paradoxically, the scientific method, "which applies the Socratic elenchus to accepted maxims, shrinks from attempting to devise a new maxim for every vacuum created by research."

Another "necessity of scholarship" is that we penetrate as far as possible into the nature of social science itself. What is it? According to the writer, social science is manufactured out of a vast complex of ideas, observations and experiences, supplemented by personal inquiries and experience. The individuals or groups who frame programs and methods are not infallible, but are themselves part of the drift they seek to describe. Also, under the stress of modern specialization, they cause social science to break up into the various separate disciplines.

But programs or methods can only be potent "when they fit, with some mysterious exactness, into the actuality of things in the process of development"; when they slowly alter great intellectual patterns by steady accumulation; when they affect fateful decisions in time of a crisis; when a little push here and there may appear to give a new course to human affairs. To be effective, therefore, a program of social studies must consider the realities of the prosaic world. What are some of these realities? They can be summed up in a series of words or phrases, familiar to all students of the social studies—the changing nature of society; industrialism; a technological, dynamic, rational and scientific civilization; the system of government under which pupils live in the United States in its "functional" aspects. It is also significant that, while the author decries evasion or omission of controversial questions as a basis for a scheme of civic instruction, he nevertheless warns us to be on our guard against the hasty opinion that the public schools can solve the problems of democracy, or even prepare the way for easy solutions by a presentation and discussion of current issues. It is, therefore, best to say that one of the chief functions of the social studies is to furnish the pupil with a "discipline in thinking." In passing, it is worthy to note that teachers and supervisors, now engaged in the work of drawing up new syllabi in American History, will find much food for thought in Professor Beard's list of specific realities or ideas in American life today—realities or ideas, which must of necessity influence determination of objectives in this phase of our work. These realities the writer presents in tabular form.

Professor Beard avoids a detailed discussion of the more unfamiliar ground, dealing with his third conditioning factor, "the nature and limitations of the teaching and learning process." There is nothing startling in his declaration that even the best-laid plans of civic instruction may be turned to dust in the hands of the untrained and timid teacher. Nor are we particularly aided in our everyday work by the elementary generalizations that we must grade our work according to the age and intelligence of our pupils; that we must proceed by realistic stages from the concrete to the abstract. We can only hope that later studies will amplify or make more definite these oft-repeated suggestions.

But what is of far greater significance to the teacher of the social sciences is the general conclusion regarding "the supreme purpose in civic instruction." This purpose is the creation of a *rich and many-sided personality.* The implications which follow from this are many. Thus, instruction must be *individualized;* it must develop *powers;* it must furnish *practical* knowledges; it must build *ideals, character;* it must develop *skills,* the instruments of power; it must create *useful habits;* it must develop *necessary and proper attitudes;* it must foster *will-power* and *courage;* it must build *constructive imagination and esthetic appreciation;* it must discover and train for *leadership.* These constitute the elements of the rich and many-sided personality.

To teachers in the New York City high schools these conclusions have a familiar ring. Examine the objectives listed in the "new" European History syllabus. Review the list of objectives set down by a committee of department heads for the teaching of the "gifted" child. Recall the many discussions about the reorganization of syllabus and method in order to develop in our children qualities, attitudes and skills. Remember also the recent study directed to the end that there be developed in our children an "inquisitive mind." These, and many other studies, experiments or discussions bear ample witness to the fact that the conclusions contained in this little volume have been substantially accepted by the rank and file of our teachers, who are now attempting to follow them with uncertain and faultering steps in their daily classroom work.

Whether or not we believe in the efficacy of the objectives underlying these programs or experiments, whether or not we feel that these objectives are attainable, we all know that they are there, and that we are attempting to progress along those channels in our efforts to make the social sciences function more vitally in the lives of our children and in our community. It is because this work of Professor Beard and his associates supports us in our groping for the light that we retain, as a result of its perusal, if nothing more, the comforting thought that, with whatever authority or prestige these men may speak, they support the present progressive trends in social science teaching in our high schools. A reading of this little volume will therefore be helpful in convincing some who are more skeptical that, in spite of possible mistakes in matters of detail, we have adopted aims or objectives to govern our work which, in broad outline, are valid, necessary and eminently worth-while.

The teacher who expects to find in this book definite or concrete suggestions on how these objectives may be attained *in the classroom* will be greatly disappointed. Perhaps it is unfair to level this criticism at a work

Scanned with CamScanner

which is meant to be nothing more than an introductory study. As such, it serves the purpose admirably. May we not hope that further studies of this commission, when published, will help more definitely to solve many of the problems which classroom teachers must face in attempting to organize social science syllabi and teaching procedure for the attainment of these objectives.

Bibliographies for Teachers of the Social Sciences

By Edgar Bruce Wesley. McKinley Publishing Company, Philadelphia, 1932.

It is patently impossible to become more than merely familiar with all the works in even one branch of the social sciences. To teach any one of the social sciences effectively it is of paramount importance to have a rich background. This background is the result only of wide, critical, organized and purposeful reading. Professor Wesley offers a reading program for the teachers in the various branches of the social sciences. Since the number of books listed is necessarily limited, the choice among a host of valuable works is of vital importance. Therein lies the value of the author's work.

The social science bibliographies are divided into eight parts, half of which are devoted to the different periods of history (Ancient, Medieval, Modern European, American) and the other half of government, economics, sociology and geography. These eight parts are in turn subdivided into three sections. The first section contains a brief discussion of the bibliography of the entire field and also suggestions to teachers desirous of making their courses of instruction well rounded, interesting, and vital. The second section merely names the outstanding authorities in the field. The third section consists of the bibliography proper. It is of particular significance that the bibliography does not consist merely of the names of books, authors and publishers, but also of a valuable criticism of all the works listed.

A list of stupendous proportions would probably discourage even the most earnest of teachers. The author wisely limits the number of works in each field to make of it a practical program. Furthermore, the books chosen are not necessarily those reputed for their scholarly character, but those of greatest use to the teacher of the social sciences.

Books concerned with educational matters may be sent for review to Miss Helen L. Cohen, Washington Irving High School. School text-books will not be reviewed.

The columns of HIGH POINTS are open to all teachers and supervising and administrative officers of the high schools. Manuscripts not found available for publication are not returned to contributors unless return is requested. All contributions should be typewritten, double spaced, on paper 8½" by 11" in size. They may be given to the school representative or sent directly to the editor.

Scanned with CamScanner

TEACHERS who have contributed some three millions of dollars to a fund for the furnishing of food supplies to children whose parents are out of work and have had added to this splendid contribution a cut in their salaries and still remain loyally at work, firmly convinced that no child should be made unnecessarily to suffer from conditions, are deserving of a large place in history. I am quite sure that this reward will be given to the teachers of New York City. But I cannot say when it will be given. I suspect, however, that the time for relief will be extended beyond what has been normal and beyond what we have been led to expect.

However that may be, I desire to say some things about the course of study that teachers and other members of the staff of the schools of New York may be thinking about them. I am quite sure there will be no letting up to this depression until we have shortened the working week to not more than thirty hours. This will involve new agreements between capital and labor. These will have to be worked out, which will take some time. Such agreements should be followed by understandings, at least with Germany and England, that similar understandings should be arrived at in those countries. When this has been done it means an amount of leisure time on the hands of the ordinary rank and file of the population which prior to this time has had no counterpart. For there is a vast difference between a forty-four hour week which we had until quite recently and a thirty hour week. How are we to prepare our children to spend this extra time which they are going to have at least in 1940 and 1950? I believe that we must reorganize our courses of study, and that we must give attention to music, the fine arts, and modern literature, preparatory to the proper spending of this time.

STUDENT REACTIONS TO ECONOMICS

I.

PROGRESSIVE secondary school teachers have frequently found student reactions to various teaching procedures adequate judgment as to the value of these procedures. This writer utilized a thirty minute pre-Christmas period to call for written observations on various phases about the subject of Economics.

This was the procedure. A half-sheet of regulation yellow foolscap paper was distributed to each of 101 pupils present in three Economics classes. They were advised that there was no necessity for signing their names to their papers, unless they believed that the presence of a name might make the opinion more valuable. Nobody was required to hand in his paper. However, handing in a paper would be appreciated by the teacher in helping him understand the students' viewpoints. It is interesting here to note that 70 papers were turned in, and 15 of these contained the names of the students; these latter ranging considerably in ability and capacity, as judged by past Economics marks.

The students were asked to divide their papers in such a manner as to provide room for answering these four problems in sequence.

1. Evaluate the present course in Economics.
2. What suggestions have you for improving the course?
3. Evaluate the teaching methods and procedures.
4. What suggestions have you for improving the teaching?

The objection may be offered that high school seniors are unable to answer, without advance thought, questions 1 and 2, and totally unfitted for answering the other problems. This objection will be conceded as correct, if we expect discussions couched in pedagogical terminology. However, if we expect natural, youthful, student-like reactions, no student who has spent three and one-half months in a course with a particular instructor is unable or unfitted for expressing distinct likes and dislikes.

II.

Apparently the students did experience a certain amount of difficulty in answering. Only two-thirds chose to hand in papers. Nor did all papers contain answers to all four problems. Six students failed to answer the first problem; nine omitted problem No. 2, while two others stated they could make no suggestions. As might be anticipated, 20 of the papers contained no allusion to the third problem, while 38 in all were unable to reply to the fourth problem, although six students here naively said they felt no suggestions were either necessary or possible.

The answers to each of the problems are very illuminating on student reactions to a number of matters that

Scanned with CamScanner

have long vexed teachers and supervisors of Economics. Unfortunately, objective scoring and tabulation of the answers are not possible because of the very nature of the questionnaire. Still, the students themselves repeatedly commented upon the length and content of the course, interest in and value of Economics, examinations, text-books and the sequence of topics in their discussions for questions 1 and 2. The frequency of comments upon particular aspects of Economics as part of the curriculum may reasonably be regarded as a representative sample of general student opinion on many moot questions.

In the evaluation of the course, we encounter a wide range of judgment. Two students frankly found Economics "very boring and uninteresting," five others called it "rather interesting," while thirteen enthusiastically labelled it "very interesting and valuable." Among this latter group we find such encomiums as these, in reference to the subject matter of Economics: "An education in itself"; "Absolutely essential"; "Like course better than any in a long time." The two commentators on the other end of the scale were less extreme in their expressions, and contented themselves merely by denying that Economics would be as valuable in later life as other subjects in the curriculum. Moderates in the group alleged repeatedly that Economics "helps one think for himself."

Some of the papers here offer significant expressions of evaluation. Three observers venture that they liked the course better than students of previous terms had caused them to anticipate. Surely much missionary work can be done in this respect. All teachers of Economics have regularly found that many students come to the first session of the class pre-advised of gloomy days. Many are frequently in dread of the future. For successful, happy teaching this attitude must be disarmed and dispelled. Until this is done, classroom activity is encumbered. How much more fortunate might we all be, if we could generate a tradition of happiness, of practicality, of vital importance about Economics to students as they pass through the terms before eligibility to the course! Students eager to learn, confident of the future, assured of the acquisition of practical knowledge make better students in Economics.

III.

All papers were most prolific in answering the second question, "What suggestions have you for improving the course?" However, the distribution of the answers prohibits any quantitative scoring of great significance. It can be said generally that a variety of suggestions appear of both destructive and constructive nature. Destructive criticism referred to such items as the bulging content of the course, the proportionate emphasis on various topics within the course, the sequence of the calendar of topics, the departmental requirement for projects, and the Regents' examination.

Teachers of Economics will be interested most in what students suggest regarding the content of the semester's work. Complaint was made against the inclusion in the course of such non-practical material as the opening definitions and laws of consumption. Ten students singled out "subjects like hedging" for their displeasure. Instead they pleaded for more emphasis upon such topics as stocks and bonds, banking and credit, business cycles and their causes, and wars. The entire trend of student opinion here is for more practical, more useful, and more intimate topics in Economics.

Only three students definitely stated a belief that one term of Economics was adequate. Twelve others urged a two-term course for all students for the sake of thoroughness in teaching and learning. One youngster would rank Economics with English, but will be content if Economics is given for at least two years. One other student, of great capability but lacking in diligence, amazingly urged that the subject be carried by all students in each term of high school. Will wonders never cease? However, by the silence of the majority of the group, it has been assumed that the one-semester course is generally suitable.

Miscellaneous suggestions for improving the present course included: (1) Eliminate over-reliance on the text-book; (2) Get a better text-book; (3) Abolish Regents' tests (four votes); (4) Avoid too much detail; (5) Eliminate projects other than book reports; (6) Secure greater student participation; (7) Begin the course with more practical things than economic laws.

More constructive criticism containing suggestions valued by this teacher touched upon the study of current events, the use of the newspaper, the technique of daily review.

Considerable approval was expressed for the maintenance of the present newspaper work in teaching Economics at Abraham Lincoln High School. The practice has long been to devote one day a week, the "unprepared" day, to the study of the daily newspaper for its economic aspects. Five students suggested replacing this procedure by spending one-quarter of each period on the public events of the preceding day. Unqualified approval was indicated for the very existence of a newspaper study habit.

One valuable suggestion pertained to the daily review. "Why not start each day's work by asking for questions on the previous day's work?", one pupil queries. This procedure will definitely be adopted. It will permit of many economies in reviewing previous work. It will serve as an effective weapon for impressing students with the continuity of the teacher's calendar for the term. Thus students will acquire a valuable study habit, that of beginning all new work with a review of the pertinent work immediately preceding it. Furthermore, the obvious nature of a relationship between two units of work will ease the transitions, and will frequently serve as adequate motivation.

IV.

How did the teacher fare at the pens of these commentators? In answering the third problem, references were made to the teacher's classroom

Scanned with CamScanner

attitude, to his use of the board, the examinations and marks, and to the use of illustrative material.

The students appreciated what they termed variously (in eleven papers) the informal, friendly, "unteacherish" attitude of the instructor. Six other students specifically referred to a happy combination of "work and humor." Here at least are six converts who will deny that Economics is a dismal science.

Particular points in the teaching process were chosen for representative comment. A daily topical outline on the board found favor with the students. One student clearly declared himself when he said, "All lessons should be like the one on credit instruments." Like similar lessons elsewhere, this lesson was taught with the aid of objective materials (a check, a promissory note, and a domestic draft), with the use of prepared forms on the board, and by the direct exchange of the instruments among pretended merchants in the classroom. Five other comments lauded the use of local illustrations familiar and dear to the majority of the student body.

Unfavorable criticism struck at the hard examinations and low marks given by the teacher. Too much repetition of some topics, excessive speed with other topics, and the teacher's adamant stand on disputable subjects were censured. Strangely enough, three persons complained that the teacher made the work childishly simple, as if the students could not be credited with adult intelligence.

It is interesting here to observe that two students admitted the homework given was not excessive. This is a considerable admission for students to make. Certainly the increasing trend of progressive education is in the direction of more "doing" in the classroom, with less reliance on homework. On the other hand, many educators still maintain that homework carefully planned and assigned yields many fine fruits, what with our short school days and many holidays.

V.

As already indicated, the last question, "What suggestions have you for improving the teaching?" presented the greatest difficulty to the students. Accordingly, only 50% of the papers contained answers to the question, and these answers are far less significant than those to the preceding questions.

A miscellany of suggestions occurs. Somehow, a number of these are on the side of tightening classroom administration. For example: (1) Give written homework more often; (2) Give marks for daily recitations; (3) Review and mark homework more frequently.

Two valuable suggestions touch upon the important topic of visual aids in education. One urged a greater "economic atmosphere" in the room. This was to be secured by the use of more charts and posters than the seven already displayed. The second student, in his suggestion, wondered whether stereoptican slides or motion pictures were not available for studying various topics in the term's work. And why didn't we make more trips to the

Custom House when studying the tariff, to the Federal Reserve Bank, and so on?

Certainly here is an accidental hint for the further extension of visual education work. Visual materials have already been adopted bodily in such subjects as Economic Geography. Much remains to be done in applying them to Economics. It is more than likely they will prove efficacious in particular topics.

WILLIAM FRIEDMAN,
Abraham Lincoln High School.

THE GENERAL ORGANIZATION BENDS THE TWIG

No thinking man can escape, at some time or other, a feeling of disgust at the conditions of politics—especially municipal politics—in this country. No thinking man can compare our present degradation with the glowing hopes of the eighteenth century democrats and not feel a sinking of the heart. The failure of democracy is becoming a widespread conviction. Some eminent minds see no hope for us except in some form of benevolent and intelligent tyranny like Fascism.

But this despair is as illogical as was the earlier Utopian optimism. Admitting the present shortcomings of democracy, we need not admit them as hopeless or beyond repair. Quite conceivably, they are not inherent in the system, but merely the temporary results of temporary conditions—conditions, perhaps, of our own careless making. In any case, we have not given democracy a fair trial. It must be admitted that democracy, to function well, requires a peculiarly alert, intelligent, and high-minded citizenship. Now, such citizenship does not make itself. There is nothing in man that makes him naturally and instinctively a good citizen, any more than there is anything in him that gives him an instinctive mastery of the multiplication table. If we want our people to know multiplication, we teach it to them. We don't throw up our hands in despair because they do not achieve a mastery of it without instruction. Similarly, if we want the sort of citizenship required for effective democracy, we must teach, train, educate. Any virtue, whether it be good citizenship, or truth telling, or tolerance, comes only as the prize of long and patient discipline. Only after we have employed such discipline in worthwhile and sensibly planned ways, for, let us say, half a century, only then shall we have a right to despair of democracy if conditions do not improve.

In this matter we do not act sensibly. We would not think much of an industrial engineer who, after inventing a marvelously intricate machine, set in control of it an untrained workman with no understanding of that machine. Yet, that is just what

Scanned with CamScanner

we do. Our boys and girls automatically assume the suffrage at twenty-one. What specific political training have they had? Our courses in civics and history, as everybody knows, are laughably unsuited to this end. In fact, we can go further. We can argue that our schools, so far from training for good citizenship, are directly contributory to bad. Certain conditions in our schools develop these very traits of character that work out into corruption and inefficiency in our political life. We complain of "bossism"? Of the low-minded selfishness of our leaders? Of the inertia, the callousness, and the credulity of our voters? We have no right to complain. These are the plants we breed in school. We teachers help to make the "boss," and we help to make the "heeler," just as certainly as if we followed a syllabus and a daily time schedule in their production.

I am not now referring to the fact that our whole system of instruction viciously prevents the pupil from learning the one lesson that every future citizen of a democracy should learn above all else—how to bear responsibility. To change this condition would require a revolutionary upheaval of our whole pedagogy. What I refer to now is one certain narrow procedure which is at present a tremendous power for evil, and which may easily be changed into an equally important power for good. I mean the present conduct of the General Organization, especially as it exists in the high school.

Consider how the General Organization is run. Consider first the nominations. Usually the word goes out that by a certain day candidates must be nominated either in a caucus of room delegates or by petition. In either case no one is much interested, except a few little cliques whose concern is not the school's welfare, but the quite selfish desire to hold office. Except for these few self-seekers, the great mass of students is grandly and colossally indifferent. Now this indifference and passivity are precisely the conditions which make possible the graft and incompetence of adult politics.

Look now at the campaigning. This is generally done by way of blotters, posters, bills, and perhaps a rally or two in the auditorium. The issues mentioned (if it is thought worth while to mention any) are felt to be purely imaginary, or at least trifling and unimportant. The G. O. is known to have so little power, its effect on the school and on the students is so little felt, that the issues raised must seem fictitious, unreal, manufactured for the occasion. Perhaps the parties and candidates may make all sorts of extravagant commitments which the G. O.'s utter powerlessness must make extravagant and impossible to fulfill. Again how like adult politics! Or the electioneering may consist of lauding the athletic and social powers of the candidates, with only the remotest reference to their fitness for government. Why, indeed, mention fitness to govern, when the G. O. doesn't govern?

When election day arrives, the pupil voters feel—how? Empty issues, impossible promises, meaningless parties, candidates nominated by little cliques and lauded for virtues irrelevant to a political representative—in this structure of sham and make-believe, how can anybody in his right mind be expected to take a serious interest? Where is there room here for reasonable choice, for the development of political judgment? How can the pupils vote other than for the silliest of reasons — because they like Leona's smile, or are won by Alexander's back-slapping affability, or admired Rupert's plunging at football! And this is the political conditioning, this is the heroic political discipline we give to those who, five years hence, will be deciding the destinies of our country!

The elections over, the G. O. and the successful candidates are heard of no more for the rest of the term. Doubtless, the officials hold periodic meetings which no one else hears of, pass routine resolutions about routine trifles which no one else cares or knows about, and, in effect, so far as the school is concerned, cease to exist till the same old merry-go-round begins again next term. Here we have an absolutely accurate replica of government in the American city; indifference and ignorance on the part of the voter; self-seeking and irresponsibility on the part of the politician; vulgarly low standards of public morality on the part of both. Now if an ingenious man deliberately set himself to create a school condition that would degrade the next generation into a readiness for political skullduggery, could he think of a better device than such management of the G. O.?

Rather than permit the General Organization to exert such an influence, we had better abolish it. We may not be able to remove those influences in life which make for bad politics; but surely we should not permit such influences in our schools. However, to abolish the G. O. would be a pity. If properly instituted and properly conducted, it is a very effective instrument in training for good citizenship—better than all the courses in civics ever planned by the most sanguine educator. That it is capable of being such an instrument—of arousing keen and lifelong interest in public questions, of training in habits of sound political judgment, of forming lofty standards of public morality—is attested by the experience of a small number of high schools in this country. The only thing needed is a principal possessing a little enthusiasm, some prudence, some power of leadership, and a willingness to wait and be patient. Now, what conditions make a healthy milieu for the G. O.?

First of all, the G. O. must be cleared of that atmosphere of sham, of unreality, of unimportance. If we expect our students to feel keenly about politics, they must first feel that politics matters tremendously. To expect them to feel keenly over a puppet organization with the shallowest pretences to any sort of power, or usefulness, or even existence, is preposterous. The first condition must be to give the G. O. real power, genuine control of the school. It must be al-

Scanned with CamScanner

lowed to take over every aspect of school life except the strictly pedagogical. It should take charge of discipline; police the corridors and study-halls; run the lunch room (subject to the financial check of the faculty auditor and the hygienic check of the faculty dietician); regulate the yards and the athletic field; organize athletic, social, and club schedules; manage absence and lateness (subject to legal provisions); try offenses and administer punishment; control traffic — legislate directly, in short, for the health, comfort, efficiency, and safety of the pupils. The G. O. need not be, as it generally is today, a silly shadow, a foolish sham, a laughable make-believe. A school of a thousand pupils is a real community, and presents problems that may be as pressing and as monumentally important to the pupils as foreign debts and the depression are to the White House. The handling of such problems, if entrusted to the pupils, will develop the habit of political responsibility, of keen concern, of active interest and participation. It should counter-act admirably the indifference and apathy that usually mark the American voter.

Our first step, then, is to create a genuine political situation by giving the G. O. control of the school. We must also combat the tendency for the voters to become political-minded only at elections or during infrequent crises. School politics must not be permitted to sink out of sight immediately after election. Instead, the school must remain in a continuous low fever of political activity the year round. The G. O. must hold its meetings in open forum. All students are invited to attend, to join the discussion, to present petitions, to initiate legislation. No law should be enacted without public hearings. The officials should feel free to ascertain public opinion by frequent referendums. No week, in short, should go by, or should be permitted to go by, without some reminder to the voter that he, and he only, is the ultimate source of authority and responsibility, and that the business of government goes on, not only at stated periods, but throughout the year.

Nor is this all. Not only must the pupils be continuously engaged in school government; they must be actively engaged. They must not learn to be satisfied with the passive rôle of the mere watcher. They must not learn to be satisfied with leaving the naming of the candidates, the framing of platforms, the deciding of policies, in the hands of a few. They must be compelled to do as much of this political thinking as possible. Our goal should be, not the purely representative form of democracy made necessary by enormous numbers, but a sort of modified New England town meeting, where the voter coöperates actively with his representatives in the work of government. The G. O. must be so constituted that all movements begin from below. Every home room must have local autonomy; it must be the pupil's permanent little fatherland to which he has a chance to develop a strong loyalty in the four years of his high school course. Every home room must have its own organization; so must every grade. Candidates to office in the G. O. as well as in the grade organizations must be presented, not by a little clique of "higher-ups", but by the voters themselves in the home rooms. Issues and platforms must be first presented and debated in the same local democracies. In every case, the source of every movement and the first unit of discussion is the home room, where the individual voter is most conscious of his individuality and his influence. Every precaution must be taken to prevent the complete delegation of power, responsibility and activity to the representatives. Now, a pupil graduating from four years of such schooling will, we may be sure, cause some restless nights to the leader of the local political club he will inevitably join.

The plan to ensure continuous training in clean, healthy politics through the G. O. is open to objection on several grounds. First, it may be considered imprudent to trust immature youngsters with such power over the school community. The reassuring answer to this doubt lies in the few schools where such a system obtains. The experience of these schools teaches us that nothing sobers into prudence and caution like real responsibility. We learn that such real pupil-government works safely with pupils of only average age and average mentality. Besides, let us remember that we can effectively prevent hasty and unconsidered legislation. To this end, as well as in the interests of real democracy, we can set such an interval between the first proposal of a measure and its final enactment into law as to compel ample time for discussion at open hearings. If a proposal is imprudent, the faculty has the right and the duty to make itself heard in emphatic warning. The faculty may even be vested with the veto in certain extreme cases. But experience has frequently proved that pupils who really govern themselves do not disregard the opinion of the faculty; they are, in fact, more conservative than the faculty. We assume, of course, that this reform in the General Organization will be made step by step. To make it an overnight revolution is to ensure disaster.

A much graver objection lies in the fact that no political or social machinery is any good in itself. It is only as good as the people using it. "Reformers" frequently forget this. They are so much concerned with repairing organizations that they overlook what is much more important—the spirit, the soul, the character of the people which will express itself through these organizations. No institutional changes for preventing "bossism" will avail so long as the attitude of the voters remains unchanged. One generation splits a great party in order to establish direct primaries—why? As a check on "bossism." The next generation abolishes direct primaries — why? As a check on "bossism." True, our regenerated G. O. will ensure political activity—but of what sort? Will this activity be honest, upright, intelligent; or will it be of the kind we know too well? In fact, can the pupil

Scanned with CamScanner

be expected to avoid bringing to school with him the ignoble ideas that lie all about him in the community, that are shared probably by his own family, that are in the air he breathes?

We cannot, therefore, and should not, rest content with merely reorganizing the G. O. We must accompany this reorganization with a systematic, school-wide and permanent campaign of education in practical civics. In fact, we must regard the G. O. simply as a practical extension of our classroom work in civics, or (to reverse the arrangement) we must regard our civics syllabus as a preparation for membership in the G. O.

Such a plan will, of course, require changes in our civics and history courses. It will involve a shift from theory to practice; from the abstract to the concrete; from government on paper to government as it actually works; from enumerations of forms, duties and departments to discussions of problems, short comings, causes and remedies; from a coldly intellectual memorizing of facts to heatedly emotional debates that form ideals, repudiations of what is, yearnings for what may be. The emphasis will be not intellectual, but emotional and moral. The object will be, not to know, but to feel so strongly as to be compelled to do. The mode of approach will be not the reading and reciting of generalizations, but the debating of the personal problems involving the relation between the individual and his government.

We must go further; we must dovetail intimately our class work with the running of the G. O. Every political function the pupils perform must be preceded by classroom training and discussion. Must G. O. candidates be names? A period, or several, should be devoted in English or civics to such questions: "What qualities should a suitable candidate possess? Whom do we know that meets these requirements?" Is the campaign under way? Some time in English or civics should be given to comparing candidates, reporting interviews with them, and so forth. Must a platform be formed, or some point of policy decided? What more suitable material for oral and written work in English and civics? And so on, through the complete round of the year.

Does this sound Utopian? It need not. Nothing in this proposal is forbiddingly difficult. The one thing needed is that the principal possess a little enthusiasm, a little foresight, and much patience. Such a General Organization in every junior and senior high school in the country would regenerate American politics in twenty years. The Jesuits were right: "Give us the child (was it for the first six years?) of his life and you may have him for the rest." We have the child —every child—for a large part of his waking hours over a period of eight to twelve years during the most plastic period of his life. To what can we not mould his mind—his character? But we must have a vision—a purpose —a plan. We must set up our clear goal, and strike out for it with boldness and intelligence, instead of drifting aimlessly down the muddy current of our political life.

H. C. Bricker.

THE ROLE OF EDUCATION IN RECONSTRUCTING SOCIETY

I.

The young men and women in our high schools look out on a confused world. Their candid eyes are not to be blinded by evasions. In the troubled faces of their parents they see only confusion. If their homes are ravaged by unemployment and want, they suffer inwardly with the acute sensitiveness of the young.

The economic blows which we have felt until now only to a limited degree, will deal cruelly with them when, in a few years' time, they emerge from the protecting environment of the school. Has their education equipped them with the knowledge and the will to deal intelligently with the economic issues which, to a greater and greater extent, will demand solution by the electorate of the United States?

Education has—once more—reached a turning point. The accepted aims and achievements of our high schools have evidently been inadequate to meet the needs of the present situation. While social and economic conditions change rapidly, education lags behind, content to preserve its traditions and its established ways. The accepted aims — individual development, social adjustment, inculcation of habits—have their important values, but fall short of the demands of modern economic society. It is the purpose of this paper to indicate the new direction that we must take.

II.

The salient economic problem of the contemporary world is the mastery of the machine. We are all familiar with the terms of this problem. The current fad of Technocracy has dramatized the truism that the major cause of the depression is the phenomenal growth of technology. Machines have displaced men, and this process will undoubtedly be intensified in the future. At least five million, possibly ten million, workers in the United States have been displaced from industry—permanently, unless society is able to gain control over the machine.

How can this control be effected? By rejecting the nineteenth-century belief in "laissez-faire," which involved individual enterprise and competitive business. This doctrine was undoubtedly of value in a century of expanding markets at home and abroad. Even then the uncontrolled economic system broke down periodically. But on the whole it worked well enough. It stimulated invention and enterprise; it opened up the resources of our country; it made possible the improved conditions of our life. In general, education subscribed to this doctrine by making its aim the development of efficient and industrious individuals.

Several schemes of economic planning have been worked out in recent years by leaders of American industry and thought. For periods of depres-

Scanned with CamScanner

sion, unemployment insurance, such as exists in England, has been suggested; the leading advocate of such a plan is Gerard Swope, of General Electric. President Roosevelt's economic counselor, Professor Tugwell of Columbia, favors, at a time like this, an elastic program of government construction of bridges and highways and the eradication of the slums. A more comprehensive form of economic control is that of long-range economic planning, suggested by George Soule, economist. This involves a central Federal board, established under a Constitutional Amendment, with more or less complete control over the major industries of the nation. Its functions will be similar to, but more complete than, those of the Interstate Commerce Commission. This economic board will be empowered to assign quotas of production to each industry, including agriculture, fix wage scales and working hours, limit profits, and control credit. By this means it is hoped the economic life of the nation will be stabilized. It is impossible to do more here than suggest the barest outline of these schemes, but a detailed treatment is available in an excellent booklet, "Long Range Planning" by George Soule, and in a comprehensive volume, "America Faces the Future," by Charles A. Beard.

However we may feel individually about the advisability of economic control, this much is certain: that tentative measures are already being taken by the government in this direction. The electorate of the country will be required to decide, in the near future, whether such measures are to be extended. The schools must provide the citizens of the country with a basis for intelligent interpretation of events and intelligent decisions. The problem invites our best intellectual efforts. It challenges us as individuals; it demands the most serious consideration from us as teachers.

III.

Pragmatically, the value of the idea of economic control can be tested by observing its results in practice. The one nation in the world in which economic control is absolute is Soviet Russia. We should therefore study, with scientific skepticism and yet with sympathetic understanding, the practical working of the Soviet system. Especially valuable to us will be a knowledge of the technique by which the government has integrated the school and society and has made use of educational methods to further its aims. The achievements of Soviet education will give us a renewed sense of the power that lies within our grasp to influence the destiny of our nation.

Observers in Russia, among them recently Will Durant, agree that living conditions for the mass of people are far from ideal. Some have concluded from this that the planned economic system in Russia is a failure. Certain considerations, however, would indicate that this judgment is unfounded. In the first place, when Russia emerged about ten years ago from years of devastating civil wars and foreign invasions, her economic life was paralyzed; the effects of this

dreadful period are still felt. Secondly, the Five Year Plan concentrated on developing the basic industries—fuel, metals, machinery, railroads—and neglected the production of consumable foods, clothing and household articles. Thirdly, in order to finance the Plan, Russia exported every available unit of her produce—wheat, lumber, and oil—and deprived her own people of all but the barest necessities.

There are, moreover, certain indices of future improvement for Russia. First, there has been a remarkable increase in industrial output, from a basic index-figure of 100 in 1922 to approximately 250 in 1932. Furthermore, the second Five Year Plan is devoted to the production of consumer's goods. As technological gains are made, the working day—it is now seven hours—will be decreased progressively, thus providing the population with leisure sufficient for a cultured life. Incidentally, such a reduction in the number of hours of labor in the United States is being suggested under the plans discussed above. Moreover, there is no unemployment in Russia: several American workers, with whom I traveled to Russia the past summer were immediately snatched up by the employment bureaus. With the ecenomic system under the complete control of the State, life will be secure.

To us as teachers, the important aspect of the Russian experiment is the social rôle of education. Education plays a vital part in the Soviet scheme—more so than with us. Education for them means more than schooling or technical training, though these are important. It uses every possible instrument for affecting people's attitudes—the cinema, the newspapers, the schools, the workers' clubs, museums, and so on. Education means the "engineering of human consent," the creation of intelligent acceptance and an active participation in the socialist state. John Dewey, on his visit to Russia, was particularly impressed with the way in which the masses were given a knowledge of the economic basis of their life and an impetus to coöperate in its manifold activities. I remember waiting half an hour in a laundry in Leningrad while the entire staff was engaged in listening to a lecture on the political situation in Germany. Such meetings take place frequently in all the places of work.

Important media of education are the arts and the theatre. The aesthetic theory under which the Soviet operates is that art is propaganda, or, more broadly, that all forms of art reflect economic and social conditions. Western Europe and the United States are loath to accept this formula. In the Hermitage Museum at Leningrad —one of the world's greatest art museums—I was interested to hear the guide interpret paintings in terms of contemporary social conditions. For example, pointing to Leonardo da Vinci's "Madonna and Child," she explained that this was an instance of ecclesiastical propaganda. A representation of succulent fish and viands, she said, had hung in a nobleman's dining room to stimulate his appetite. A painting by Tiepolo, "The Feast of

Scanned with CamScanner

Cleopatra," we were told, depicted the might and splendor of the feudal aristocracy, and the guide remarked that this luxury was founded on the exploitation and impoverishment of the lower classes. Literally hordes of people, workers, peasants, soldiers, children, visited the museum while we were there.

The theatre, especially the cinema, is used as an educational instrument. Anyone who has seen a Russian film in New York at one of the intimate theatres knows the theme of almost every Soviet picture, namely, the transition from the old ways to the new. For example, "The Road to Life" depicts the successful efforts of educators to rehabilitate the groups of wandering children who were made homeless by the civil wars. "China Express" depicts the revolt of Chinese coolies against their oppressors. It is interesting to contrast with this the American picture "Shanghai Express," which borrowed its setting and structure from the Soviet film, but which deals with the conventional romantic theme. The cinema is a powerful means of influencing mass opinion.

The schools have received a tremendous impetus under the Soviet regime. The entire nation is at school. Illiteracy has been reduced from 60% in 1913 to about 15% in 1932. Elementary education is free and universal, and to a large extent serves the same functions as our own, that is, in teaching the fundamental skills of literacy. But its chief aim is to bring into being the "new man" of the future, a supporter of socialist policies, an active, militant, healthy, socially conscious, politically minded individual. The curriculum at the ten to twelve years level emphasizes the social sciences, history, economics, and sociology. Classroom studies are supplemented by regular visits to factories and collective farms. The pupils at the fourteen to eighteen age level do not passively observe; they actually participate in the life of the community or village; they work as "shock brigades" to sow and harvest crops, to bring books to the peasantry, to carry to the "dark areas" enlightened ideas on sanitation, and so forth.

At the present time the school work centers about the problems of collectivization and the Five Year Plan. A typical project for a term in a rural school is a study of the Village. This project includes the following topics: a study of crops and agricultural methods, old and new; the relation between the farm and the city; social life and education in the village; plans for coöperating in the improvement of conditions. One of the text-books used at the 10-12 age, "The New Russia's Primer," by M. Ilin, has been translated and gives a vivid idea of the type of social studies with which Russian children are grappling. An excellent presentation of the actual operation of the Russian educational system is contained in a book published this year, "New Minds: New Men?" by Thomas Woody.

IV.

Can our schools, too, play a part in creating a social intelligence in our population? Yes, decidedly. Once we have convinced ourselves of the desirability of economic control, we can expand the curriculum in the social sciences to include a study of its principles. High school pupils are quite capable of understanding these ideas; in fact, are quite alive to the economic problems of the present day. Already, in the history course, they study the Industrial Revolution of the nineteenth century; the new curriculum would shift the emphasis from the past to the present and the future. In the Civics course, a greater stress would be placed on how the socially-minded citizen can use his power to effect progressive reform in government.

The Economics course would be enlarged to one year at least, and the central project, from which the specific content of the course would radiate, would be the plans for economic control. Furthermore, we must make our own pupils realize that the most vital problems of their generation will be economic and political in nature; they must not graduate without an awakened consciousness of these problems and an adequate basis of knowledge for their solution.

V.

In this critical period of our national life, we, the body of teachers, must assume our rightful position as the intellectual leaders of society. We must not drift in the currents of indecision in which our political leaders and business prophets have been floundering. We are aware of their failure to anticipate and prevent the disastrous events of the past two years. In our hands, more than in those of any other professional group, lies the duty of building a next generation of intelligent men and women, who will order the national life more wisely than their fathers. The opportunity is ours, the road is open to us if we choose to follow it. Will we accept the challenge?

ALFRED VOGEL.
Boys High School.

THE INAUGURATION OF A DEPARTMENT OF INDIVIDUAL CORRECTIVE ACTIVITIES IN THE TEXTILE HIGH SCHOOL

LONG before our new building was completed, the staff of the Department of Health Education had discussed in conference and informally all the problems and phases of the Individual Corrective work. We felt that there was a need for it. We felt that only through proper physical and personal professional preparation could this work be inaugurated under the proper auspices. With this in mind, we felt that every case was to receive individual, careful and detailed attention. And so we began the details of preparation for service which would be restricted, individual, corrective,

Scanned with CamScanner

medical, hygienic and social in its effect.

Mr. H. Herman, a teacher in this department, specially trained in this type of work, was appointed chairman of a committee to inaugurate the details. Through his efforts, a syllabus was prepared and several other teachers in the department were trained in the routine for this special activity. Many of the details of certain pupil cases and further case summaries are taken from groups reporting in the first, third, fourth and fifth periods. He has been of great assistance in the preparation for this special corrective service, and especially in the preparation of this report.

The details of our activities from February, 1932, to June, 1932, will be noted briefly, under certain definite headings. As a matter of fact, we discovered that our preliminary layout worked out very nicely in practice.

Equipment

We have a very nice room, well-equipped with standard apparatus for our Individual Corrective work. Many pieces of apparatus and equipment were improved by the boys to meet their individual needs. These added materials bid fair to make our service more individual in nature. In the Fall, we propose to add, through school funds, a complete photographic outfit to record the findings of each boy in pictorial form, so as to show to the boy his progress or lack of progress.

Examinations

At the very beginning of the term, during one of the regular class periods when the boys were in their places on the floor, the teacher of Individual Corrective work, with the assistance of the teacher on the floor, assigned boys to the Corrective Room in the following manner: The boys were asked to strip to the waist, and the teachers would hastily examine, one at a time, each boy in the line for such patent defects as could be determined by a hasty examination. Position of the shoulders, head and neck, displacement of the scapulae, alignment of the superior posterior spines of the pelvis, and curvatures of the spine which could be noticed without detailed methods, were the items examined. When the class was examined, those boys who thought they had flat feet were asked to present their names to the teacher. The boys examined in the class were noted and their defects marked. Other boys who were excused from Health Education because of medical requests, were placed on the Individual Corrective list, as were those who were excused because of lameness or other evident physical defects. These boys were asked to report to the Corrective Room during their regular Physical Training period.

At the first regular meeting of the class, pupils were given a thorough physical examination. The boys were asked to undress when their turn came for this examination. The examination was performed behind a screen, eliminating the embarrassment which always results when boys have to strip in a crowd. The pupil feels that something is being done to better his condition. With the boy stripped, a skin pencil marking of the posterior spinous processes to determine lateral curvature is made. Shoulders, head and neck, scapulae, chest and abdomen are carefully noted, position of the pelvis, length of the legs, condition of the arches, and any other visual defects are noted. The previous history is taken and the conditions at home are recorded. Under hygiene, cleanliness of body, nails and hair, conditions of the teeth and eyes are recorded and a diagnosis of the condition is then given from the summary of the recording. If necessary, a pedographic print is taken. In all cases photographic pictures are taken with the skin pencil markings in the anterior posterior aspect and in the lateral aspect. These prints are compared with prints taken as progress in the case is noted.

Additional examinations and follow-up were made.

The silhouettograph charts, although not accurate because of the varying position of the subject while taking this graph, and because of the possible unsteadiness of the person drawing, gives to the pupil evidence of his condition and visually shows him that he has a goal to strive for.

The pedograph, for recording conditions of the feet, have shown in a period of two months, in most cases, differences of recording enough to make the pupil understand that corrective gymnastics have had a large part in correcting his condition.

Then we have the forms upon which every pupil is recorded during the process of a thorough visual, pedographic and silhouettographic examination. On these cards are recorded the defects found in the interior posterior views, the lateral position, feet, nutrition, and other physical defects observed. On the reverse side, we write the exercises prescribed for the final diagnosis of the examination. Space is left for the daily hygiene inspection of the pupil, his previous history, home conditions, follow-up and a summary of the entire chart on the drawings of manikins in various poses, for a quick reading of the subject's condition.

Letters, each one personal and pertaining to the individual case, are sent to the pupil's family physician, asking permission or rather his approval for the pupil to take this type of work. In only two cases have we received refusals from doctors, one being a developing cardiac situation, and the other a case in which the boy was able to be operated upon and required absolute rest to prepare him for the operation.

Personal letters are sent to the parents of the pupils, telling them of the work the boy is receiving and asking their coöperation with the homework prescribed.

Syllabus

A syllabus was prepared, to standardize treatment and to provide a basis for the instructional phases of

Scanned with CamScanner

the work. This was necessary, too, so that the pupils might be supplied with printed or mimeographed "Home Exercises."

From the diagnosis, specific exercises are given to correct conditions, with the following acknowledged formula:

1. Exercises to develop flexibility.
2. Exercises to develop correction.
3. Exercises to maintain correction.

It is with this in mind that the syllabus, containing a prescription of exercises, was compiled for each possible condition. We realize that each case is different, and that each case presents its own situation and is further modified by age, sex, temperament and home conditions. These exercises have to be further modified by the available equipment, space and numbers in the class. As a result, the prescription of exercises cannot be used as written, but individual movements must be taken out of the syllabus and presented to the subject to meet his specific demand. More exercises are used as the subject progresses in his correction and this continues until the pupil is discharged as corrected or, in the opinion of the instructor, can be improved no further through this department.

Routine

Assuming that all the pupils assigned to the Individual Corrective Room have been examined, we begin the regular class procedure of exercises. In this department, as the boy is examined he is immediately given his prescription of exercises. In order to take care of the remaining boys who have not as yet been examined, one or possibly two of these exercises are explained to the pupil and he immediately sets out to do them as instructed by the teacher. When all the pupils assigned to this class are examined and one or two immediate simple and general exercises are explained, the teacher begins with the first boy and instructs him in the proper procedure of the next two or three exercises, and so on down the class list until all the boys have been given eight to ten exercises. If during the examination a boy is found to have a very slight condition that would not warrant the individual corrective work, he is sent back to his regular class work. In this way, only the severe cases are given attention. Exercises of a harder nature, and exercises to continue improvement of the specific defect are added only as the teacher may see fit and not because two months or ten weeks have elapsed. This work is highly individualized and restricted and must be prescribed for carefully, keeping in mind the strength of the patient, number of times exercise is to be done, pace of exercise, when to rest, the mental attitude of the pupil, and his reaction to the treatment. Examination of the pupil is held daily in a casual way, and is recorded on the card whenever, in the opinion of the instructor, the patient appears to be ready for such examination and further exercises. In the above method of examination and exercise prescriptions, a cycle system is used. New pupils are admitted, when room is made for him by the promotion of a pupil to regular class work, when, as our department understands, the defect can be corrected no further.

As discharges from the Individual Corrective Room are made, the pupil is sent back to his regular health education work. Other pupils are assigned to take these places by the teacher on the floor. Many of the boys have voluntarily come to the instructor and asked for the privilege of becoming a member of the restricted individual corrective group. The class is easily kept filled and the attendance of twenty is easily maintained. We have found from actual experience that with the individual attention required by each pupil in a class of this kind it is impossible to assist personally every boy during one period or even during the course of three days. Because this personal attention and advice is most important in this work of individual correction, we propose to limit these groups to registers of fifteen.

The department is able to care for lateral curvatures of the spine, "S" curves, structural and specific, lateral tilting of the head and rotation of the head and neck; anterior posterior curves, such as lordosis, kyphosis, a combination of both, and flat back; chest conditions, such as flaring ribs, Harrison's Groove, depressed chest, chicken chest, and flat chest. Flabby, prominent, and weak abdominal walls, strengthening of the ligaments and muscles holding the internal viscera, to prevent and aid in ptosis; correction of the pelvic angle, bowed knees, knocked knees; arch corrections, longitudinal and anterior, bunions, callouses, corns and the various toe defects; correction of many physical defects, visible to the eye, caused by operations, or paralysis, or congenital; correction of mental defects, such as embarrassment, shyness, timidity, in which very fine results have been noted in the correction of nervous stability, through rhythms, proper hygiene, and social contacts with the class and with the teacher. There is a better understanding of the personal hygiene of the pupil's personal ailment, because the teacher can explain the condition of the case to the individual, making the explanation personal, and applying correction to that condition.

In most cases, when a pupil is promoted or discharged we have a protest from him. Every boy is anxious to remain and continue. Outside calls for admission are many. To summarize our project, the results noted and obtained in four months have been remarkable and the attached summary will bear out the value of this service, not only for the mechanical correction and the hygienic and social effect on the pupils, but also for the "carry through" value it has on the pupil in his later life.

Summary of Cases

1. Cardiacs.
   a. Mild functional cases assigned to special duties, involving rest, clerical assistance, infirmary duty, locker room supervision and other duties of this passive type.

Scanned with CamScanner

b. Severe and organic cases are assigned to cots where they spend the entire period resting, asleep or dozing.

2. Personal Hygiene.
   a. Many dental cases completed.
   b. Many cases of new glasses and revision of refractions.
   c. Cleanliness the rule—finger nails, clothes, general neatness, and confident poise.

3. Foot Conditions.

Boy No.	Admitted	Condition	Results
1.	3/17	Second degree right longitudinal arch—dropped anterior arch.	Loss of callousses and arch raised.
2.	3/14	Weak arches, both feet, pain in both feet.	Wears corrected shoes. Pain relieved.
3.	3/2	Second degree long arch.	First degree. No pain.
4.	3/24	Long and anterior arch dropped, caused by weight of boy.	Boy has lost 12 lbs.; pain relieved.
5.	3/2	Long arch.	Absentee.
6.	3/4	Anterior arch, second degree.	Discharged corrected, 5/12.
7.	4/2	R long flat foot.	Discharged corrected, 4/9.
8.	3/6	Long arches, both feet.	Discharged corrected, 4/9.

Summary: 5 improved
3 discharged as corrected
1 no result

4. Anterior Posterior Deviations.
Kyphosis, No. treated, 17; No. improved, 14; partly improved, 2; not improved, 1.
Lordosis, No. treated, 19; No. improved, 13; partly improved, 1; not improved, 7.

5. Summary of Forward Shoulders. No. treated, 29; No. improved, 19; No. partly improved, 1; No. not improved, 7; No. discharged, 2.

6. Obesity.
No. treated, 21. Total weight, 3/15, 2,651. Total weight, 5/10, 2,512. Total weight reduction, 149.
Two boys were discharged, one losing 10 lbs. and the other 8 lbs. Average loss per patient, 8 lbs.

7. Malnutrition.
1. 3/10, 121; 5/10, 124.
2. 4/32, 115; 5/10, 117. Is on a mild diet and tonic.
3. 3/1, 119; 5/10, 123.
4. 3/2, 126, 5/10, 130.
5. 3/2, 96; 5/10, 99.
6. 3/2, 85; 5/10, 87. Bashful and timidity improved.
7. 3/2, 112; 5/10, 115.
8. 3/2, 100; 5/10, 105.
9. 3/2, 95; 5/10, 100. Discharged to class.
10. 3/7, 97; 5/10, 104. Discharged to class.

Total weight, 1,065. Total weight, 5/10, 1,114; gain of 49 lbs. Average gain per patient, 4 lbs.

8. Summary of Lateral Deviations of Spine.
Total number under treatment, 20.
Types of Curves: Dorsal, lumbar, cervical, curves which combine more than one of these regions; many of these curves in a slightly structural state.
Results: Only in one case is the improvement very noticeable. In one other case there is an improvement. The time required to observe improvements in lateral curvatures is considerably greater than in any other type of defect. Therefore the report is nothing more than progress.
NOTE: The reason for the slow progress in this type of defect is the fact that the cartilages between the spinal bodies have undergone a change in shape, and in many cases the bodies of the bone have begun to develop in a wedge shape. It takes a very long time to change bone and cartilage structure, if it can be done at all. Correction can come about by the development of the opposing muscles and the relaxation of the muscles on the side of the curve. If the curve is structural in the second and third degree, plaster casts and operation will be the only cure, although better flexibility and muscle control can be effected with exercise.

9. Summary of Special Cases.
Case A.
Condition noted 4/6. Paralysis of lower forearm and hand. No control of fingers in flexion and extension. Slight limp in walking; stutters. Has had condition 17 years, is 22 years old. Advised by medical profession that because of age nothing could be done for him.
Condition noted 5/17. Complete although not fully controlled flexion and extension of fingers; speech more controlled and an air of confidence and happiness because of possibility of complete use of his arm for future work in life.
Case B.
Condition noted 3/2. Paralyzed for 15 years in entire right side and extremities. Hand is thin, cold, and has absolutely no control of entire organ.
Condition noted 5/16. By applying exercise and massage, the following change has been effected: More weight in arm, arm warmer, now has ability to carry books, because of flexors of fingers. Arm can be raised to right angles. Development of muscles

Scanned with CamScanner

of thorax. A remarkable improvement in three months.

Case C.

Condition noted 4/7. Compound fracture of first and second finger and splintering of metatarsal bones. Fingers healed in a flexed position due to calcification of broken joint and shortening of torn ligaments. Continued pain experienced, especially upon touching finger.

Condition noted 5/17. With passive movements at first, and later massage, and now both passive and active exercises applied, pupil is able to flex first finger and has been relieved of all pain in both fingers. His personal physician recommends that he continue with this form of treatment.

Case D.

Condition noted 4/7. Paralysis of left arm fourteen years ago.

Condition noted 5/5. Improved mobility and strength is evident. Boy is now able to carry greater weights with paralyzed arm.

Case E.

Condition noted 4/7. Walked with shuffling and scraping of feet. No motion in lower part of spine; stuttering; very little motion in ankle joints and stiffness in hip joint. A left total curvature in spine.

Condition noted 5/17. Is able to walk without shuffling feet, gait more natural, better kinaesthetic sense, improved nervous control, shyness disappearing. Decided improvement in flexibility and mobility of spine, hip and ankles. Improvement in general hygiene.

Case F.

Condition noted 3/10. Poor nutrition, nervousness, and especially mental shyness, bashfulness and timidity.

Condition noted 5/10. Social atmosphere and environment and encouragement have made him lose practically all these symptoms of nervous shyness. He mingles with boys in class and answers all questions with assuredness and without hesitating. An excellent example of the value of this work in the promotion of confidence.

SOME GENERAL CONCLUSIONS.

1. This type of work is necessary and important.
2. Many pupils can be aided, either partially or completely.
3. Hope, confidence and poise can be restored to many pupils whose entire outlook on life is clouded and dimmed because of a partial or complete physical disability.
4. Many nervous and "mental case" pupils can be helped.
5. Provision must be made for small groups (10 to 15 pupils in a class).
6. Special teachers should be provided for this work.
   a. Those specially licensed for Individual Corrective work; men and women with clinical experience.
   b. Regular teachers of Health Education to be assigned to clinics for training and experience. In my opinion, this phase constitutes the greatest and most important problem. Pupils are here in plenty, a room and some apparatus can be provided; specially trained teachers are not here. The results are so interesting and gratifying that it would be of great advantage to arrange for this teacher training

DANIEL M. ALPERN,
Chairman, Department of Health Education (Boys).
Textile High School.

THE CURRENT CONCEPTION OF INTEREST

I.

THERE are at least ten elements implied under the term interest. Some of these are constitutive, some are only partly connected. One finds spontaneity and enthusiasm, or the propelling force, the internal motor that makes us do things, the magnetic traits of an object that attract us despite ourselves. Interest is that which makes us pay attention and make an effort. The interesting object permits a facile reaction, one without strain or pain. Still others make interest equivalent to instinct and attention. The current conception of interest is muddled.

And sometimes no definition is attempted; the matter is considered settled. Some treat it implicitly. As one prominent educator said: "Any teacher knows when his pupils are interested."

The term is important. It has implications for the pathologist and the educator. Dr. Max McConn of Lehigh University suggested for adoption, at a conference on student interests, "the idea of the absolute primacy of the doctrine of interest as the fundamental principle which should everywhere be decisive in the process of building a curriculum in the liberal arts and sciences." If such be the aim, do we not need a far more explicit treatment of interest? A theory of interest must likewise be applicable to the vast realm of ennui and of the morosities, to the Hamlets who find this world "weary, stale, flat, and unprofitable."

II.

INTEREST AND ACTIVITY

Dewey has suggestively considered interest in intimate connection with action. He has adopted a broadly behavioristic view. Perhaps one of the causes of the confusion in this subject is the "feeling" view taken by some educational psychologists. It is true that one aspect of interest is a "feeling" tone. But to consider it from this angle is to complicate matters. The sentimental aspect of interest is a later accretion.

Practically, any of the actions above the reflex stage can either be interested ones or uninterested ones. Interest is thus not a trait of any specific act. Rather is it a superstition. Can

Scanned with CamScanner

we not look upon it as a particular way of performing any higher act whatsoever? It thus approaches the rôle of a regulatory act without the clearly marked specificity of stimulus and behavior that the reactions of effort and fatigue present. Then approximating it to these sentimental reactions we can say that interest is not a primary action in response to the external world, but a reaction to that primary action. In other words, its source, its origin, its stimulus is within the act and personality of the actor.

Modifying it by these characteristics, we can accept Dewey's definition, that an interested activity is a unified one, as a working basis. It gives us a valuable hint as to the important rôle of the personality in interested activities.

III.

Interest and Attention

Pillsbury (in "Education as the Psychologist Sees It") says: ". . . it [interest] designates a condition of attention . . . In this sense we may say that interest is a popular name for attention from instinct, education, and mental attitude . . . Interest also designates the feeling of pleasure that results from attending . . . It is truer to say that interest is a word which is applied popularly to different phases of attention, the form that is induced by instinct, education, or attitude and is accompanied by a feeling of pleasure. This is usually designated by the psychologist as the non-voluntary form of attention since it is the type that requires no voluntary effort and at the same time is accepted."

From this I gather that attention is connected with interest, that it is the same as interest in the popular mind. But I can achieve no clear picture of their functional relationship.

Thorndike (in "Elements of Psychology") says, "the original tendencies to attend may be called instinctive interests."

Are attention and interest always concomitant? Are they the same phenomenon? Educational psychologists have not differentiated clearly between them.

Invariably in the discussion of interest and attention involuntary attention is brought up. The interesting things are those which evoke "spontaneous attention." This unfortunate term, for whose popularization Ribot was responsible, is, once the term attention is more rigidly used, of little significance.

The clearest use of the term attention, one which attacks the problem from the "behavioristic" view, is that which considers it a suspension, because of a given aim, of the activation of a tendency. Janet gives the example of a fox who is waiting immobile at the burrow of a concealed rabbit. The fox does not jump because its jaws would close upon the air. The fox suspends the act of bounding upon the rabbit. In active inhibition of the act effort plays its rôle. Secondary acts intervene. The field of awareness is limited. This is the primitive act of "le guet." In a higher form we have the act of research. In the above example the animal would not be content to await the appearance of the rabbit, but would try to hasten its appearance by other secondary acts such as prowling, clawing the ground, and sniffing. I call them secondary acts because they take their origin in the primary act itself, that of pouncing on the prey. The act of attention is of a similar nature. It is an arrest of the complete activation, having as its most prominent secondary action the limitation of the field of consciousness. The tests of attention illustrate the similarity. The subject is asked to strike out a letter. He does not pounce upon any letter whatsoever, but waits for his particular victim to appear. To sum up, attention is the suspension of an activity in its lower phases in order to permit its successful consummation at a later propitious time.

The so-called involuntary attention is no attention at all. It is the simple consummation of a heavily charged activity. The child eating a sweet is not necessarily an example of involuntary attention.

As illustrated in the quotation from Pillsbury, interest is commonly supposed to be the accompaniment or the cause of involuntary attention. We should prefer calling it, in the examples usually given, the accompaniment of the primary activation of a heavily charged tendency. There is no suspension in these acts.

Does interest always accompany attention, as is implicit in most discussions on this subject? This is hardly tenable. We have only to reflect on those necessary but annoying acts whose complete activation we suspend so as to consummate them more effectively at a later date, and which are performed without interest.

On the other hand the converse must be true: attention is the constant and inevitable accompaniment of interest. Perhaps an exception should be made of those impulsions which, under rare conditions, find the object of their activity so situated that their consummation is immediately effected. Are these acts, however, interested ones?

IV.

Interest, Effort, Fatigue and Triumph

The popular mind has long contrasted effort with interest. In his discussion ("Interest and Effort in Education"), Dewey conclusively showed that there was no antagonism. Rather, by numerous examples he indicates how effort goes hand in hand with true interest.

However we find this: "The theory of effort means a virtual division of attention and the corresponding disintegration of character, intellectually and morally" ("Interest and Effort in Education"). I cannot see how Dewey could have reconciled this with his other view. It flows from a misconception of the most important phenomenon of effort.

There is a suggestion, in nearly all books on educational psychology, of disdain for effort. When we have attained a perfect methodology, they seem to say, then the necessity for effort will have disappeared. Some of

Scanned with CamScanner

the difficulty arises from the assumption of different viewpoints. Even Dewey, who assumed throughout a behavioristic view, considers effort as a *feeling* of strain, as something inherently disagreeable.

Primitively, effort can and should be defined in terms of behavior. (Behavior in the sense of the total reaction of the organism.) I am here presenting the theory of effort expounded by Pierre Janet in his epochal work, "De l'Angoisse à l'Extase," especially the second volume, "Les Sentiments Fondamentaux."

Effort is an acceleration of an action. Not that we are talking loudly, but that we are talking more loudly: not that we are running fast, but that we are running still faster—it is this addition to the primary action which constitutes the secondary reaction of effort. Considering effort in this light permits us to view it as a phenomenon subject to various stages of evolution. When this reaction attains the level of conscious behavior, we have the sentiment of effort. To the primitive reaction of effort we add a more clearly defined goal, desires, hopes, and the like. Effort is not in itself painful, as is implied in most treatments of the subject. Its alternation with fatigue gives it sometimes a painful aspect. But have we not the joyful effort of the successful artist?

What gives rise to the reaction of effort? Primitively, it is the inadequacy of the primary action which arose as a reaction to a stimulus from the external world. The dog which does not reach the meat held out to it by its master jumps still higher and invents the reaction of effort.

To sum up: the external world, through a stimulus, evokes a primary action. In some situations this action is not enough to reach a satisfying culmination. To render the act more efficient, a secondary reaction to the primary action is employed; the reaction of effort.

From this brief sketch of effort two facts relevant to interest emerge. An act performed with effort can also be a unified act; an act performed with effort invokes that effort temporarily. These facts necessitate the revision of the definition proposed before, so as to make it specific for interest alone. An interested activity becomes one that is a unified permanent one which we have accepted as part of our personality.

The causal relation between interest and effort is postponed to a later section. But it can be said here that interest is a later stage, coming after the stage of effort. It appears when certain conditions are met. Chief among these is the reaction of triumph.

In contrast with the positive correlation of effort and interest we have the negative one of fatigue and interest. The appearance of a fatigue is the signal, unless replaced by the reaction of effort, for a diminution of interest. The interesting object loses its significance. It is to be noted that such variations of interest are difficult to understand as a mere reflection of a change of the external world. This has an important bearing on the causal function of interest.

The sub-normal has few interested activities; the patients who are victims of the "sentiment du vide" are bored. No special means are required to attract the intelligent pupils to the abstract work of the classroom. The range of interested activities of a Goethe is wide. The contrast between his activities and the narrow field of consciousness of a hysteric is significant.

The "Interesting" Aspects of Some Objects

An object is interesting in so far as we perform certain acts in connection with it. To some objects we may not react at all. To others we react but without interest, and to still others, probably fewer, we react with interest. As indicated in the last paragraph, the able have a large number of such reactions; the deficient, a small number.

The activation of congenital tendencies is usually accompanied by interest; it is to be noted that they are heavily charged, and that they are for the most part triumphant ones.

The objects of such instinctive, interested activity are pre-determined. We therefore objectify our interest, and consider its bearers, through a poetic fallacy, as possessing a magnetic power which accounts for the efforts we are ready to make in their behalf. By extension we have the doctrine (at least implied) of inherent interest. The man in the street says "this thing interests me" when he ought to say "I interest myself in this thing." The pedagogue commits the same error when he says "let us make this work interesting for the pupil."

The interesting quality of objects is a human creation. Because of instinctive activities common to all, similar objects appear of interest to everyone. This is objectified on to the thing itself and we say, "it is interesting." The analytical effect of disease in the morosities and the experimental studies of fatigue show the fluctuation of interest with the variations in the disease and demonstrate conclusively that interest is no direct reflection of the external object. It is rather an objectification of a behavior, an investing of an object with the qualities of a subjective behavior.

Interest, Interests, Causality and Pedagogical Applications

There has been an attempt to involve instincts in the educational process so as to make school material interesting. For example, we endeavor to teach through an appeal to the play tendency. Children are always interested in playing (at least the normal ones). Why can we not "tap" this interest for the purposes of education? Averill says ("Elements of Educational Psychology"): "Even James and Henry, whom I very well knew to be notorious idlers in the schoolroom, were transformed under the influence of the sport into personified eagerness itself . . . and this same James failed of promotion last June." Referring to a similar incident the author asks: "Can we harness this energy?" And

Scanned with CamScanner

later: "Surely it is no more difficult to follow out a project in arithmetic or in hygiene for an hour than it is to spring after a football or to dig in the garden." . . . "Is it, then, not possible to introduce in our school life motivation of a nature similar to that which operates on the ball field, or in the back yard, or on the playground? To answer these questions is to call to witness Nature's great driving forces: the instincts."

To answer Mr. Averill's questions (restricting ourselves to this trend), is rather to ask ourselves what play is.

This psychology started that epidemic of play schools, that enormous emphasis on dancing that was to express the children's soul, that stress on building "rabbit hutches." Old Aristotle and his reply to Alexander, "there is no royal road to learning," were forgotten. In this imperfect world there is no play to learning.

Play is not serious. That is perhaps its most striking aspect. The aims of most actions are the modification of the external world. But the player does not attempt to do this. This is so true that we reprove him who takes the game too seriously; we have amateur organizations to prevent the game from becoming too grave.

If the player does not attempt to modify seriously the external world, what does he endeavor to do? He attempts to be successful. Play is a method for the false exploitation of triumph. If we lose at a game, the penalties for the loss are not the serious losses of a grave life situation. That is why people are objecting to inter-collegiate football; it is too serious, the stakes are too great. It is no longer a game.

As indicated in the previous section, it is the reaction of triumph which permits the appearance of interest. A tendency like play, whose essential aim is the evocation of facile triumph, cannot but be interesting. We can play at being mothers, firemen, cowboys; we can play at being in love, we have the pathological play of the artistic dreamer. All these activities are absorbing, interesting. We can have all the triumphs of the cowboy without any other danger. Does Mr. Averill want his students to play at their studies?

The enthusiastic French teacher opens his lesson with the much touted *realia* such as the pair of Breton sabots which he has collected on his last trip abroad. The class is enthusiastic, even the dull ones. But alas, he has to return to the reading lesson, or to the grammar, and the dull ones relapse into fathomless boredom.

The preceding discussion on play could be repeated for the attempt to involve primitive tendencies in the scheme of education. The hormic psychology of MacDougall has conquered the educational world. The picture of a little dynamo within us creating energy which only needs to be "tapped" (magical word) has proved too fascinating to be applied cautiously.

This brings us to a consideration of an *Interest*. So far we have been talking only of interesting activities. One of the main aims of a modern

education is the establishment of permanent interests. An interest is a matter of objectification. The interesting activity has an aim, an object. It is the announcement that a particular object seems to possess magnetic qualities which draws us on. It is these magnetic qualities that the objects of instinctive activity spontaneously possess.

Throughout books on educational psychology it is implied that interest is causative of attention and effort. In the case of certain activities this is immediately true; for example, the objects of instinctive activity (although it is necessary to make exception for pathological cases where disease has apparently diminished the charge of the instinctive tendency). In these cases disease shows us the human creation in the constitution of interest.

But the objects of higher intellectual activity are not immediately interesting. Interest is not an initial phenomenon. The teacher cannot start with it. It is an end product. These objects require the application of the reaction of effort. They require the intervention of the personal tendency. This seems to me the preliminary phase in the establishment of an interest. But effort is a temporary affair. At a certain stage there may occur the establishment of interest. It is an announcement that this particular activity is incorporated into the permanent activities of the personality. What permits the establishment of this epochal announcement? It is the result of a period of fumbling and groping; the possibility of triumph becomes evident, the reaction of interest appears and an Interest is attained. From this point on the interest plays a causal rôle; for its sake, we are willing to make all the efforts, pay all the attention that its successful consumption requires. But primitively the reaction of effort must precede interest. A period of incubation is required.

Case material from the realm of those suffering from what Janet terms the "sentiment du vide" (the sentiment of the absence of all sentiments) is particularly instructive. These people have lost all interests. Nothing is worth while, everything is tedious. They have reduced their life activities to an ascetic minimum. At the same time they never present the reaction of effort.

Henry, who came to me because he disliked German because it was uninteresting, was given permission to drop the subject or to continue and do all the work, regardless of its boring quality. He has done this work with a moderate degree of success. He naively remarks now that German has become more interesting. Little Fred with an I. Q. of 85 says: "Maybe if I could become more interested I could pass my subjects." But Fred with his mentality can never attain the reaction of triumph and can never become interested. Roland tells me that the first week of any subject is interesting, but not after that. Investigation shows in him a widespread tendency to that premature reaction of fatigue, in all life activities.

Scanned with CamScanner

The implications for the school are considerable. Let us realize that the establishment of permanent interests is a complicated matter. The naive idea of "tapping" the easily evocable energies of the primitive tendencies has received incautious extension. In these tendencies we have congenitally transmitted interest in whose name all the energies of the personality may be mobilized. But the objects of these interests are comparatively definite and no magic aid can transmute them into scholastic objects. The attempt has already been made. The endeavor to teach through play is an example of this. But the child will not accept as play the instructional games of the adult and soon deserts them for the old rag doll.

Certain objectives are laid down. How they are chosen need not be here discussed. The child, in order to attain them, must attend, must occasionally react with effort. The objective is mastered. In some of our pupils (a select minority) a permanent interest will have been attained. The other members of the class will have acquired a certain amount of information, a certain attitude. But they have not attained a permanent interest. They are not capable of doing so. And no amount of *realia*, of special methods will create this interest. Because interest cannot be created by a teacher, the individual pupil has to produce it for himself.

This conception of interest does not absolve the teacher from an active share in the process. He is there to present the subject in a clear light. He can show the material in a novel manner. He can employ any device to attract attention. Then there must enter upon the scene the reaction of effort to maintain this suspension of activity. In some cases this process will be crowned by interest.

There remains the question of the selection of the curriculum. It has been maintained by Dewey that with the proper curriculum there would be no necessity to have recourse to "artificial" means of making a subject interesting. The subjects would be intrinsically interesting. This is true if we can define the word "proper." Is the proper curriculum the one whose subjects permit the reaction of triumph to all (and of attachment of that activity to the personality of the student)? The adoption of such a curriculum would solve the problem of the creation of interests. But are there not some subjects with which the well educated person should be acquainted regardless of his ability to attach such a subject to his personality?

LEO A. SPIEGEL.
Abraham Lincoln High School.

THE HUMANIZATION OF AND BIOGRAPHICAL APPROACH TO THE TEACHING OF CHEMISTRY

IN the search of means to stimulate interest in the study of chemistry, the biographical aspect and the humanization of the subject loom up as vitally important. The oversight of these factors too often leaves a wide gap between the teacher's presentation and the student's mastery.

Logical methodology in the development of a scientific concept necessitates an exposition of its evolution from its inception. It is in this direction that sufficient emphasis on the lives, personalities and contributions of the great scientists becomes a *sine qua non* of inherent interest on the student's part. Such treatment of chemistry will bring nearer home and render familiar what are only too often detached abstractions.

The human beings known as chemists are men possessed of supreme technique and guided by patient experimentation to subjugate matter to their powers of analysis. The application of their methods and their labor evolved the basis for what we now call chemistry. Matter would still be dust but for their lives and works.

It is they who through hundreds of years have gradually enriched scientific thought and widened the chasm that separates man from his animal relations; have given him a more intelligent understanding of life and a more universal appreciation of life's ramifications. Without them chemistry would never have come into existence. Narrating the part played by them is a most important aid to the student's ability to cope with and grasp the subject. We must understand before we can control.

Francis Bacon said, "The history of the world without the story of man's education is like a figure of the mighty giant Polyphemus with his single great eye left out." The subject matter, robbed of its source and the story of its sponsors, leaves it like a water color drenched by rain. The human appeal of chemistry is left obscure by its barren presentation. If scientific knowledge is to reach a fair proportion of the students and the scientific mood is to be widely cultivated, we must have a historical background of the subject.

So noble a chemist as the late Dr. Wilhelm Ostwald, in his "Klassiker der Exakten Wissenchaften," prefaces his treatise with the following significant statement: "While by the present methods of teaching, a knowledge of science in its present state of advancement is important, very successfully eminent and far-sighted men have repeatedly been obliged to point out a defect which too often attaches to the present scientific education of youth. It is the absence of the historical sense and want of knowledge of

Scanned with CamScanner

the great researches upon which the edifice rests."

These lives and their works should form the foundation stone of the study of matter and life itself. The fundamental importance of this contention has gained ever-increasing recognition by leading educators. This interest has manifested itself in the ever-increasing space allotted to it particularly in the high school text-books. The space and time devoted to the lives, works and accomplishments of these pioneers is fully compensated by the constructive purpose they service. There can be no substitute for the many fruitful usages to which knowledge of the lives, pursuits, and achievements of Lavoisier, Mendelejeff, Dalton, Arrhenius, Berzelius, Langmuir and many others can be put. These men made chemistry; it was not part of them but all of them. Chemistry without them becomes lifeless and static.

In as much as chemistry is considered a most vital factor of life, there is no justification for omitting this purpose in so fundamental a subject. And yet with all this understanding and effort in that direction, it seems paradoxical that so few teachers avail themselves of so urgent a portion of their program. These pedagogues have lost sight of a very noble precedent which the very fathers of chemistry pursued. In the accomplished work of these very leaders, it is well observed that the first step in their pursuits was to scrutinize the lives and undertakings of their predecessors.

Many attempts on the part of leaders in chemistry have been made, particularly in recent years, to satisfy the lay mind in its demand for chemical knowledge. An obstinate barrier was the lack of humanization of scientific writings. Another was the lack of adventure that surrounds the subject—an adventure which so readily incites the mind to strive for further knowledge. The successful obviation of these obstacles has manifested itself in the innumerable followers of chemical thought and the many popular chemical books which have found a vast appeal among the great mass of people. Leading newspapers and magazines devote more space to chemical matters, and the tendency to generalize abstractions by biographical and humanizing aid has been so widespread that even to the layman chemistry has become universal and replete with interest.

The student in his quest for knowledge seeks delivery from ignorance. For this accomplishment the humanization of knowledge is of vital importance. Perhaps the greatest illustration of the noble and humanistic aspects is portrayed by the examples of the lives and deeds of the chemists themselves. Where else would one find such combination of heroism, disinterested devotion to truth, methodical determination, coöperative endeavor and delivery from ignorance?

Subject matter in chemistry, considered by itself, is void of human approach. The attention and interest must be enlisted. The human mind is very susceptible to narration. This very congenial form is a most applicable means for approach and development. This method of historical and evolutionary approach, having weathered the storms of tests, is of fundamental significance as an aid in the humanization of chemistry. It may appear as a far fetched generalization. But to dismiss this erroneous concept we must not permit ourselves to be victims of an outlived promise. For it has been an accepted fact that scientists seem to prefer to forget that a general idea is by no means necessarily a superficial idea. No, indeed; it is long since we have, with resentment, rebuked this unwarranted accusation, for we have long proved in other fields of endeavor that in a general idea there may indeed be a very fundamental idea. It is only through such adaptation that we may dismiss any tendency from the student to have formed lifeless notions of chemistry, and his failure to see the way of weaving them into the scheme of things.

"In order to accomplish this, or at least to advance towards its accomplishment, our knowledge of man and his world must be reordered and restated; it must be put together anew with full regard to the ways in which the average person assimilates new knowledge. It must be synthesized. Thus the student will understand the conditions essential to develop such abilities, inclinations and ideals as may qualify him to an intelligent and effective grasp on the subject matter."

"When one has gone through a text-book and safely weathered the examination, he rarely has any further use for it. This is not because he has really absorbed it and so need not refer to it again. On the contrary it is associated with a process alien to his deeper and more permanent interests."

"The 'principles' or 'elements' of a branch of science are really the ultimate outcome of a knowledge of it, not the thin edge of the wedge which insinuates it into our minds."*

Instead of the tendency for the subject to be looked upon as "cut" and "dry," the described modifications to each lesson that permits of same will bring a richness and flavor for deeper interest.

Presentation of these vital factors of instruction in chemistry will enrich the many purposes of the subject. The student will derive profit by learning the mind, the method, the enterprise and the energy of the great fathers of chemistry. He will be stimulated by these examples to become a faithful guardian of his inheritance from the past, and himself a zealous worker for its advancement in the future.

HIGH POINTS

The Teaching of Types of Municipal Governments

For the past year or so there has been a revival and a stimulation of interest in forms of municipal organization and management.

This interest has been nourished by frequent editorial comment, the Seabury recommendations, and public addresses, such as the one delivered by the City Manager of Cincinnati at the Town Hall. It has been a rare opportunity for the Civics teacher, and many have made pedagogical capital of it. I am sure that many felt, as I did, that it was a civic obligation on the teachers thoroughly to familiarize their classes with alternative forms of city governments, and to work up interest in this subject among their students to a plane that would be consonant with and appreciative of the attention the subject was receiving in the press and on the platform.*

Very often the teaching of the various types of municipal administration becomes for the child a theoretical discussion of governments said to exist in vaguely distant places. The class discusses the characteristics, advantages, and weaknesses of each of the forms — Commission and City Manager governments—but it seldom displays any sense of genuine intimacy or sympathy with the subject. It was this absence of intimacy and the apathetic attitude that it almost always engenders that I sought to correct.

I divided the work into two periods, devoting the first to a short, preliminary discussion on the Mayor-Council form, typified by New York City, and to a more thorough discussion of the Commission type. The second period was given entirely to the City Manager type, more time being devoted to it because it is for teaching purposes clear-cut, more interesting, a form growing in favor, and because it was recommended in one of its forms by Judge Seabury in his report to the State Legislature. There were obvious limitations. I had neither the time nor the facilities for any elaborate experiment. In a limited way the city and its functionaries were simulated in the classroom, but this was only incidental.

A description of the second lesson will explain the plan and the procedure:

The background for this lesson lay in the discussions of the day before. For motivation I read the class the first advertisement for a City Manager ever to appear in the columns of American newspapers. The advertisement, issued by Sumter, South Carolina, in 1912, is short, interesting, dramatic and contains the essence of the whole municipal experiment. Textbooks are opened, and from it the class can get by a quick reading all the factual material about City Managership condensed in a paragraph. Five students nominated to act as Commissioners are asked to list the qualities they will demand in the Manager they will hire. The class (citizens) offer their suggestions to the Commissioners. Objections are voiced which must be dismissed by a cogent argument, or accepted and incorporated in the Commission's policy. The problem then is to decide how much power is to be invested in the Manager. Opinions vary widely on this point, and almost every angle of the question is argued so heatedly that even the most stolid "citizen" is constrained to rise and tell the Commissioners exactly what he thinks of them and their policies. Often he presents a telling argument and defends it with more good sense and enthusiasm than he has displayed before. The advantages and disadvantages of City Managership are debated along the same lines.

What is the teacher doing during all this? In this case he is an encyclopedia of interesting information on the subject of City Managers. He knows the details of the careers of several City Managers. He knows their salaries, their duties, the work they have done, where they have failed, and where they have been successful. While the class is discussing what should be under this system (theory), the teacher is interpolating at every turn in the discussion what actually happened and is happening (practice). Small but significant details, names and places are mentioned glibly and profusely, not as information to be learned, but rather to lend reality and attractiveness to the lesson and divorce it from the purely hypothetical. If the debate comes to an impasse, the teacher can explain that in Forest Park, Illinois, or in Dayton, Ohio, such a plan is followed; or, that in Cincinnati, Ohio, and in Rochester, New York, slight variations have been introduced to make the plan meet a particular condition. The actual practice carries much weight with the class and is often the determining argument in the debate.

The acquisition of this fund of information demands some effort on the part of the teacher, of course, but not so much as to render the procedure impracticable. A great deal of it can be found in standard books on municipal government. There is some fine, monographic material available on both Commission and City Manager plans. The best sources, however, are the monthly issues of the *National Municipal Review*, *American Cities*, and *American Municipalities*. A casual reading of these periodicals from time to time will acquaint the teacher with all the newer developments in American local government and will offer him the basis for a very engrossing, instructive and lively lesson.

The Use of the Thought Question in Economic Geography

A fact often ignored by high school teachers is that adolescent students as a group are strongly attracted by an instructor who makes them think. It is the teacher who neglects to provide his class with frequent opportunities to employ their reason who finds his pupils listless, dull and unresponsive.

Undoubtedly the most obvious means of inducing thought in the classroom is the use of that frequently discussed topic of faculty conferences, but in many cases rarely employed teaching device, namely, the thought question.

But adequate thought questions unfortunately do not rise spontaneously in every teacher's mind, but presuppose careful reflection and preparation on his part. Probably this is the principal reason why many of our economic geography classes are mere exercises of memory.

Since man is a rational animal, he yearns for questions which will require him to use his distinctive faculty, the intellect. Is it any wonder, then, that the large mass of high school students actually welcome thought-provoking questions, and strongly resent a never-ending barrage of dry, tiring, ever-popping memory quizzes?

Professor Monroe of the University of Illinois has made a classification of twenty different types of thought questions. Seventeen of these types are directly applicable to the social sciences. Several years ago Eugene B. Riley, of Thomas Jefferson High School, in an issue of HIGH POINTS, showed their use in courses in Economics. It is my purpose to point out their applicability to courses in economic geography.

Any teacher who has observed restless students in the classroom can not fail to remark their amazing energy and vitality. That type of thought question which utilizes this remarkable fund of youthful aggressiveness is the one given the name "Decision for or Against." For example, "The Central Region of the United States will supplant within a century the Northeastern Region as the leading manufacturing region. Do you agree or disagree with this statement? Give reasons." In this question there is a striking personal appeal. "Do *you* agree or disagree" John has been asked. He feels a certain gratification for having been granted the opportunity to tell his classmates *his own* view of the matter.

The teacher may then call upon others to criticize John's answer, or certain features of his answer. To this type of question Professor Monroe gives the name "Criticism." Examples of this kind are: "The manufactures of Germany reveal the artistic temperament of the German people, while the manufactures of France reflect the scientific character of the French. Criticize." "The Philippines are more important economically to the United States than Cuba is. Criticize."

By such questioning the recitation is socialized, topical recitations are secured and the experiences and interests of the pupils are utilized. During the course of the discussion, such desirable traits as initiative, tolerance, and suspended judgment might readily be developed by judicious questioning. Thus it is that the teacher is no mere hearer of the text-book, but is in a very true sense "the director of the teaching process." Moreover, since each pupil is required to substantiate his judgment by the facts of economic geography, the essential elements of review and drill have not been overlooked.

Third type, "Selective Recall": "Name the agricultural products which are common to both California and Florida." "Mention the industries of the United States which would most likely gain by the independence of the Philippine Islands."

Fourth type, "Evaluating Recall": "Name the countries of Europe which depend on the tourist trade as an *important factor* in their economic life." The evaluating factor in this question is the degree of importance which the various European countries attach to their respective tourist trades.

Fifth type, "Comparison of Two Things on a Single Designative Basis": "Compare New England and the Southern Region with regard to their relative advantages and disadvantages for manufacturing cotton."

Sixth type, "Comparison of Two Things in General." "Show that St. Louis and Chicago are similar in their principal industries."

Seventh type, "Explanation": "The construction of the Panama Canal has increased the commercial importance of the Philippines to the United States. Explain." "The Hawaiian Islands are called a racial hodge-podge. Explain." This type is rather commonly used. The class may be asked to explain an entire statement, or a single phrase or clause of the statement.

Eighth type, "Summary": "Show that France is more self-sufficient economically than England." Such a question involves recall and comparison of the chief products of each country, organization, judgment and conclusion.

Ninth type, "Analysis": "Account for the commercial backwardness of China."

Tenth type, "Relationships": "Show the connection between the American automobile industry and the topography of the Central Region."

Eleventh type, "Illustrations or Examples": "Give two examples of the reclamation of arid soil by means of irrigation schemes."

Twelfth type, "Classification": "List five different reasons why Paris is the fashion center of the world."

Thirteenth type, "Discussion": "The champions and opponents of the proposed St. Lawrence Waterway are largely moved by their own economic interests. Discuss."

Scanned with CamScanner

Fourteenth type, "Outlining": "Trace the different steps required after the planting of the cottonseed in order to produce a piece of finished cotton goods."

Fifteenth type, "Reorganization of Facts": "Beginning with the mining of the iron ore, recite the autobiography of a high grade steel pocket knife." This type of question is an attractive and effective device in review work.

Sixteenth type, "Causes and Effects": "In the beginning motion picture production was localized in New York State. Why has the industry shifted to California?"

Seventeenth type, "Formulation of New Questions on the Part of the Pupils". This is a most valuable type of question for it is a realiable indication of thoughtfulness on the part of the pupil presenting the question. For instance, in dealing with the relative self-sufficiency of France and England, students usually raise the question: "Why does not England raise her own foodstuffs instead of depending on her possessions?"

In retrospect, therefore, let it be repeated that there can be no brief for the teacher who, in spite of the multiform possibilities for stimulating thought, nevertheless regards economic geography as nothing more than a congeries of memorizable facts.

BRENDAN BYRNE.
John Adams High School.

A Report on Experiment in Memory Work in German: The Learning of Prose and Poetry and Its Retention

In performing this experiment, care was taken to keep the situation as free as possible from any factor which would tend to invalidate it. The selections of prose and poetry for each grade were as equal as possible in the number of words and the degree of difficulty in vocabulary and thought content. The material was presented to all classes on the same day without previous announcement. All learning was done in class, one period each being devoted to teaching poetry and prose. Only those pupils who succeeded in learning the material within that period are included in the successive counts to obviate the possibility of any "studying up" later. Pupils were not told that they would be tested for retention and each test was given unannounced, again to obviate the possibility of previous preparation in order to make a good showing. Retention in each case means complete retention, partial knowledge is not accounted for. The poetry test was completed before the prose was begun. The time intervals between the tests were the same in both cases.

Below is shown the tabulation by terms:

POETRY Grade	No. of Pupils	No. Who Knew Passage at End of 40 Min.	No. Who Had Retained on 3rd Day	No. Who Retained on 6th Day	No. Who Retained on 11th Day	No. Retained on 20th Day	% of Class Who Learned in 40 Min.	% of Learners Who Retained 21 Days
1	112	95	89	87	78	71	84.8	74.7
2	111	81	78	71	66	62	72.9	76.5
3	173	143	119	108	103	94	82.6	65.7
4	146	114	108	106	105	102	78	89.4
5	101	93	68	67	65	65	92	64.3
6	89	78	65	62	61	60	87.6	76.9
TOTALS	732	604	527	501	478	454	82.5	75.1
PROSE								
1	112	100	87	82	75	59	89.2	59
2	111	85	76	71	64	60	76.5	70.5
3	173	160	121	109	100	93	92.4	58.1
4	146	81	74	69	67	61	55.4	75.3
5	101	90	67	65	63	60	89.1	66.6
6	78	77	64	61	60	59	98.7	76.6
TOTALS	732	593	489	457	429	392	81	66.1

Results. The results would tend to the conclusion that in general it makes no appreciable difference in learning whether the material presented is prose or poetry. There were several instances in which a given group did better with prose than with poetry. The average percentage is only 1.5 in favor of poetry. In retention, however, only one group made a better showing with prose than with poetry, a difference of 2.3. In general, poetry was retained better than prose, with an average of 9% in favor of poetry.

MAGNA A. GRAY,
Chairman, Department of German.
Stuyvesant High School.

A Contract Reading Plan For First Term American History

The following plan is an attempt to develop new techniques in the matter of reading habits and to develop permanent reading interests. The old system of asking the student to read books which he finds upon the book list and to keep a set of study notes still furnishes practice in such habits as retaining facts read, finding supporting details, comparing, evaluating and organizing. Pupils now, however, show more independence and ability in individual reading for class reports, in debates and discussions. Hence the plan attempts to give direction and open up a wider horizon to the read-

Scanned with CamScanner

ing habits which may already be formed.

Stress is placed upon phases of American Life which are ignored in the text-book (e.g., Women in American History). Emphasis is placed upon the life of a man in contra-distinction to the old political-military approach.

Individual differences are provided for by the presentation of a list of different topics, each having a wide range of reading references.

In fact, a capacity course for every degree of ability is furnished as follows. A list of 17 topics in American History is submitted to the student. A bibliography is included. Each book referred to may be procured in the Boys High School library. Often definite page references are made to the works mentioned. Consequently the student knows what to find and where to find it. Three topics must be completed by the end of the term. Limits are put on the dates for handing in the results of their reading.

A list of instructions for writing a term paper is posted in the classroom and one in the school library.

Instructions

1. Below are 17 suggested units of work. You are required to complete any three units.
   The first is due October 21.
   The second is due November 25.
   The third is due January 14.
2. The requirements for a grade of "A" are:
   a. Three topics finished.
   b. Five two-minute speeches in class.
   c. Draw a map.
   d. Five-page report on each topic.
   e. An additional activity, such as a one-act play, an original poem, clay models, collection of illustrative material.
3. The requirements for a grade of "B" are:
   a. Three topics finished.
   b. Three speeches in class.
   c. Five-page report on each topic.
   d. Map, chart or diagram.
4. The requirements for a grade of "C" are:
   a. Three topics finished.
   b. Three speeches.
   c. Five-page report on each topic.
5. The requirements for a grade of "D" are:
   a. Three topics finished.
   b. Five-page report on each topic.
6. Each report must consist of:
   a. Title page.
   b. A table of contents.
   c. Content of essay.
   d. Bibliography (list of books used).
7. Practice intellectual honesty. When you quote or copy a passage from a book, state at the bottom of the page the author's name, the title of the book and the page number.

8. You must present evidence of having used three different works in each report.

Topics

1. *The American Indian.*
   Chronicles of America, Vol. I. The Red Man's Continent.

WALTER L. WILLIGAN.
Boys High School.

An Experiment in Vocational Guidance

The choice of a profession, trade, or job of any character has always been a difficult one for high school graduates to make. Too often the selection of the individual's life work is a matter of chance, and we have any number of square pegs rattling about in round holes for the major part of their existence. To overcome this difficulty to some slight extent, boys in the June, 1932, graduating class of the Port Richmond High School were given an exceptional opportunity to become better acquainted with the lines for which they expressed any inclination.

Mr. William M. Halloran, the Principal of the high school, coöperated with Major W. B. Lewis, the Chairman of the Vocational Guidance Committee of the Kiwanis Club. Major Lewis came to the school one afternoon and talked with the senior boys, emphasizing the need for care in choosing a vocation and for adequate training and preparation. He outlined, too, the plan evolved by his committee for aiding the boys.

A statement of his hopes for future careers was obtained from each senior boy. These were classified and tabulated and turned over to Major Lewis. Then he developed a schedule of field trips and interviews so that each student might observe and discuss actual performances in the line of work in which he was interested. After the customary notes from parents were on file, the boys were excused from school, if necessary, for the time needed for their particular interview or excursion.

A number of varied trips were arranged. A boy who wished to be a printer was shown through a local establishment and had explained to him the various machines and the tasks of the different operators. The future lawyers and journalists attended a session of court in company with a practicing lawyer and reporter. Those who hoped to become physicians visited a hospital, and a busy doctor took time to show them through the great institution. Electrical engineering had fascinated several, and these were taken through the largest plant of the Staten Island Edison Company. One June morning a contractor and civil engineer was laying out an athletic field for a private school. The boys were allowed to try the surveying instruments, and talked with the workers. One evening seven of the boys who had felt the call to aviation were invited to the United States airport at Miller Field in New Dorp, where they investigated planes, saw the latest devices for radio communication in blind flying, and talked with the army aviators.

The boys truly appreciated the opportunity offered them. They declared that the trips had afforded them not only an enjoyable time but a profitable and inspiring one. Each had gained a clearer insight into the problems and operation of some particular phase of his field. Practical field trips and interviews such as these are difficult to arrange, but immensely helpful in making a decision upon a future course and in planning the training necessary to secure some longed-for goal.

Port Richmond High School.

Strategy in Review

The following bit of strategy was devised to infuse new interest into a lesson that needs review:

At the beginning of a review period, as the children "trickle" in from their previous classes, place a neat pile of paper on the front desk of each row. The significance is quickly comprehended. No examination having been announced, hurried glances through the text-book reveal the fact that help from any source would be welcome, even from the teacher.

"How about a little review before we begin?" This is just exactly what the last hurried look into the text-book hoped to achieve. Instruction can never be more fruitful than when the need for knowledge presses. This is the "readiness" emphasized by Thorndike. What a relief!

Then follows a thorough review of as much work as can be covered in one period, allowing sufficient time for the expected test. Should the drill consume too much time, the pupils will be glad to take the test at the next meeting, when it must positively be given.

In actual practice this stratagem results in a rapid attack on the problem in hand, and an elimination or diminution of the "warming-up" period. The mental set is instituted at once. Attention is at its maximum. Self-

Scanned with CamScanner

activity reveals itself in the very posture and questioning of the pupils. Relief from an immediate exposure of actual or believed ignorance is followed by an interest in the situation which is bound not only to raise test scores, but to result in better retention because the emotions having been involved, the impression is deep.

Julia Richman High School.

How to Make a Book Report in the Social Sciences

I believe that teachers in the social sciences should assign to the student only those readings which can aid the student in understanding the existing social order. The assignment must arise out of a felt need and should be introduced as a vital part of the work of the class. I believe also that the student should be assigned at least once a term a full book to read, rather than a topic and a number of pages. The student should be taught to evaluate critically his reading. With this plan in mind I offer the following outline to guide the student in attaining this critical attitude:

1. The Book.

   Give the exact title of the book, the author's full name, the number of pages, and the date of publication. Also give the name of the publisher.

2. The Author.

   Give a short résumé of the life and the position of the author. Is he qualified to write on this subject? In what way? Has he prejudices? What incidents in his life show these?

3. Content of the Book.

   Take notes on cards of the important assertions in the book. Note the chapter headings; also note the proofs which the author gives for his assertions.

   Are the proofs based on original sources, on interviews (if so, with whom?); on the writings of other authorities in the field; or are they a combination?

   Has the author found new material, never before published? If so, what?

   Now with your cards before you, put briefly in your own words the author's story.

4. Excerpts.

   List the quotations that you think are worth remembering, startling statements, pictures, diagrams and anecdotes.

5. Criticisms.

   What criticisms can you make of the book?

   Does it fit a felt need? (Find out what other books are in the field by consulting the librarian.)

   Is it biased? Is it too idealistic, too bombastic, too descriptive, too detailed, too radical, of the panacea type, too superficial (assumes too much without offering proofs, or suggests remedies of the social order without taking into consideration human nature). *Note:* The author might consciously be trying to write such a book as the last suggests.

6. Verification.

   What books have you consulted to see if the author is telling the truth, or quoting correctly from others?

   What statements were challenging?

7. Style of Writing.

   Is the author clear? Is his writing for popular consumption, for the scholar, or for the professional class?

   Does the author show a love of his subject? What evidence have you of this?

   Is the subject-matter old?

   Does the book require too rich a background?

   Is the book bitter, good-natured, impatient, humorous, tolerant, sympathetic, or nakedly scientific?

   Is the author verbose, a maker of epigrams, a maker of quips, coarse, vulgar, pessimistic, or optimistic?

8. General Impression.

   What is your general impression of the book?

   What bearing has it on the course in social science that you are taking?

   Is the book well organized?

   Has it a plan of action, or purely critical, or just good reading?

   What arguments could you offer to boost those of the author?

   What could you offer in the way of reproof or rebuttal?

   What questions would you like to ask the author, if you were to meet him?

   What might the author well have omitted, or well added?

   Did the author provoke you to further study? If so, what books did you consult?

   Did you feel the author's earnestness throughout the work?

   Did you feel his personality?

   What books did you consult to get a deeper background of the subject-matter? Did you use the author's bibliography? Why?

   Name the books consulted, and tell how they aided you.

   Was there too much of the author in the book, and not enough of the subject under discussion?

   Would you suggest the reading of this book to your friends, your club, your teacher? Why?

   Did you agree with the author's title? If not, what title would you suggest?

   Would you like to add this book to your library? Why?

   Do you think the work lasting? Why?

9. Reviews.

   What professional reviews have you read of this book. (Consult the librarian to help you find some.)

   Do you agree with the professional reviewers? If you differ, state in what respect?

   Do you feel that you should reread the book, after reading the professional reviewers? What did

Scanned with CamScanner

you miss? Was it your fault or the fault of the author?

10. Exercises. (Particularly for the younger students.)

What would you enter in your diary after reading this book?

Prepare a ten-minute talk for a radio audience on the book.

Create an advertising layout for the book.

Create a blurb for the book.

Describe the pictures that you might make.

Make a library catalogue card for the book. Consult the librarian for help.

Write an imaginary letter to the author (in care of the publisher) of depreciation or appreciation.

Write one to the professional critics who have reviewed the book.

Suggest pictures, diagrams, or anecdotes.

Compare this book with a standard one in the field. Does it measure up? In what way?

See if you can dramatize the book in whole or in parts.

If you were going to publish your review and space had to be filled, would you fill it with a picture of the author? Why?

If not, what picture would you suggest to the publisher, keeping in mind the spirit of your review, the spirit of the times portrayed, and the spirit of the book?

11. General Directions.

Your report should be in the nature of a précis, or else one would rather read the whole book first-hand.

It should reflect your personality, your scholarship, your love of the subject, your expertness in the field.

You should note the space assignment which the author gives each sub-topic, and then follow suit in your review. (Don't mistake the trees for the forest.)

Everything that you quote from the author should be credited to the author by enclosing in quotation marks, and noting in footnotes or in the review proper the page or pages on which the quotation can be found. (Ask the librarian to show you how.) Likewise, if you criticize the statements of the author, be sure to tell where you got your facts, unless it is a general impression.

12. Examples to Study.

Study the book reviews in any good magazine.

Consult your English teacher for model ones in the field. Other examples can be found in the book sections of the better grade newspapers.

SYLVESTER FLYNN.
James Monroe High School.

Results of a Foot Survey at James Madison High School

Under the auspices of the Pedic Society of the State of New York, Kings Division, Herman J. Herzog, a registered Chiropodist-Podiatrist, conducted a foot survey of the male students of James Madison High School.

The boys examined were of the first and second year groups, ranging in age from thirteen to sixteen.

Orthopaedic and mycological (fungus) defects were principally sought for. Out of a total of about thirteen hundred boys, six hundred, or forty-six per cent, had some pedic disorder.

The most predominant foot disorder was weakfoot, which was manifested in twenty-five per cent of the group, the exact case record mounting up to three hundred and twenty-seven.

The term weakfoot is applied to a foot that looks like a healthy and normal foot when not bearing weight, but which, when weight is placed upon it, assumes an attitude of deformity wherein the arched structure of the foot, and principally its inner side, flattens to a greater or lesser extent. When relieved of weight, it again resumes its normal attitude.

There were comparatively few cases of actual flattened foot. Only fifty-two, or four and a half per cent, such cases were noted. This is explainable by the fact that accommodative changes in bones, ligaments and muscles have not occurred, due to the adolescense of the boys. The flattened foot is characterized by a functional impairment, a depressed or flattened inner side and by a more or less pronounced angulation of rear and forefoot, in which the latter points outward. The above pathological phenomena occurs with or without weight being exerted on foot.

Athlete's foot, a form of ringworm infection, was the next malady sought for. Only one hundred ninety-two, or fifteen per cent, were discovered to have had this condition. The figure was rather low, considering the fact that this disease is so prevalent and that there is a swimming pool on the premises, the natural habitat of the unattached fungi.

With the coöperation of the Boys Health Education Department, an orthopaedic and mycological clinic was formed. The mycology work in reference to athlete's foot consisted of the following:

A separate record of such cases was kept by the Chiropodist-Podiatrist in charge. Thus with the coöperation of the teachers in charge of swimming, boys afflicted were debarred from said activity until pronounced cured. A prescription for a salve, containing metallic iodine and essential oils, with an accompanying sheet of instructions as to hygiene, was insured to the boy with the admonition to apply course of treatment diligently for three weeks and then report back for a final examination.

The instructions given to the boy read as follows:

1. Wear white cotton socks, which should be changed daily.

2. After laundering them, dip into a solution of bicarbonate of soda (a tablespoonful in a small basin of water is sufficient) and then dry.

3. Prior to application of any medication, wash feet with Synol soap.

Scanned with CamScanner

4. Then place feet in a basin of water containing a few grains of potassium permanganate.

5. In drying the feet do not rub; blot the surface with a smooth towel (not a turkish towel). Dry the webs between the toes with absorbent cotton.

6. Saturate the shoes with a 10% solution of Formalin.

The results of this therapy were indeed gratifying. Practically all the cases have been cleared up with the exception of a few stubborn conditions.

The Orthopaedic Clinic concerned itself only with weakfoot cases. The following sheet of instructions was issued:

1. Stand pidgeon toed, rise on toes, then lower heels slowly. Do this ten times.

2. Stand with feet parallel, transfer the weight of the body toward the outer edge of the soles. Do this ten times.

3. Turn the toes in and walk forward ten steps on the outside of the feet, lifting the heels high. (Return ten steps.)

4. Sit on a table, feet hanging and apart; turn toes inward and flex foot.

5. Sit on a chair, feet on the floor and parallel, then turn toes in and curl toes under as if clenching a fist. Keep knees apart by holding both clenched fists between them.

6. Rub and knead the foot under the arch, pressing with the thumb and bending the toes down with the hands.

7. Inversion. — Flexion Exercise: Standing about 12 inches from the wall, fall towards it, keeping knees stiff, heels on the ground and arms outstretched. Repeat ten times.

Exercises Number 1 to 4 are to be done in the morning and 5 to 7 at night, in bare feet.

General Advice.

When walking always remember to toe in.

When you are fatigued, invert your feet whether standing or sitting.

Have your feet re-examined in three months by either a chiropodist-podiatrist or a physician.

No results can really be recorded at present, due to length of time involved in effecting a cure.

S. SCHINDLER,
Chairman of Health Education.
H. HERZOG,
Chiropodist-Podiatrist.
James Madison High School.

A Spanish Program in the School Assembly

The following program was presented by Mr. Pedro Caballero in the regular assembly period at the Thomas Jefferson High School on January 11, 1933.

1. "El Prólogo," Eli Kramer, master of ceremonies.
2. "Caixa Guitarra," danza con crótalos. By "La Monterito."
3. "Amapola." By Srta. Perla Violeta Amado, soprano guatemalteca. Sra. Cordellat at the piano.
4. "Ojos Verdes," a Cuban song. By Frank Pepitone, tenor, accompanied by Miss Bertha Mathers of the Spanish Club "Españita."
5. "La Jota," Spain's national dance. By "La Monterito."
6. "Capullito de Alelí," Puerto Rican song. By Srta. Perla Violeta Amado.
7. Medley of Spanish songs (harmonica). By Martin Cohen.
8. "La Violetera," Spanish song. By Srta. Perla Violeta Amado.
9. "Rapsodia valenciana," Spanish dance. By "La Monterito."
10. "Júrame," Spanish song. By Srta. Perla Violeta Amado.
11. "Poema corto," recited by Martin Cohen.
12. "Bulerías," Andalusian dance, by "La Monterito." Sra. María Cordellat at the piano.

Material Used: A Spanish shawl and Puerto Rican vase for the piano. Screens decorated with Spanish posters. Puerto Rican and Spanish fans; natural flowers.

Ventilation of the Classroom

From the Health Council of the John Adams High School

With a little thought and very little work it is possible for each teacher to control the conditions in the classroom so as to insure comfort. The following instruction will enable you to do so:

Open two or three windows from the top. The entering fresh air will descend, flow through the openings provided at the bottom of the students' lockers, and up through the louvres on the roof.

The amount of window opening depends upon the weather conditions outside. If the weather is too severe for opening of windows, operate the ventilating unit by raising the window even with the top of the ventilating unit and pressing the black push button on the starting box at the side of the unit; to stop, push red push button. Do not operate ventilating unit and open windows at the same time, as this is a tremendous waste of labor and fuel and no one receives any benefit.

The ventilating unit is designed for about twelve changes per hour, so that the air in the classroom is entirely changed every five minutes. Do not have the ventilating unit shut down and all windows closed at the same time, as the air will get foul and there will be very disagreeable odors from clothing, etc.

If you think the room is cool and you find the radiator cold, continue to leave the windows open and you will get steam in the radiator much sooner; remember that each student is responsible for about 180 heat units per hour and this is sufficient heat to keep the thermostat from admitting steam to the radiator for long periods of time.

Scanned with CamScanner

Do not be governed by your feelings; your feelings vary, and there is no greater benefit to health than a uniform temperature. You will suffer less from common colds.

Be guided by the thermometer and if the temperature is not correct notify the engineers' staff and they will be glad to see that it is taken care of. The thermostat will keep your room temperature within two or three degrees at all times.

Please stop the ventilating unit if there is any unusual noise and notify the boiler room.

E. HOAG,
Custodian Engineer.

John Adams High School.

Timeless Odysseus

Much has happened in the last three thousand years to make the world different from what it was in the days of Homer. Not only have manners and customs changed, morals and tastes altered, but even the topography of the earth has undergone a metamorphosis. Science has to a large degree supplanted superstition, the gods have dwindled to one, and the younger generation reads "Nick Carter" instead of Plutarch's "Lives." Into the dark (and apparently bottomless) abyss of Time have gone not only the earthly inhabitants of the past three thousand years but (with rare exceptions) their literature, as well. Few scrolls enjoyed a life longer than that of their authors and even fewer have survived to this day. Most of the literary relics of this distinct age live today only in the sense that they can be read, if anyone wants to do so. Many of them are thumbed only by venerable scholars because in the march of centuries they have lost whatever they may have had of universal appeal. Very few indeed, still have the power to hold the devotees of "Nick Carter," but most alluring of all these enduring works stand, I think, the epics of Homer.

Wherein lies the power of "The Iliad" or "The Odyssey" to interest the contemporaries of Capone, who gape in awe at Little Caesar and shudder deliciously when Scarface is put "on the spot"? What makes high school students who yawn their way through Plutarch's "Lives" read "The Odyssey" with the same avidity that they do "The Border Legion"?

"The Iliad" may be a greater poem, but as a story it is in my opinion far inferior to "The Odyssey." Its canvas is too large and the fortunes of no one person are particularly dealt with. As on the crowded stage of a Dickens novel, we are interested in Achilles, in Hector, in Priam and in Patroclus, but our interest is not a *personal* one. There is no Frank Merriwell to idolize in "The Iliad," but in "The Odyssey" the modern boy or girl has not only a Frank Merriwell to worship, but a more adorable prototype, more fascinating because he is more real, more human than the invincible Merriwell. Since, therefore, whether rightly or wrongly, Homer is popular with high school students because of "The Odyssey," I shall limit my discussion to that epic.

Boys and girls approach the study of "The Odyssey" with unfavorable prejudices. The mere fact that it was written so unbelievably long ago, that the author, most suspiciously, has but one name and that the names of the characters are quite unpronounceable, are enough to create an attitude of wariness and of preconceived dislike.

The teacher's first task is to sweep away these preposterous and yet understandable prejudices. Mere words and arguments cannot accomplish this so well as sheer enthusiasm. The students must be led to see that underneath its suspicious exterior is a rare adventure story, as thrilling, at least, as any of the Tom Swift stories or the Campfire Girls series. A short, modernized synopsis of the plot plus the teacher's genuine enthusiasm are in most cases sufficient to give "The Odyssey" a fair hearing—and that is enough to make it plain to boys and girls that it is, at least, a marvellous tale.

For it is a thrilling story. What modern thriller is as chock-full of breath-taking moments? Sax Rohmer's tales of adventure are as tame as bedtime stories compared with Odysseus' mix-up with Polyphemus or his escape from the Sirens. There are more to-be-continued-next-week moments in this story than in all the Tarzan books, with the Nick Carter series thrown in for good measure. Odysseus tearing his men away from the Land of the Lotus Eaters, freeing them from the spell of the cruel Circe, saving them from the clutches of the Sirens, sacrificing some of them to the monster Scylla, that he might save the rest—what nerve-wracking moments of excitement are these!

As our movie producers well know, the highly developed taste in the youth of the nation for thrills calls for honor and murder. "The Odyssey" supplies these in generous measure. First, the men of the hero are murdered in most cruel fashion, their brains dashed out by a terrible giant or their bodies torn limb from limb by a many-armed monster. Later, it is the hero himself who murders mercilessly (and with our fullest approval, this time the impudent suitors who beleaguer his home and woo his wife.

What is an adventure story without a hero and a villain? Not much, reply the movie-hardened youth of America. "The Odyssey" is true to form. The hero Odysseus is pursued and persecuted by the villain Poseidon, who places all sorts of obstacles in his path. Like a true hero, Odysseus conquers them all and finally reaches his goal—his home and family.

What producer would not accept a movie with the following plot: Mr. X. goes to war. He achieves great prominence on the field of battle. The war over, he turns his steps homeward. But on the way home, he makes a deadly enemy as a result of injuring the son of a wealthy and powerful man, Dr. Y. Dr. Y, for revenge, hinders X's return. Trains are derailed, ships sunk, aeroplanes tampered with, coffee drugged, women decoys used, thugs employed—but all in vain, for Mr. X fights his way through all these

Scanned with CamScanner

stupendous difficulties and at last reaches his home, only to find himself confronted with a situation, as difficult, at least, as any that faced him on his checkered journey homeward. All the young blades of the town have moved into his palatial home, eating, drinking, roistering, wooing his wife and intimidating his son! A fine situation for any one man to handle! But Mr. X does. He hides his identity, comes into his house in the guise of a beggar, is kicked and insulted, and then at the proper moment—strikes. Like chaff he drives the frightened revellers before him and destroys them all. The final fade-out finds him reunited with his faithful wife and son.

A movie such as this, faithfully paralleling as it does the story of "The Odyssey," would be a sure-fire hit, especially if it were given an intriguing title such as "Two Kinds of Women," "Experience Unnecessary" or any one of a thousand other titles which experienced scenario writers could easily supply. It is clear from this modernized version of "The Odyssey" that though it was written three thousand years ago and though the names of the characters are long and difficult, yet the story abounds in real up-to-the-minute situations.

While "The Odyssey" is the equal, at least, of any paper-backed novel for thrills, it is superior to all of these stories which our boys and girls delight in, from the point of view of technique. Homer not only gave us a good story, but he knew as well how to tell it.

Starting in epic fashion in the middle of the action, and then cleverly telling us, in the words of Odysseus as he relates his adventures to Alcinous and his court, what came before, Homer establishes himself as a consummate artist. With deft touches here and there, we get glimpses even into the boyhood of Odysseus until we have a full picture of the man. The incident of the boar hunt when Odysseus, as a boy accompanying his father, received the wound the scar of which enabled Eurycleia to recognize her master, is told in vivid colors and serves to enrich our picture of the man Odysseus.

Very skillfully does Homer cause his readers to dislike more and more those arrogant wooers and finally dislike turns almost to such hatred that the indignant reader calmly acquiesces in the cold-blooded, wholesale slaughter of the flower of the youth of Ithaca.

And with what inimitable artistry does Homer lead up to his tremendous climax! There is electric tension in the air as Odysseus calmly prepares himself for the big moment. Patiently he suffers the insults and abuses of the doomed men. How we writhe when Melanthius kicks him or when Antinous throws a stool at him or when Ctessipus hurls a hoof at him! We can hardly wait for the moment of retribution. But Homer does not make the mistake of hurrying. Mercilessly the coil of death closes around the suitors until, in our excitement, we can almost no longer contain ourselves in our impatience for Odysseus to strike. And when the great instant finally comes, when Odysseus, his loins girded, springs to the threshold, with the mighty bow beside him, that only he can wield, we are tingling with excitement. The climactic moment surpasses our expectations. (In how many stories does the climax fail to disappoint us?) Then, after just retribution has been visited upon the suitors and Odysseus extricates himself from the difficulty which must inevitably ensue from such wholesale murder, Homer ends his tale by assuring us that our hero "lived happily ever after."

"The Odyssey" is a greater story than "Tarzan of the Apes" or "Tom Swift," not only because of its greater characterization. As a matter of fact, in the Tarzan or Tom Swift or Nick Carter or Frank Merriwell or in any other kindred series, there are no real characters. It is easy, by a *reductio ad absurdem* to bring students to a realization of this. A comparison of these novels brings out their fundamental sameness and a comparison between Frank Merriwell, for instance, and a human being, is sufficient to elicit a sheepish admission of the realization that the former is not a real human being.

A comparison between Odysseus and Merriwell yields to the fact (often somewhat startling to Merriwell fans) that the latter is *too* great, *too* infallible, to be either real or interesting. No human is perfect, and it is because of the imperfections of Odysseus, mingled as they are with his greatness, that we love him. Merriwell is brave, but he is never rash. Odysseus is brave, but how rash he shows himself to be when, well out of the clutches of the blinded Polyphemus, he cannot resist the temptation to taunt him and to tell him his real name. It almost costs him his life and the lives of all his men.

How many real people never tell lies? Merriwell never does and yet Odysseus, godlike though he was in his greatness, stooped to fabrication when he met Athene upon his return to Ithaca (and she didn't mind at all!); he lied to his faithful servant Eumaeus, too. When I asked my students how many of them liked Odysseus less because they now knew him to be a liar, not one but said that he liked him even more because he showed kinship to them!

The one and only pitcher of double shoots though he was, captain of all teams and hero of all sports, admired of all men and beloved of all women, never for an instant, even, did Frank Merriwell show conceit, even in the slightest degree. Not so Odysseus. He was great and, strange to say, he knew it. In telling his story to the Phaeacians, he says that he is Odysseus, "for cunning plans of every kind known among men; and even to heaven has spread my fame." On another occasion he calls himself "Odysseus, taker of Troy." Such human weakness! Yet, how much more understandable and lovable than the super-human perfection of a Merriwell!

While Odysseus throughout showed himself to be commendably faithful to his wife and refused to be beguiled by

Scanned with CamScanner

the nymph Calypso, yet he showed himself to be only a man, beneath all the heroics, when he forgot his steadfast purpose in the company of Circe and while away a whole year with her in feasting and merry-making, until finally his men had to admonish him and bring him back to himself. How real! In short, students can readily be lead to see that while such characters as Merriwell or Tarzan are mere puppets made of card-board and not of human stuff, Odysseus is a real man, with weaknesses like ours, a man who mourns over his dog as readily as he murders to avenge his wrongs.

Nausicaa, too, is a living character, far different from the ladies of high morality who trip daintily through the pages of Bertha M. Clay. As any normal girl would be, she is attracted to the manly Odysseus and immediately sees in him a possible mate for herself. And how charmingly modern is she when she asks the "taker of Troy" not to accompany but to follow her into town, so that tongues might not have occasion to wag! Her parents, regal though they are, in true twentieth century style, offer Odysseus a goodly sum and a life of ease if he will but marry their daughter.

Penelope, pathetically faithful to her husband for twenty years, Telemachus, who becomes suddenly bold when his father is by his side, Eumaeus, the faithful servant who "has been in the family for years," the suitors, whose methods smack strongly of modern racketeering, all vibrantly human, provide for real situations.

And that brings me back to my opening question, "Why do boys and girls enjoy reading a tale that was written three thousand years ago"? The answer has, I believe, been indicated, in a general way, at least. "The Odyssey" is popular because it is not only a story of high adventure, skillfully told, but because it deals with *real* people in human relationships and unless human nature changes more radically than it has since the days of Homer, unless people cease to be interested in themselves and in their fellow beings, "The Odyssey" will be read and enjoyed thousands of years hence by boys and girls who have never even heard of the thousandth successor to Frank Merriwell.

JESSE GRUMETTE.
Abraham Lincoln High School.

Ashes to Ashes

"Ashes to ashes and dust to dust" becomes a most happily chosen utterance when we seek to entomb our highly reputable literary classics. In our well-intended, but misguided preparations in literary appreciation, we proceed to a scientific dissection of erstwhile works of art. Nothing lends itself so well to this process as a cadaver, so we zealously proceed to legalized murder of fine books. Now there is something about a corpse that always commands a dubious respect, but even the most sanguine cannot lay claim to its ability to create spontaneous enthusiasm.

Today, we are convinced, for the most part, that our reading texts should not be belabored. However, we continue so painstakingly to secure exhaustive detailed study. We seek to ritualize and thus to devitalize. Our lesson plans list questions which probe into every action, every scene, every mannerism, even every article of dress. After laying everything so cruelly bare, we attempt to build up appreciation only to find that life has ebbed, and we are contemplating a gruesome, dead thing.

These methods are without real value, and their constant over-use has conducted literature into the realm of pure science, and there it does not belong. In this hypercritical age of ours, do we no longer read the classics for enjoyment? Are we so steeped in our readings about books that we no longer read the books themselves? Where has the author's personality gone, his creative imagination, his flights of fancy, his bursts of song, his groans of despair? Truly the voice of the author cries now in an intellectual wilderness. We are now scientific in our treatment, but science is cold, and life is warm.

Speaking anent scientific investigation in the realm of literature, Professor Cazamian of the University of Paris says, "It is not possible to gather all the materials out of which a work of literature has grown; and if we could have them all in our hand, they would be only dry bones; the spirit that breathed upon them is everything."

What to do: First, stop being dogmatic in the classroom, declaring something beautiful before it has proved itself beautiful. Second, stop the frantic search for factual detail, and use much more of the discussional type of lesson. Third, let the student read the book completely before genuine study is started. Fourth, let the student weigh the merits of a book in his own scales first—then later help toward a truer weighing. Fifth, make the author an integral part of the work itself. Sixth and last, let the teacher read these books first as a person, then as a pedagogue.

May I briefly develop these six points? So very often does the teacher in the classroom cling to traditional values and worship names in literature. So imbued is the teacher with the feeling that the classics are sacred that he sometimes feels that unflavored, impartial, cold criticism smacks of sacrilege. He claims that enthusiasm on the part of the instructor kindles a like response in the student. I think here, too, that blind faith of this kind places too much reliance on a doubtful motivation. Great expectations are developed, and generally great disappointments succeed in their stead. To label works with terms emanating from pedagogical dogma is to create mistrust. A mistake of this kind requires untold zeal and skill in the correction.

I think it presumptuous on the part of the teacher to demand knowledge of factual detail which he, himself, has long since blissfully scrapped. There are other methods for checks on the reading. As we all remember the larger aspects of fine books—plot, setting, character development, and the like, so will the students, in later years. Topical discussion is invalu-

Scanned with CamScanner

able in arriving at a clearer understanding of the book and in building up standards of conduct.

It goes without saying that studying a work piecemeal and at a snail's pace is destructive of appreciation. Yet, very often do we read isolated chapters or sections at a time. A youngster likes to read through if he is to read it at all. This unifies the work, gives him a perspective of the whole work, and makes him see a real proportion between parts. Complete reading in addition allows for really fruitful topical discussion.

The student has an innate faculty for criticism. He thinks he knows what he likes and what he doesn't like. He should be allowed to form his own opinion of the work. This is a satisfaction to him as it is also to have some of his opinions corroborated by the teacher. Then if additions or revisions are to be made, they are received with good grace, and the matter of criticism becomes really mutual.

We are all agreed that some knowledge of the author is necessary in any study of literature. However, this usually consists in dealing with the cut and dried facts found in reference books, appendices and footnotes. The author should be presented as a creature of flesh and blood. He should be given all of his human qualities. Study of the whole range of his emotions as a person and of the happy and unhappy circumstances in his life is well worth the effort. All of this infuses the book with the fire and dash expected of an interesting literary genius.

In conclusion, the position of the teacher assumes new and greater importance when we consider that the situation calls for definitely human treatment. The teacher should, for the time of first reading, become merely a trained, interested individual reading a book of established merit. From the reactions obtained from this reading for entertainment, the pedagogue may find the proper methods for skillful, animated, artistic, profitable, classroom treatment.

There have been definite signs of real resurrection, but there still remain many tombs from which the doors may happily be rolled away.

Gestalt and Geometry

The Gestalt psychology of configuration, closures and background when applied to learning, shows why certain subjects in school give trouble to beginners. In geometry, for example, many students, some of whom later excel in the subject, have considerable difficulty in making anything out of it at first. It is generally assumed that the concepts of congruence, equivalence of parts, transposition, and the like, will be understandable from general experience and logically satisfying from the axioms.

The propositions are in themselves nicely chained and altogether satisfactory from the stimulus response psychology standpoint. The hypothesis (stimulus) begins the chain, association patterns based on past propositions exercises, and so on, form the link, the series ends with the culminating final link, the conclusion (response). The beginner admits it sounds true enough, but can't see what it is all about. He can see nothing wrong, but also can't see the point. The ability to think logically has nothing to do with it since many troubled beginners later become excellent mathematics students. Bertrand Russell himself says that he had some trouble with the subject at first. The propositions and things are isolated odd bits of mumbo-jumbo logic to a beginner. It doesn't belong anywhere. It is like the illustration of Kohler who asks one to think of the sensation of a prick of the arm without the "ground" of the arm. It can't be done. Until there is a fair concept of the subject background, it is difficult to see meaning within it, even when logically linked. After a while, when enough is learned, by rote usually, to get some kind of a first book "configuration," students "catch on."

They begin to see what it is about, not because of more knowledge, but because of more meaning. Applied to the subject, it means that it is necessary to teach some geometry before it is possible to teach propositions. If pupils can get some sort of a bird's-eye view of the whole subject, the manner in which it is organized and justified and the relations with which it deals, before any demand is made to master strictly logical sequences of geometric or arithmetic links, a great deal of difficulty that beginners have might be avoided. And it is doubtful if this can be done in a rapid period or two.

Outlines serve an immensely useful purpose in giving the bird's-eye view, the "closure" before the scene is examined at close range. A part is then part of a configuration. The logic of the thing is a function of the closer view. It is perhaps because of this fact that mathematics is not given a preliminary overview for the purpose of orientation. It is well known, of course, that arithmetic and algebra do not entirely furnish this "ground" for geometry.

In having this ground, closure and configuration, the teacher has an advantage over the pupil that is something more than mere knowledge of the subject matter. It explains why a good teacher is one who teaches around a subject and why there is no better way to learn a subject than to teach it.

(UNSIGNED)

Suggestions for Lesson Planning in First Year Stenography

The teachers of the Department of Secretarial Subjects at the Bushwick High School find the following outline helpful in preparing their daily lesson plan for first year stenography. No effort is made to include in each day's plan all the topics contained here. We have found, however, that they bring to mind the most significant and pertinent items necessary for a satisfactory lesson period. This plan is a result of two individual lesson plans presented in a departmental

Scanned with CamScanner

meeting for examination, discussion, and revision. The plans are here consolidated as a unit report.

I. Assignment of Homework for the Next Day (placed on board before class enters the room, if possible).

A. Purpose
1. Drill
2. Review
3. To determine strength of pupil in attacking new problems; testing before teaching

B. Content

1. Specific
a. Word drill
b. Phrase drill
c. Transcription from longhand to shorthand
d. Transcription from shorthand to longhand
e. Transcription of unit of work which had been dictated the previous day
f. Reading practice from plates
g. Comprhension of rules

2. General
a. Meanings of words
b. Meanings of business phrases, abbreviations, etc.
c. Understanding of business situations involved

C. Form—generally, to be given in four parts: (1) Manual, review of a previous lesson; (2) Manual, work on present lesson; (3) Speed Studies, review of a previous lesson; (4) Speed Studies, work on present lesson

D. Adaptation—add to the assignment at any time during the period, in terms of class or individual weaknesses revealed during the period

II. Consideration of Homework for the Present Day

A. Mechanical checking to see if lesson has been prepared in accordance with instructions

B. Testing for thoroughness of preparation, by

1. Board work
a. Form, slope and proportion of writing
b. Correct application of theory
c. Fluency and speed of writing and reading
d. Correctness of spelling, punctuation, etc.

2. Reading from homework papers
a. Quickly, without self-correction
b. Halting reading is unprepared reading
c. Understanding of individual words and general content

3. Questioning—for comprehension of theory rules

meaning of words, general content, etc.

C. Rating—on one basis only—ten or zero—self-correction, not permitted, in order to stimulate fluent, steady, eraserless transcription

III. Presentation of New Matter

A. Preparation, or motivation, through

1. Method
a. Relation to material already learned with emphasis upon significant items
b. Purpose of new material
c. Focusing attention upon material to be learned, excluding all extraneous attractions

2. Material (related to new matter)
a. Short ten-word test, examined and corrected in class
b. Sentences or letters, at seats or at boards
c. Rapid review of rules

B. Presentation

1. Method
a. Types
(1) Inductive — from words to principles
(2) Deductive — from principles to words
(3) Inductive — Deductive—generally used
b. Purpose — most economically to effect sufficient understanding of new principles to permit of their being applied readily to new words and phrases
c. Criteria
(1) Minimum, teacher activity; maximum, pupil activity
(2) Minimum, talking; maximum, writing and reading
(3) Minimum, faulty habituation; maximum, positive adaptations
(4) Minimum, discussion; maximum, drill and dictation

2. Material
a. Words, sentences, and connected matter
b. Theory review and analysis

IV. Drill

A. Focalize attention on details of thing to be drilled

B. Rapid repetition in attention

C. Examination and comparison with model (teacher's outlines on blackboard)

D. Continued repetition with attention concentrated on detail to be improved (individual differences)

E. Examination — comparison — repetition, ad infinitum

Scanned with CamScanner

V. Dictation (Every Period)

A. Material—familiar and unfamiliar

B. Form—words, sentences, letters, and articles

C. Duration—at least half the period

D. Purpose—to habituate rapid response; to instil confidence in the practical use of shorthand; to promote fluency of writing and thinking in shorthand; to provide material for transcription

E. Method—generally, rapid dictation of familiar matter should precede slower dictation of unfamiliar matter; provision should be made for individual differences; frequently, prolonged dictations should be introduced; read or transcribe everything dictated.

ANNA H. INTEMANN.
Bushwick High School.

A Blank for the Delinquent

If we want to be dogmatic, we can say that there are two kinds of schools; those that have a multiplicity of forms and those that have an insufficiency. Regardless of classification, though, no departmentalized school should lack at least one form—a follow-up blank for students.

In schools where students follow individual programs, as in our high schools and in many of our junior high schools, each pupil meets, at times, as many as seven different teachers in one day. Report cards may be given out three, four, or five times a term, but three times seems to be the usual number—preliminary report, mid-term mark, and final estimate. Five different people, depending on the organization of the school, may be interested in the attendance, scholarship, and discipline of the student. These are the teacher in charge of attendance, the school disciplinarian, the grade adviser, the official teacher (the one who meets a section usually before and after attendance in the day's subject classes), and the subject teacher.

Students are generally called to the attention of these school officials because of delinquency in one or more of the following respects: conduct, attendance, and scholarship. What knowledge have these teachers of the quality of work, conduct, and attendance of these students during the interim that report cards are issued? Most of the report cards issued in high school have no provision for a statement of conduct. How can these people learn, when the necessity arises, for this information, to what extent self-control is exercised by certain students in all their subject classes? Failing marks and exceptionally high ratings do not show what caused the teachers to make the evaluations they did. What means have these people for discovering the causative factors for these marks? One teacher makes a complaint to the disciplinarian regarding the conduct of a student. How can this student's conduct in other classes be recorded? The grade adviser wishes to have a daily or weekly check-up on a student's scholarship. How can he accomplish this? The officer in charge of attendance knows of the delinquent tendencies in a student. How can he keep a constant watch over this student with some form of a moral club? These questions and many others can be answered thus, "Use a form which may be called a *Special Report*, a follow-up blank for students."

The Special Report used at Haaren High School is mimeographed on a sheet of white drawing paper, 5 inches wide and 9 inches long. This size was purposely chosen since the report occupies a space 3 inches by 5 inches when folded into three equal parts—the same size as an index card. The following is a description of one side of the report, read while it is held in a vertical position.

On the first line is room for the student's name and class. Below this, in half-inch letters, are the words *Special Report*. The next two lines contain the words, "for the period": followed by a space for the appropriate entry, e.g., "beginning of term to 10/25/32," "week ending 11/18/32," or "today, 11/30/32." The next two lines are occupied by these words in capital letters, "Carefully Read the Following and Consider All Appropriate Entries on the Reverse Side." Then there follow three paragraphs of typewritten material.

"*Student*: Your job is (1) to ask me for this report, as we agreed; (2) to have all the blanks on the reverse side filled in by every teacher you meet today; (3) to take home this report, if required, and (4) to rturn it to me. If your parent's signature is *not* required, place this completed report on my desk at the end of the last period today. If your parent's signature *is* required, place this report on my desk before the silent period tomorrow.

"*Teachers*: Please make the proper entries on the reverse of this special report. For general estimates use only: *Excellent, Good, Fair, Poor*. Use the utmost care in making an evaluation. Do not be influenced by any ratings you see written by other teachers. Do not be influenced by any ratings made by you on similar reports for this student in the past, even if they go to extremes; e.g., *Poor* on one report; *Good* on the next. If you use the terms Excellent or Poor, write a brief explanation of your ratings.

"*Parents*: Do not hesitate to write, telephone, or visit us if you have any questions to ask, or if you do not understand this report, or if your son tells you a different story from what you read on the reverse. We want to make your son a good and self-supporting citizen, but we cannot do it alone. *Please Coöperate With Us.*"

Then there follows a space for the signature of the person asking for the special report, the words "Industrial Division of Haaren High School, 59th Street and Tenth Avenue, New York City," and space for "Parent! Please sign here."

Scanned with CamScanner

The other side of the special report is read while it is held in a horizontal position. There are six vertical columns labelled, respectively, 1. Subject, 2. Work (see other side), 3. Conduct (see other side), 4. How many days absent? 5. How often do you assign homework? and 6. Signature (in full). There are seven horizontal columns with the following entered in the first column, in this order: English, mathematics, science, mechanical drawing, leaving three blank spaces for the entry of the names of other subjects that the student takes.

The Abraham Lincoln High School Club Exhibit

Parents often wonder what their children do in the hours they remain in school after the official program is over. Are these hours well spent? It was with this question in mind that the Administration of the school and the Club Council decided to run a Club Exhibit.

Plans for this display were a long time in maturing. The Club Council, which consists of the Presidents of the various clubs, and which meets bimonthly, were advised the preceding term as to what was expected of them. Addresses in regard to their exhibit were made by the Administrative Assistant of the school and the Chairman of the Art Department, in addition to reports by the Presidents themselves on what their clubs were doing. Thus was the Exhibit advertised and prepared for.

Under the supervision of the Chairman of the Art Department and the shop teacher, the arrangements for the Exhibit in the library were made. More than forty booths were laid out on tables, each booth about four feet in width, and with a back support of plywood for any labels that might be necessary. An artistic design welcoming the parents, for the Exhibit was held in Parents' Week, decorated the entrance to the Library, and large, wooden letters were placed on a slope of the school's large campus, also welcoming visitors.

The clubs held their displays during the whole Parents' Week, and on Thursday night of that week many hundreds of parents visited the school and were directed to the various points of interest by faculty members.

Practically every type of activity was demonstrated at the Exhibit. The various art squads displayed the performances of their students. One of the most interesting exhibitions was that of the Art Weaving Department, featuring fine knitted lace and woven rugs prepared by the students themselves.

The Science Clubs attracted a great deal of attention with the Radio Club, featuring its own sending and receiving set, and the Aviation Club, showing many models prepared by the students. One of the finest displays was that of the Medical Club, which offered dissections of various animals prepared by students under Faculty supervision.

The language clubs, of which the school has many, exhibited costumes and homes of various countries, and were aided considerably by the Costume Club.

The various literary societies were led by the Poetry Club which, besides exhibiting poems written by students, had a very clever project on the Evolution of a poet, showing progress from random scrawls in a classroom to the finished product in the school publication, *Cargoes*. The Short Story and Journalism clubs also displayed students' work in an attractive manner.

Perhaps the outstanding feature of the exhibit was the artistic arrangement of the whole; as the visitor proceeded from booth to booth, something new helped arouse his interest. The primary purpose, which was to display the fruits of the students' extra-curricular labor, was accomplished to the full.

BERTRAND BURGER.

Abraham Lincoln High School.

The Mind — Its Health Habits

Since personality is undoubtedly affected by unhappiness, as we all know from our own experience, perhaps our first step toward producing a wholesome personality might be to attempt to discover just what problems are causing undesirable conduct manifestations and unpleasant personality traits.

These, though serious in themselves, are not nearly so serious as the things that are causing them to appear as symptoms. We cannot emphasize too much the importance of "cause." If we are really to bring about health habits of mind, we must find what underlies such symptoms as inattention, aggressiveness, failure, rudeness, and the numerous other unfavorable elements that come to our notice.

If we are to believe psychiatrists, a large portion of all human behavior leading to inefficiency and unhappiness might be prevented if knowledge we had at hand were utilized.

By way of getting at the problem which faces all us, and presenting proof of its crying need (though most of you, as understanding teachers, need no proof), another teacher and I asked our students to write, anonymously, of the things that worried them. This was purely voluntary—anyone who felt she could not, was not forced to write.

The tabulation of about 280 papers showed that the largest proportion was concerned with worries about home—mother, family quarrels, getting along with big sister, and so forth. School worries were next in importance. I might add here that if we only know how our casual or intentional glances were interpreted, or the actual seriousness with which we were taken at practically all moments, we might try to be better actors or actresses. The usual adolescent worries about the future, other people's opinions, clothes, boys, appearance, and loneliness told their own story.

One girl told a most pathetic story of loneliness. She had never had any friends of her own age. Then, one night, a girl whom she knew merely as a classmate called for her, and took her to meet some young people "on

Scanned with CamScanner

another block." These trips to Paradise lasted several weeks. Then the classmate stopped calling. The girl wrote, "All day long I think and I lie awake all night, wondering why."

I have selected three of the most typical. The first is full of the woe of home conditions—father out of work, rent to be paid, and the like, with the consequent effect of these conditions upon the girl's school life. The second tells of a girl who, in her own language, is "always a third on a twosome." Her letter, though amusing, is none the less evidence of what is, to her, a real tragedy. The third is the plaint of a girl who hates her mother and can't wait to get out of her home. Her hatred of her mother is based upon the latter's "constant harping on the fact that I am ugly and my sister is pretty."

What can we, as teachers, do about situations like these? We all know that there is no one solution of life's problems, for we can not standardize the human element. The first thing we can do, however, is to be alert and aware of those symptoms whose cause might be revealed to us. Then, too, we might attempt to offer them a perspective on life, to show that the right attitude toward living is an evidence of a maturing personality. Thus we enable her to meet her obligations efficiently and handle her freedom wisely.

The November, 1932, issue of *Understanding the Child* contains some very workable mental hygiene precepts which might help the girl to establish a working philosophy of life that will keep her from surrendering or evading.

LILLIAN M. SILVERMAN.
Julia Richman High School.

The Efforts of a Junior High School Teacher of Latin

Inasmuch as our Junior High School children can elect only one language, it is our task to encourage the election of Latin. In the 7B and RA groups, the children are given an opportunity to elect either Latin, French, German, Spanish or whatever language is offered. Last year there were 60 Junior High Schools offering French, 21 Latin, 19 German, 14 Spanish, and 7 Italian. French was offered in every school except two in Manhattan, namely P. S. 30 and P. S. 139. Thus every child was afforded an opportunity of electing French. In only 21 schools, or about one-third of the Junior High Schools, was Latin offered and then only to General Students; Commercials are discouraged from taking it. Now the question is how to encourage its growth, and this I shall discuss first in our school and then in the schools throughout the city.

In our school, which is P. S. 171, or Lincoln Junior High School, Brooklyn, we started campaigning for new Latin students early in October as the option cars must be filed by November 15 and a choice of language made. We decided that it would be a good idea to enlist the students in a new member campaign and my RC group pledged itself to enroll new students. They prepared a program which they presented at the RA and 7B Assemblies. This program included a Latin play, a Roman School, selections, a poster parade, songs, and lastly, original speeches by the students on the values they had received from the study of Latin. Their program was quite a success and they were invited to repeat it at the Parents-Teachers' Meeting and also at the Open-School Week Assembly. In this way the parents were shown the possibilities of the language and the results were that at the present time it seems as though we shall gain an additional section in beginners' Latin. In addition to our program we displayed charts and posters and other realia which the students made in the Latin Club. I use charts as suggested by Miss Florence Sabin and the Classical Bureau of New York University, where a wealth of material may be found. Incidentally, I believe this is the first time that there has been any attempt to "push" Latin in our school.

Another valuable assistance in furthering the growth of Latin is through the school officials. Dr. Davison, our principal, formerly taught Classics here in the city schools and he encourages the work of our department in every way. His kindness and cooperation have been a great inspiration. Mrs. Thomas, the Assistant-Principal, has also been very helpful in promoting Latin. She is deeply interested in the subject and the best evidence is the fact that her two sons are studying Latin. Her work consists of making our students' programs and her advice is often sought by the parents and pupils. She has turned some doubtful students from French to Latin. If Latin is to survive we need the aid and encouragement of the school executives. It is the duty of every teacher to sell his subject to his supervisors, especially the Latin instructor in these days when French is the favored language.

In 1932 the numbers taking language work in the New York City schools were as follows:

In the Senior High School there were

65,707 French
37,092 Spanish
18,262 German
22,782 Latin
3,163 Italian
267 Hebrew
137 Greek.

Of all languages, 124,224 were studying Modern Languages and 23,181 Ancient Languages. According to some figures recently published there are now 107,000 French students, 41,000 Spanish and Latin was not mentioned.

In the Junior High Schools the numbers were as follows:

38,384 French
4,613 Spanish
4,010 German
2,881 Latin
2,550 Italian.

There were three times as many taking French as all other languages combined.

Now what is the reason for Latin being at the bottom of the ladder and how can we raise it? Other cities like Baltimore and Los Angeles are in-

Scanned with CamScanner

creasing the numbers. Why is the number of those studying Latin in our schools decreasing? There are various reasons and I shall touch on a few.

One thing which does not encourage the study of Latin is the lack of articulation between the Senior and Junior High School teachers. The Senior High School teachers receive the material which we have sorted over for them. We take pupils with I. Q.'s from 60 up; we sort them over and pick out the "language-dumb," work to get the remainder through a City-wide test with 100% passing and then hand them over to the Senior High teachers. We have done our work and it is up to them to finish it. They should not criticize Junior High School children and inform them that they don't know anything as they came from the Junior High School. Charitable tolerance of the Junior High School is not enugh. There must be harmony and coöperation. We are fortunate in having the John Adams High School in our district and a Latin Department under the direction of Mr. Mann, where Junior High School children are welcomed into Latin 3 and continue the work from the point where we leave off in Latin 2. Recently I received a letter in which he said, "What we expect of Junior High School pupils in Latin 3 is no more than we expect of our own people, namely, that the third termers take up the work and base it on their previous knowledge." He sent me some of the ratings of our former pupils and suggested we send a million more like them. This letter did more to promote harmony and create a friendly feeling throughout the school than anything else could do.

The other extreme is represented by the remarks broadcast by a parent to the effect that children were wasting time studying languages in Junior High Schools as they could not receive adequate instruction. Her source of information was a neighboring high school Principal. These were the same type of remarks made at the Junior High School Conference last Spring by one or two speakers. Remarks of this type do not promote the growth of Latin or of any other subject.

We Junior High School teachers realize that the failure list is sometimes large in Latin 3 and 4 in the Senior High. This naturally reflects back on the Junior High School and disgusts the Principal with the subject. I have heard more than one Junior High School Principal say that he does not want Latin in his building as students do so poorly in the Senior High School. We can all promote the growth of Latin by reducing our failure list. This is true, too, of other languages.

It seems to me that one of the best ways to encourage the study of Latin in the Junior High School would be to have a course in Latin filled with activities, a course in which the pupils could try out their capacity and attain knowledge as far as ability permits. Out of every 100 who begin Latin, 31 pursue it only for one year.

Now why not do something for these 31! I have at present a section of 25 8A's who are mixed in with a section of 13 8B's. The majority of them have not passed 7B English and it was discovered that they had chosen Latin because they could not do English and thought they might succeed in a foreign language. Yet they do fair work and show great interest and we have to fail them because they can never measure up to the City-wide test. Does it encourage the growth of Latin when it is necessary to fail 50% of the pupils in order that the other 50% may pass a City-wide test? No!

Dr. Campbell has recently suggested a plan of having two groups of Modern Language students in the Senior High School. He suggests a two-fold grouping of students with the average and above average in one group, and the slow pupils in the other group. For the first group he suggests an enriched course of study and for the latter a course depending on their ability. He recommends that there be not left-backs in either group except for absence. Why couldn't some similar plan be accepted for Latin? This would surely be an encouragement in increasing the numbers. Who wants to begin a language and be dropped out at the end of the second term!

Furthermore we should have attractive Junior High School books. The old Senior High School texts are unsuited both in content and methods for Junior High School children.

Another way of encouraging Latin in the Junior High School is to improve the personnel of the teaching staff. Only 23 out of 63 Junior High School teachers are teaching Latin on a Latin license. In one school Latin was formerly taught by a drawing teacher. Yet the Principal wondered at the failure of the pupils. Should a French teacher have charge of Latin in the summer school? In one school a Domestic Science teacher teaches Latin. There should be more qualified teachers with Latin Licenses.

Also, the size of the groups in the Junior High School should be reduced if good results are to be obtained. I have four Latin sections, a 9B-RD combination with 38 pupils, a 9A-RC with 38, an 8B-8A combination with 38 and an RB group with 43 pupils. In addition I have an English section of 43 every day, an official class, three Coaching periods a week, a Club period, a Home-Room period, a Library period and the editing of the school newspaper. We also have lunchroom and basement duty and at least one hour of clerical work. Mrs. H., a French teacher, has a daily pupil load of 220, a section of 68 for two Coaching periods, a Library period of 44 pupils, a Home-Room, accompanies the 9B-RD Assembly, has charge of discipline in the Music period, and has a French Club. By reducing the size of the sections we could do more individual work and know our pupils by name.

In conclusion, I suggest more publicity and advertising of Latin, a closer articulation between Senior and Junior High School teachers, a live up-to-date course with credit for every-

Scanned with CamScanner

body, a reduction in the amount of material to be covered, a final test to be made by the Junior High School Latin teacher instead of the City-wide test, an improvement in the teaching personnel, the introduction of up-to-date Junior High School texts, an opportunity for every child to study Latin if he desires to, and a reduction in the size of sections. As long as the subject is so difficult that there are countless failures and the sections are so large that we don't know our pupils, so long will Latin continue to be at the foot of the ladder.

HARRISON CODAY.

P. S. 171, Brooklyn.

EDUCATIONAL NOTES AND ANNOUNCEMENTS

Said Robert of Sorbonne

To those of us to whom the use of proper study habits is a matter of constant concern, the following may prove of interest. It is culled from the work of one of the great teachers of the thirteenth century, Robert of Sorbonne, founder of the great universities there situated, who, in a treatise entitled "De Conscientia", set forth the following six essential rules to be followed by the student who would profit by his lesson:

1. "Consecrate a fixed hour to each study.
2. "Fix the attention upon what is read, and do not pass over it lightly. There is the same difference between reading and studying as between a host and a friend, a salute exchanged in the street and unalterable affection.
3. "Extract from daily reading, some thought, some truth, and engrave it upon the memory with special care. Seneca has said: 'When you cover much in a day, choose for yourself one thing which you extract from that day.'
4. "Write out a résumé, for words which are not confined to writing fly away like dust before the wind.
5. "Discuss the matter with fellow students in disputation or in familiar talk. This exercise is even more advantageous than reading, because it results in clearing up all doubts and all obscurities that the reading may have left. Nothing is perfectly known, unless bitten by the teeth of disputation.
6. "Pray; this is, in fact, one of the best means of learning."

"Certain students act like fools. They display their sublety in foolish things and show themselves destitute of understanding in important things. In order not to have seemed to have lost their time, they get together sheets of parchment and form thick volumes filled with leaves, blank on one side, and cover them with elegant bindings of red leather. Then they return to their fathers' houses with little sacks filled with knowledge, and with a mind completely empty. But, what is this knowledge that can be stolen by a robber, knowed by rats or worms, and destroyed by fire or water?"

A Report on "The New Sense of Duty as the Teacher Sees It": A speech by Mrs. Eleanor Roosevelt

Mrs. Roosevelt spoke last January at a dinner in her honor at the Women's City Club, of which she had at one time been vice-president, on "The New Sense of Duty As a Teacher Sees It."

She stressed the importance of having the pupils take an interest in economic conditions and their causes. Pupils must be made to feel their responsibility in knowing what is happening in the social, economic and political life of their state, their nation and also in other countries. They should study the past and its influence on the present.

Mrs. Roosevelt's students are asked to bring in subjects for discussion. So the other day she was asked to discuss technocracy. This she asked to be postponed until she had heard Mr. Scott's lecture and read more about it.

They should be taught, she said, to realize their parts as units in a great universe which they will affect by what they think and do. A nation, she said, was great only as its average citizen was great.

They, the pupils, must be willing to stand and to fight, not in the militaristic sense, for what is right. They should not wish their country to be a selfish one and to think only of its own good. It should be looked upon as one of the family of nations that wishes no good for itself that would be harmful to another.

It is for pupils to realize that it is their responsibility to make the world a new and better place to live in. True patriotism does not consist in proclaiming one's country is always right, that it is the greatest, and that one is willing to die for it; but in so living that it will be truly great.

The Summer Session of the University of Guadalajara, Mexico (June 29—Aug. 13)

The new method of teaching a foreign language, with the major emphasis on a recognition reading knowledge, affords students little opportunity of learning to speak it; but experience proves conclusively that a passive reading knowledge can be quickly converted in an active speaking mastery by a short residence in a foreign country.

Students and teachers of Spanish are offered an unusual opportunity, at a low cost, of perfecting further their reading ability and of changing it into a usable speaking accomplishment. The University of Guadalajara is located in a center of long-standing

Scanned with CamScanner

Spanish culture; students, without conscious effort, store away for future use those thousands of items, not recorded in text-books, pertaining to Spanish life and customs, at the fountain least Americanized of a university center within striking distance of the American border.

Some of the detailed advantages are:

1. An opportunity of pursuing undergraduate or graduate courses in Spanish and French, courses in education, history, geography, art, and social sciences, taught in Spanish by the regular staff of the University.

2. The opportunity to reap double benefits by studying French through the medium of Spanish, which also permits one in the most ideal manner known to classify and systematize the similarities and differences of the two languages.

3. Permission to earn six semester hours, accepted towards a bachelor's or a master's degree at face value by most American universities, including the University of California.

4. The opportunity of living as a paying guest, at a reasonable rate, in a cultured Spanish home in Mexico's second city.

5. The privilege of attending organized week-end trips to places of great scenic beauty and of interesting native life.

6. And last, but not least, the chance to enjoy an ideal climate where the average official July temperature is only 67.47 degrees Fahrenheit. In short, the unusual opportunity of making the summer both a pleasant vacation, and at the same time the occasion for increased linguistic and professional attainments.

For detailed information and descriptive printed matter, address the American representative and exchange professor for the summer.

The Decline of English

I wonder if any other teachers experience my feeling of helplessness and fright as the clouds of bad English come thick and fast, from radio and screen, song-sheet and tabloid. The English classroom seems but a tiny oasis in the desert of poor, inadequate expression.

I sometimes hear the modern songs as they steal into my window from a neighbor's radio, and I find myself listening to gibberish—syllables that form no words, words that form no sentences. It is as though the great public had demanded, "Give us sounds that will soothe our ears, but do not tax our weary minds." I am reminded of the inarticulateness of our primitive ancestors.

When the foes of English do consent to follow the tradition of words, what then? We get phrases and sentences of such thinness and insubstantiality that our tongues might be otiose than utter the one-syllable inanities of the modern love-song. There is a simplicity that spells art, but it cannot be confused with emptiness.

On the screen we find that, except in the rare instances where the text of a book or play of recognized worth is followed, the dialogue glorifies the American moron. In the name of succinct wit, we must listen to all the varieties of "Oh, yeah?" that screen-writers' ingenuity can provide. I remember a scene in the picturization of a prize-fighter's life, where the hero picked up, by chance, a volume of Browning's poems. With what a mincing voice did he mouth the lines, and what witty Americanisms followed, as he tossed the book aside! I thought of the impressionable children sitting there, attempting, perhaps, to reconcile the scene with one in the English classroom, when the poet's lines were more appreciatively rendered. Why should the English teacher be forced to contend against so strong a foe?

The tabloid needs no further criticism, for it has now been the target of ridicule for so many years that some of our disdain for its sheets has been transferred to the minds of our pupils. Not so often, though, does there appear criticism of the billboard, except from the aesthetic viewpoint. Casual observation on my part has revealed such faults of spelling and grammar as the following:

1. *Alright*, for *all right*.
2. *To* for *too*, and vice versa.
3. The apostrophe to denote simple plural.
4. Plural subjects and singular verbs, and vice versa.
5. Sentence errors.

The names of advertisers are discreetly withheld!

Outside the high school where I teach, men station themselves at the close of the afternoon session with large yellow sheets with the precious words of the very latest songs. To tempt customers, they call out the silly lines that open the silly songs, and out come the nickels. But a few minutes before, perhaps, these eager girls were listening to "Drink to me only with thine eyes," or "Lovers and madmen have such seething brains," or "Euclid alone has looked on beauty bare." What success would I have, I wonder, if I offered full and complete words of such selections for five cents?

Other ages have had their faults, too, in language, but surely none offended with such aridity of words and thoughts as now confronts us. How welcome would the conceits and puns and verbal enthusiasms of the Elizabethans be, in this age of the decline of English!

REVIEW

An Evaluation of History Texts—A Check List

By Miriam A. Compton. McKinley Publishing Company, Philadelphia, 1932.

Throughout the United States, history texts are used as the basis for instruction in history from the early grades in the elementary school through the last grade in the senior high school. Who is responsible for the selection of these texts? Would those on whose shoulders the responsibility rests feel uneasy if asked questions of this nature: Did the objectives of teaching history in the particular grade play a part in the choice? What criteria were used in the evaluation of the text? How much time was spent examining the text that was selected? Precisely what factors prompted the selection of a particular text among the host of texts?

Few teachers would question the value of a text in the teaching of history. Most teachers of history would agree with the author that for an inexperienced teacher "the book used can make or break the course." Even the experienced teacher would find that an inferior text may prove to be an insurmountable handicap. It is obvious, therefore, that a scientific method for choosing a history text is of vital importance.

"But how," the harassed supervisor might ask, "should I have proceeded in my choice of texts for the different grades in my school?" This question the writer answers at great length.

Criteria are set up for the choosing of any history text. These criteria are divided into nine parts. Under each major criterion there are a number of questions. All in all, about three hundred questions, well organized, well chosen and pertinent, are asked, ranging in importance from the name of the publisher to one asking if the purpose of the book meets the needs of the course for which the book is to be chosen. These questions are followed by a key manual explaining in great detail the use of the check list. Each question on the check list is analyzed.

Despite the fact that choosing a text in this way requires the expenditure of a considerable amount of time, the supervisor may turn to the check list with a sigh of relief. It offers an objective, scientific method for choosing a text-book. Evaluation in this manner would certainly lead to a suitable book. The supervisor will no longer be plagued with the thought that he might possibly have handicapped his teacher by an unwise choice of a text and is, therefore, responsible for deficiencies on the part of teacher and pupil.

LACK OF EDUCATION A CAUSE OF BANKRUPTCY

TWO years ago United States Commissioner of Education William John Cooper said, "One of the difficulties with American business today is that in it are too many who dropped out of school before they had sufficient education to meet life's problems intelligently and to be able to think straight in relating brain success to permanent economic security."

Now the Commerce Department has documented his observation. The Commerce Department has made a study of the causes of 570 commercial bankruptcies.

This is what it found: "Over 40 per cent of the total group of 570 bankrupts did not finish grade school. Approximately 70 per cent were not high school graduates, although there were 145 high school graduates in the group. Less than 10 per cent were college graduates."

We will not let any man serve us as a doctor until he has had a minimum of 18 years of education. But we set up no educational requirements for our bankers. We require 16 years of education for the pharmacist who prepares our prescriptions, but we never ask the man who runs the drug store if he spent a day in school. A girl must have 15 years of education to be a nurse but a boy can be a business man without having passed fifth grade.

Another study recently completed ("American Business Leaders," by F. W. Taussig, Harvard University) shows that one-fourth of the **leading** business men of America had only eighth-grade education. One per cent, in fact, had no schooling at all.

It appears that we have set up no educational qualifications for some of the most vital positions in American life. When businesses fail, when business men make poor judgments, we all suffer. Yet we intrust some of the crucial tasks of business management to persons whose educational equipment is so meager that they could not enter any of the professions. Some of them could not even be candidates for a skilled trade like plumbing.

Commenting on the relation of education to bankruptcies the Commerce Department says: "It may be inferred from the above facts that lack of education in many cases was a contributing cause of failure. Knowledge and training can be acquired both in school and through experience, but the disproportionate use of either method, except in unusual cases, is not conducive to success. The majority of the bankrupts did not secure the necessary knowledge and training in school."

LATIN AND BOYS*

YOU ALL know what a chemical compound is, and the distinction between a physical mixture and a chemical compound. It seemed to me, when I was asked to address you, that the subject might appear, superficially, like a physical mixture, in which the elements each retain their own characteristics.

But that, of course, is a false belief. It was spread abroad by some old grammarian who had a formidable idea that unless you make a medicine distasteful, it will not have a beneficial effect. The pill, it was thought, must be sugar-coated. And that idea, despite all the centuries that have passed since then, has still persisted. If Latin is so impossibly hard, it is said, then it must be given up half-way, surrendered however ignominiously, and an attack made upon another and presumably simpler subject.

Of course it is true that Latin is not easy in the sense that it requires no personal activity, that one can sit back and absorb the language passively, without effort. On the other hand, it is not true that the language is so insuperably difficult as to evade mastery over it. St. Augustine regrets, in his "Confessions," that as a schoolboy in North Africa he did not like Latin because he had to do arithmetic in Latin and go over the multiplication table so often: "Sed peccabam puer, cum inania utilioribus praeponebam. Iam vero 'unum et unum duo, duo et duo quattuor' odiosa cantio mihi erat, et dulcissimum spectaculum erat equus ligneus plenus armatorum, et Troiae incendium atque ipsius umbra Creusae."

Augustine goes on to lament: "What misery I experienced when, as a boy, I was rightly told to follow advice, if I wanted to be successful and excel in those language studies that contribute to human glory and hollow wealth! Then I was sent to school to study literature, in which, in my stupidity, I did not see what was of use. And yet if I was slow in learning, I was punished. For our elders praised this method, and many before us had laid out the paths of sorrow which we were compelled to traverse with manifold labor. Yet I sinned in writing or reading or thinking less about literature than was demanded of me. For it was not that I lacked memory or talent, of which I had sufficient considering my age, but I liked to play, and punishment was inflicted upon us by those who used to do the same thing. But the trivialities of our elders were called 'activities.' Now since boys' activities are of this kind, they are punished by their elders and nobody pities boys. Unless someone approves

* Read before The Torch Club, Greenwich, Conn., December 9, 1932.

Scanned with CamScanner

my having been punished because as a boy I played ball and that game prevented me from rapid progress in literature. Did the man who punished me do otherwise himself? If he was ever defeated by some fellow-schoolmaster in connection with some trifling question, he would fall into greater rage and jealousy than I would, whenever I was beaten in a ball game by a fellow-student."

Is there anything antiquated about this passage? Does it not sound like the plaint of some present-day high school student? But Augustine does not stop there. He gasped with wonder and praise when a new field, Latin literature proper, came into his ken, when he entered upon the study of Vergil, when he began to understand the poets and had left far behind the grammatical elements of Latin.

In spirit and in essential characteristics, in spite of all that you may think, boys have not changed since young David defied the ponderous Philistine, or since the lads of Pompeii, that wild coast town in Italy, went rollicking home after school and filled the town walls with graffiti, Latin scribblings that are still extant; or since the days of this same Augustine himself. Boys are universal in type, and what the young Roman boy liked or disliked creates the same effect upon you. A Roman boy went to school at dawn, his *pedisequus* carrying a lantern to guide him. He remained in the cramped room of his teacher, possibly on the upper floor of a skyscraper or *insula*, for hours on end, and came home only at sun-down. And what did he do in school? He listened to the murmurous tales of wandering Greeks (and sometimes an exiled Greek philosopher would actually come in to listen), to the vibrant stories of Hercules, the thudding centaurs, the tumult of Troy astir with battle, and the limitless undertakings of godlike heroes, the toilsome trials of Aeneas, the passion of Dido. And he listened to all this and laboriously copied out the tale as his teacher chanted it. Of course, now and then, a boy would scribble some poem or other on his tablets, or fall into a glamorous dream — and then his teacher would awaken him with floggings, as did the poet Horace. Or, when the days grew warm, and the fever of restlessness entered the stuffy classroom, the boys would go and beg a kindly poet to scribble a little rhyming excuse to the teacher, and the poet, like Martial, would readily do so.

What did the boys dream about as they sat with drifting thoughts before the old *ludi magister*? They dreamed of the things that modern boys think far removed from Latin. They dreamed of flaming stories of castaways, far-flung desert islands, children kidnapped by sea pirates, prowling detectives, last-minute escapes. Each story that the Roman boy heard from his teacher was an opening to high adventure and unspoken mysteries. But the Roman boy, even with Latin as his mother tongue, did not get all this readily. He had to give himself entirely to the study of the language.

The high school student often forgets that learning a language is an architectural achievement. You cannot stop when the structure is half-built and say you are tired, or begin to criticize it because there is no top to it. The Romans knew this; they themselves were architects of language as well as of brick. There is an old bridge in the north of Britain that I have often crossed; it was built by Roman *fabri* almost 1800 years ago, and it is still standing, in good repair. That is a symbol, as it were, of the Roman idea of perfection and utter achievement. In spite of all kinds of assaults, in spite of what some scribblers in newspapers say, Latin survives. You cannot condemn a thing if you do not know it well; and only those who have mastered Latin can condemn it and rend it apart; and yet that is just what they do not do. On the contrary, they encourage others to go on the same difficult, perhaps lonely road, because each one will find his own salvation in it.

You will perhaps not unreasonably ask: What is there for me, as a high school student, in Latin? It is, they say, so remote, it does not deal with current events, it is not a spoken language, its subject matter is so distant from our interests. But you would be entirely wrong to think so. Latin is alive; it is spoken; it does deal with all that interests a human being.

Perhaps you would like, instead of Caesar, an adventure story in Latin? Fights with robbers in underground caves? Strange scenes of magical transformations? You will find all these things in the wonderful novel of Apuleius — the "Metamorphoses or The Golden Ass." Do you want one of those picaresque novels, full of vivid descriptions, illuminating episodes, rich and realistic characterization? Do you want a hilarious parody of Nero's antics, and a gorgeous banquet at the home of one of the most comical personalities in all literature? Then turn to the "Satyricon" of Petronius, and particularly to the "Cena Trimalchionis." Are you fond of detective stories? Then you may read in Latin "The Blood-stained Wall." Are you interested in witchcraft and eerie doings? Then read, some dark night, "The Spell-bound Tomb." You can even get Sherlock Holmes and E. A. Poe and Robinson Crusoe and R. L. Stevenson all translated into Latin. Omar Khayyam has been so translated, and Shakespeare's "Julius Caesar," Gray's "Elegy," and "The Deserted Village."

You think that Latin is remote from actual events? There are Latin magazines published now, as far away as Spain and Holland, that deal with the economic, political and literary situation. Latin has begun to compete vigorously with the newspaper and the monthly magazine. We are familiar with such productions in modern languages, but in Latin this is a new development. In an academic sense, of course, there have been many experiments in Latin. "Paradise Lost" has been translated into Latin on several occasions; the Psalms of David

Scanned with CamScanner

have likewise been so treated. Some of the poetry of Keats and such like things have been transmuted into Latin. But now Latin is stepping out into the marketplace, entering into national activities, and commenting on the trend of events. This is done through the medium of the Latin magazine. As Latin was the international tongue of intellectual Europe until the seventeenth century, so it is again resuming its international character. Latin magazines have appeared in New York, in Madrid, in Poland, and in Italy. Some of them are illustrated; others are more placid in appearance. They comment on news, on public personalities; contain book reviews, sketches, short stories. Reaching deeper into the intellectual life of the present day, Latin is thus keeping in close touch with actualities and in a very real sense is thus contributing to international understanding.

You think Latin cannot be spoken? Of course it can, and is, although the essential virtues of the language may be secured without that. Lectures are even now delivered in many European universities in Latin. At the national colleges in Rome, where Greeks and Chinese and Persians and Ethiopians gather together as students, Latin is spoken as the common medium among all these divergent nations. A Chinese student takes up a text of Caesar and reads it through in one evening. An Abyssinian bishop addresses the Pope in Latin. Kemal Pasha introduces the Latin alphabet into Turkey, and already Vergil's "Aeneid" and the shorter poems can be read in Turkish. During the Great War I myself, while in Italy, had to make use of Latin; and it was fairly easy to make the Italian peasants understand what one wanted. Again, during the war, in France, I had a pocket edition of Caesar, and went over some of the ground where Caesar's campaigns had been fought, and where they fought again during the war. There are schools in England where the classes are conducted entirely in Latin, and where the boys attain a good mastery of the language. The recent Latin address by the Pope came like a linguistic trumpet blast. It was one more proof of the vitality and adaptability of the language to modern conditions and ideas. At the International Catholic Conferences men gather from all quarters of the earth and make Latin their common tongue. At Oxford University the Public Orator introduces candidates by a Latin eulogy. In Washington, D. C., at the Dominican House, there is an annual Disputatio Solennis in mediaeval dialectics, carried on in Latin. It is particularly in the ecclesiastical sphere that Latin has retained its pliability. The priest is the direct descendant of the wandering scholar and of the monk who copied out manuscripts in the scriptorium. The Archbishop of York still signs himself "Ebor.", an abbreviation that carries us back to the Latin name of York. At the Vatican Councils bishops of different nationalities assemble and talk extemporaneously in Latin.

And not only in the more academic and scholarly fields is Latin holding its own. It is being reintroduced in unusual places and in novel circumstances. In Rome, at the present day, there is beginning a Renaissance of Latin as a national language. Hotels, barbers' establishments, and stores are budding forth with Latin signs, notices and advertisements. Latin is once again tending to become the language of the Roman plebs. Barbers, accustomed hitherto to French designations, have at last rebelled, and have now adorned their shops with *Comae Barbaeque Tonsor.* One barber, specializing in hair washes, announces: *Officina comis abluendis.* A manicurist displays a sign: *Magister manibus curandis.*

Deferred payments are invited in the phrase, *Subnotatio in mensem.* A hotel keeper, proud of his business, puts up a sign, *Aedes primi ordinis.* Another declares: *Frequentata ab Eminentissimis Cardinalibus et Clarissimis Praelatis.* Another says: *Cubicula cum singulis balneis.* In a restaurant we find the notice: *Amplissima atria pro conviviis* and *Mediocria pretia.*

An ecclesiastical tailor styles himself: *Praebitor Sacri Palati Apostolici.* In a certain bank the notice *Litterae Bancariae* indicates letters of credit. In one restaurant in Rome all the rooms are covered with Latin inscriptions from Horace, Ovid, and Catullus, and even the wine is brought in a genuine Roman amphora.

And with all this more amusing side to it, Latin can be at the same time a powerful intellectual stimulus.

I had once read in school the life of Alexander the Great, by Quintus Curtius, and after some time the text became merged in my memory. When I was in India it all came back to me. I saw some of the relics of Alexander's march into India, and the remains of the cities he had founded. I heard the wild Pathans of Afghanistan tell each other, in their guttural Pushtu tongue that I had studied, old, forgotten tales about Iskander, and how long years ago he came from out the west, marching with his tumultuous mercenaries on to new conquests, cutting through Afghanistan and spreading far down into India. Here was a reality I had little expected. To read, as a school boy, a biography of an old Greek general, dead these many centuries, and then suddenly to come upon tangible evidences of this very man and his conquests! And Latin is full of such adventures.

It is true that you must master the rudiments. But then a Roman boy of your own age had the same thing to do. Horace, the Roman poet and satirist, tells us how painful studying was to him, as his teacher, Orbilius, was fond of using a cane. There is the story of the boy who was given an assignment by his teacher. He could not do it, and sat dejectedly, when all at once a man appeared from nowhere and offered to do the assignment for him if the boy would give him his soul. The boy, of course, had no use for his soul, and willingly surrendered it. In exchange he received the assignment, all perfectly done. But the teacher was suspicious, and questioned the boy, who finally confessed that a man had helped him.

Scanned with CamScanner

And of course it was the devil who had helped him. There is a warning in this mediaeval story, and a salutary one. But it is true that the rudiments of Latin caused Roman boys to make mistakes just as boys do nowadays. Aulus Gellius, a grammarian of the first century A. D., collected some of these mistakes, and commented on them. They are mistakes in gender, in number, in conjugations, in the wrong choice of words. In later times, candidates for the priesthood, when examined in their knowledge of Latin, often made ludicrous mistakes. But once you have surmounted such obstacles, you will find things of wonderful interest and immense intellectual importance.

Sometimes you may grow a little weary of Caesar's campaigns, of attacks, counter-attacks; you may even resent the smugness of Cicero's rolling periodic sentences. But that is not all Latin. You need not stop there. You cannot read everything that has been written in Latin, but you ought to know its possibilities, the expansiveness and extent of Latin literature. You may read the adventurous narrative of St. Brendan, the sixth century monk, and the cycle of Arthurian legends, the rollicking Goliardic songs, the dramas of Hrotsvitha, the German nun, Ammianus Marcellinus' despatches from the front as a war correspondent with the emperor Julian; or the weird magical practices of Apuleius; the autobiography of Augustine and his very modern remarks about schools and studies. There is Jordanes' history of Attila the Hun, and Bede's history, full of anecdotes that will appeal to you. Then there are stories of treasures in Paul the Deacon. Liudprand, a mediaeval ambassador, relates his experiences in the cosmopolitan city of Constantinople. You can read in Latin about Leif Ericcson's voyage of discovery to America; Arab fables; the Gesta Romanorum; the adventures of Apollonius, king of Tyre, and how a fisherman rescued him. You have other such stories in the cycle of The Seven Wise Men, and the letters, sketches, and dialogues of Erasmus.

You must not think, however, that Latin is entirely a matter of amusing anecdotes. I have mentioned such things so that you may know that there are such things in Latin. But beyond the merely entertaining things you will find inspiring things that will guide you: examples of heroism not only on the battle field, but in the daily routine of living; wise philosophies garnered from rich human experiences and reflections on life and human activities. Latin, in fact, ultimately becomes more than a language that one learns for its own sake; it is an epitome of a culture that for no small period of time was practically universal in its influence.

Seward Park High School.

RADIO PROGRAMS ON ART

THE following articles are taken from the series of Radio talks on Art given during the month of March over WNYC by members of the Art Department of the high schools.

SUBJECT—"ART APPRECIATION"
MARCH 1, 1933

MR. FOREST GRANT, Director of Art: This is the first of a series of Art programs which the High School Art Department, in coöperation with the Music Department has planned to put on the air. These broadcasts, approved by Deputy Superintendent Campbell, are made through the courtesy of WNYC and the kindness of Mr. Winfield Rice, Director of Civics. It is hoped that we can give to those listening in a very correct idea of the Art work done in the City high schools. The Art work has changed so radically during the past five or six years that if those who used to be pupils in the old time drawing classes could return to their schools they would be amazed to see the progress that has been made in the teaching and study of Art. In order adequately to cover the ground it has been necessary, of course, to select fields of Art differing widely in character. Tonight we shall speak about the required Art of the High Schools—Art Appreciation.

I wonder if many of you who are listening in have stopped to think about your environment long enough to realize that we are literally surrounded by the products of Art activity. Everything we wear, everything we have in our homes, even the very walls themselves have been designed. Someone has given thought to the making of every object we possess. Its material, its shape, its length, breadth and thickness and the coloring are a few of the things that have been considered by those interested in its manufacture.

It often happens, of course, that much of this material is very poor Art. That is because little thought or a very poor grade of thought has been expended on its design. Much more often, however, the furnishings of our homes, our dress and other material that we own are in poor taste because we are not good choosers.

Fortunately for us, the really up-to-date stores have known this for some time and in order to furnish perfect service are giving their salesmen and saleswomen courses in the appreciation of Art that they may be prepared to give correct advice to customers, who very often have to solve problems that require the keenest discriminating judgment. To be helpful in solving such problems, one must not only have a thorough knowledge of the principles of design, but also a refined and cultivated taste in the choice of materials and color.

The course in Art Appreciation aims to develop the ability on the part of every boy and girl to make the

Scanned with CamScanner

right choices between the good and the less good in all forms of Art endeavor. We believe that youth is inherently interested in Art, and that we as educators have enough ingenuity to develop that interest in a manner that will prove most beneficial to the student during his whole life. The fact that there is at present a great wave of Art interest sweeping over our country proves to us that this is a most opportune time to satisfy this interest and thus win for Art many devoted friends.

It is most significant that at last the Art departments of many Women's Clubs have given up the old idea that the way to help Art in America is by amusing their over-amused members with occasional talks by expensive speakers. Instead, under the leadership of Mrs. Howard Green, they are sponsoring a country-wide educational campaign that is stressing the adoption of the study of Art Appreciation in every high school in the country. Such a movement, fostered as a part of the program of all Art Societies, would soon create such a strong demand for an "Art Education for All" that school authorities would feel more than justified in satisfying it.

Now it so happens that there are many, even in the educational world, who do not know what the study of Art from an Art Appreciation standpoint means. I also know from the inquiries I have had from different parts of the country that there are many who want to know how the work is done—what the instruction is like. Unfortunately, we cannot show you over the radio, but after you have listened to the two experts who are to speak tonight you will not only clearly understand why students are enjoying Art study; why they are developing unusual interest in all things artistic; why the training of the consumer of Art is so necessary to the future creators of Art, but you will also feel like doing all you can for the furtherance of similar work in your community.

It is now a great pleasure to introduce to you Miss Helen Hutchinson, Head of the Art Department of the Morris High School.

MISS HUTCHINSON: Now Radio Listeners, come with me to one of our crowded city high schools for girls and boys, just for a short time. The signal for the beginning of a class recitation has sounded and a group of young people have gathered in an Art room, awaiting expectantly the development of another new and interesting project.

To most of these girls and boys this Art period is a bright spot in the school day. To begin with, the Art instructor has made the room a most attractive place. On the walls are finely arranged panels of illustrative material showing how art enters into the many everyday experiences of us all. These exhibits, very frequently changed, and always up-to-date, are a source of great interest to the classes and the object of many a lively discussion. Charming bits of color flash from posters, pictures, pottery and things of beauty which have been borrowed from the Museums, creating an atmosphere which tends to arouse to a greater consciousness the pupils' interest in everything that is fine. The pupils know that the lesson is going to be interesting and instructive, for previous experiences in this room have convinced them that they really are beginning to discover beauty in things about them, of which formerly they were unaware. Take the interesting subject of Civic Art and City Planning which occupied a former lesson after an animated discussion of the new Radio City. These modern buildings became, to the girls and boys, beautiful balanced architectural masses, satisfying in their harmonious repetition of line and rhythm of areas. How eagerly they collected pictures of the skyscrapers here in the city, compared the merits of their designs and as a class project modelled the buildings of the Radio City in soap, grouping them in a setting which, in the opinion of these young people, allowed for a better appreciation of the architectural design than does the present arrangement. The contemplated change in the City Hall Park was discussed with great interest and the pupils encouraged to present, for class study, problems pertaining to the betterment of their own immediate locality. Civic Art is not a fad, it is a serious problem which faces every citizen. We must realize that it is most important that the individual help make his city the ideal and by cultivating in the children a love of beauty and a pride in their city there is a surety that the plans for civic improvement will progress in the right direction in the next generation.

And then the Automobile Show with its beauty contest. How eager the boys were to tell about the latest models with their pronounced stream lines and attractive color schemes! In no time at all, led on by an enthusiastic teacher, the class was all agog to tell how art seemed to be affecting other things in industry—these machine-made things, which for so long a time have been conspicuously ugly. Pictures, thrown on the screen in the classroom, showed the transformation of the bathrooms and the kitchens in our homes, due to the effort of the designers to put grace, charm and color in the common objects of everyday use—these rooms now resplendent in harmonious color schemes, finely decorated walls and floors and beautifully designed accessories. Better design in electrical appliances, finer shapes in modern glassware, silverware and countless other things. These new creations with their deeper satisfaction of good form and graceful line were compared with the older designs and constant judging and selecting encouraged, examples of good and bad mounted in their note-books until the children were able to recognize the art values as well as the practical values of these articles.

Then came the interesting creative problems when the girls and boys, regardless of their ability to draw, sketched many of their own ideas for some of these industrial products, carrying them to completion by helpful class criticisms and attention, always,

Scanned with CamScanner

to the principles governing beauty of design. This creative work is of the utmost importance, for art appreciation is not mere knowledge. It is gained best through experience; and by putting their hands to work and following through a problem just as an artist tackles it, these girls and boys will learn by feeling what neither books nor museums can teach. Creative work is the straight gate to appreciation.

I remember the interesting work carried on last year in the art appreciation classes when the spirit of Colonial days was recalled so vividly by the erection of the beautiful buildings reminiscent of Washington's time. What a quantity of fine things in which to interest our girls and boys—the simple beauty and grace of the early architecture of Colonial days, the classical influence in the beautiful molded panelling, cornices and other details in the late American Colonial structures, and then the graceful shapes of the Stiegel glass, the pewter, the characteristic designs in the rugs and counterpanes! The furniture, especially, appealed to the classes after visits had been made to the special buildings erected, so at once a class project centered about that particular phase of Colonial industry. Visits were made to the American Wing of the Metropolitan Art Museum and there the teachers pointed out the various styles originated by the early Colonial cabinet makers and influenced by the work of the English designers.

The class noted the fine design, honest construction, beautiful simplicity and fitness to purpose that the furniture showed so plainly. Then back to the classroom where many pictures of these designs were thrown on the screen, along with modern custom-made furniture designs, some of which were in sharp contrast to the beautiful things they had seen. The class was encouraged to discuss line and proportion, materials and use of ornamentation. Visits were made, this time, to the Van Cortlandt House and the Jumel Mansion, permanent Colonial museums in our city, for further investigations. Note-books were made, showing many types of furniture designs, good and bad, individual comments accompanying each mounted illustration, telling why certain designs were better than others. Original sketches of furniture showing the outstanding merits of Colonial styles and tracings of the charming designs and graceful contours of the old types were made while some classes assembled an illustrated story of Colonial furniture, different groups in the classes contributing certain parts to make an interesting whole. What better way could there be to make our boys and girls conscious of beauty in structural design? They are to be the future buyers of our industrial products and it is of the utmost importance that they be able to distinguish between the thing that is good and that one which is mediocre.

One of the outstanding aims of the Art Appreciation work is to expose the girls and boys constantly to things which are in good taste and to lay a basis for sound judgment which shall

prove, in later years, a valuable working tool. We know that if they learn to appreciate beauty of form and color now, while they are in school, when they grow older they will demand things which are fine and beautiful and do without rather than accept what is commonplace or ugly. In this way we may hope for an art in our industry which is worthy of American ideals.

And so, having learned to see beauty in the everyday things of school, community and home life, the pupils are eager to look beyond their immediate surroundings and to welcome enthusiastically the class talks and the trips to the museums, in which the beauties of the finest achievements in architecture, painting and sculpture, as well as the work of the master craftsmen of all ages, are gradually unfolded to them. They begin to appreciate the qualities which make these treasures beautiful and in a short time they are deriving real enjoyment from a study of fine things, realizing that one measuring stick is used to determine the artistic merits of a creative expression, be the expression a simple vase or a colorful composition for a painting.

The theatre with its great possibilities of artistic expression, the making of fine books, which opens up the delightful subjects of graphic arts and typography, and photography, the new tool in modern commercial illustration, are a few of the topics planned for discussion. Watch the numbers who swarm about the art instructor's desk during the interval between classes. Some are waving pictures they have clipped from newspapers; some have tried out original ideas at home and are eager to show the results; a girl is trying to tell how she liked the modern decoration in the new Roxy Theatre; and there are always a few who must tell you that they spent all the previous Saturday morning at the Art Museum and that they just loved it. No need to worry how these girls and boys will spend their leisure time when they grow older! An understanding and appreciation of some form of art is going to be of lasting satisfaction to a great many of them.

Let me quote, in part, what one of our leading business men has said about the value of art in one's life:

"Art is not a high brow thing or a plaything of the rich. Art is virile, red blooded, of the people, for the people. It is a mighty element for civic improvement and it is a powerful educational factor. It can be made one of the strongest among those agencies which have the power to influence the conception, the attitude, the ways and manners of the people. It teaches people to appreciate the things which are fine and high and inspiring and breeds aversion for those which are vulgar and degrading. Art is actually an investment which yields dividends in dollars and cents."

MR. GRANT: We are now to hear of the Art Appreciation work as it is carried on in a girls' high school. The speaker, Miss Edna Black, is an instructor in the well known Washington Irving High School.

Scanned with CamScanner

MISS BLACK: I wish, if there are any grown people listening in tonight, that they might come to some of our Art Appreciation classes in the Washington Irving High School, for it has been my experience that casual adult visitors have been deeply interested in what was going on, have been deeply attentive and have usually lingered to remark, "How I wish I could have had something like this when I went to school." Even our students, who, in true student fashion, take things very much for granted, usually voice their regret when their course is finished. We hope, as Mr. Grant has remarked, that it is at once one of the most practical and cultural courses in the curriculum, touching life at every point, widening horizons, interpreting both the past and the present.

As our students are children when they come to us, I like to base my work on the childhood of man and his Arts. Hence we search out everything we can of primitive man and his avenues of expression. For in less civilized and perhaps happier times man expressed his needs in all the Arts, naturally and freely, decorating his body and weapons, chanting tales of his great prowess, making images of and building temples to his terrible and beneficent gods. Perhaps this was in a way the Garden of Eden from which man has gradually eliminated himself by becoming self-conscious and inhibited, a spectator instead of a participator, a being abashed and scornful before what should represent the soul of him. So taking our youngsters unspoiled and fearless, we like to pretend that we are still savages and that we, too, can make good patterns and drawings if we are not afraid and if we do not try to imitate, for we must realize that our Art is right within us, and we have no need or right to copy the expression of some one else, for ours may be as good as his, and it is ours.

Then, and then only, do we compare and talk about our productions and from the statements given formulate rules and test them out in all sorts of ways, for if they are good rules they will prove universal and we can apply them to the measuring of all sorts of things or to any problem which confronts us. For certain lines and colors and shapes have an affinity, belong together, and express certain things. And thus a girl may analyze herself as to coloring, line and type and plan her wardrobe accordingly, eliminating waste and chance. In another term we take up our homes or the homes we hope to have, and build up a logical plan of attack which could be utilized in any situation in which we might find ourselves. For our homes reveal us to others and we all wish to be revealed in the best light and to learn that a problem solved as to convenience, comfort and utility may also spell beauty.

Through all this and related to it, we also discuss architecture and the Fine Arts and we discover that each people or age inevitably expresses itself in lines and shapes which betray its soul or temper to those who read the signs aright. As the straight lines and flat surfaces of Egypt signify inertia and a magnificent contempt for time, and the logic and genius of the mind of ancient Greece is revealed in the flawlessness of the Greek architecture, so looking about us we may also interpret the beauty and majesty of our great structures as a symbol of the soul of the time which produces them.

And on our walks about the city, if our eyes are opened, we may see bits of ancient Greece and Rome or the Orient, and we are able to judge for ourselves whether it is a fitting part of the structure; adding to and enriching the design or serving no purpose cheapens and detracts, and then we know it to be false. We like to know why our little City Hall, a tiny jewel among its great neighbors, has been decided by the unanimous consent of our architects to be the finest public building of all the great public buildings of our City; and of the monuments in the adjacent park, to observe two famous statues and to decide why one is good and one is poor.

We discuss new additions of Art objects in our school and vicinity, window decorations and advertising, and we note that our simple rules faithfully applied still hold of one idea of theme and everything relating to that idea of variety, of simplicity, for these rules are universal.

In touching the painting and sculpture of various countries, we note that these Arts flourish best when they figure most in the lives of the people, as in Florence, when each and every citizen was a competent art critic and where the workshop of the artist was always open to the public; or earlier in Sina, when the painting of a new Madonna was an occasion for public rejoicing and a holiday; and we conclude that artists must have the incentive of public understanding to reach their highest level of accomplishment and that we, too, in time to come, will be judged, not for our material achievements, but by the standard of Art we leave behind us, for as some poet has succinctly remarked:

"All passes, art alone
Enduring stays to us;
The bust outlasts the throne,
The coin Tiberius."

MR. GRANT: You have just heard Miss Helen Hutchinson of the Art Department of Morris High School, and Miss Edna Black of the Art Department of the Washington Irving High School, speak of the Art Appreciation work done in the New York City high schools. I have no doubt many of you would like to join these classes and I am sorry that you cannot do so. However, we all want you to know that it is never too late to study Art from the standpoint of Appreciation. Personally, I want you to know that what these young women have said applies to practically all of the high schools in New York City. In each one the students are following this work with enthusiasm.

Next week we speak of "Art for Boys."

SUBJECT—"ART FOR BOYS"
(March 8, 1933)

MR. GRANT: In general it may be said that the educational work in Art in New York aims to give every boy

Scanned with CamScanner

in the elementary, junior and senior high schools a chance to develop a happy and wholesome interest in and a broad understanding of many kinds of art endeavor. The talented boy is given the additional opportunity to study intensively that particular phase of Art in which he is especially interested. For these students there are offered in the different high schools major courses in freehand drawing, design, color study, costume design, costume illustration, interior decoration, craft work, stage design and commercial design.

Girls find great interest in many of these advanced subjects, but in the past these subjects have not appealed so strongly to boys of high school age. Boys have been inclined to regard good taste as something that belongs to girls. We are glad to say that that day has gone. Now good taste and a sound art judgment are considered a financial asset to any young man and particularly so to those who are just entering business. Ordinary common sense assures all that the boy with a broad knowledge of color and a deep appreciation of good design is of much more value as a salesman than one who is sure to confuse buyers with advice not based on art understanding. The real worth of so much of the manufactured products today depends on its Art that boys (with keen eyes upon future success) are now looking to the Art Department for help because they realize that in no other place can they find the reliable information that they need.

Not long ago a well-groomed young man who left his high school course at the end of his first year assured me that if he could only return to the High School of Commerce and take the color work given there he could triple his salary as a salesman.

The two advanced subjects that appeal most strongly and that have in them the content for the development of Art judgment that is most valuable to boys are stage design and commercial design.

In considering the first of these topics, I hope that you will note the number of Art subjects that must be considered by the student during the course of his study. Everything in Art that we want a business man to understand is studied intensively and with an interest that makes teaching most delightful.

It is a very great pleasure to introduce to you Miss Virginia Murphy, Chairman of the Art Department of the Erasmus Hall High School, who will discuss with one of the young men from this Flatbush institution, the value of the course in stage design as given in that school.

MISS MURPHY: The Art departments of the high schools of New York City offer an excellent opportunity to boys to experiment with this most fascinating, most composite of the arts. The purpose of the Stage Design Course is not to train students to enter the profession upon graduation, though some may be interested to study further, but to give the boy his best chance for a real education.

One of the boys from my school, Erasmus Hall High School, Brooklyn, has a few questions to ask about the course in stage design. This student, Gerald Charm, is in another art course, but I have found him intently watching the marionette class from the door, and I shall take this opportunity to answer some of the questions he and the other boys are constantly asking.

STUDENT: Miss Murphy, if this course in Stage Design doesn't lead directly to a job, why do so many of the boys want to take it?

MISS MURPHY: Because there is a universal appeal in watching a "show," from the most finished drama on the stage to the simplest demonstration in a drugstore window. It's a common instinct, everyone likes showmanship. There is only one instinct that is stronger, and that is the desire to go behind the scenes to see how it is done.

Therein lies the real reason for the interest in a stage design class. The boys are not merely looking on behind the scenes, they are creating those scenes, lighting them, and eagerly checking the effect of each change upon the audience. They exchange places constantly, being audience, scene designer, actor or electrician by turns. Through this constant shifting they learn the requirements of each phase of the work and the interdependence of the varied arts of the theatre, one upon the other. It is a real coöperative job, and the success of the play depends upon the sincerity and high standards of each student workman and the coöperation of the group.

STUDENT: Do the boys receive credit for the course, or is there some special inducement for it?

MISS MURPHY: The usual credit is given, but it is not necessary to induce boys to take a course in Stage Design. Only give them the opportunity, time on the program, a place to work, and a competent teacher, and there will be no cutting in that class. There will be no discipline problem except to get the boys to stop in order to reach the next recitation in time.

STUDENT: Does a fellow have to have special talent to get into those classes?

MISS MURPHY: In such a group there is a place for every boy, for the work calls for pure imagination in creating new visual interpretations of a play, at the same time demanding such practical things as working drawings, carpentry and experiments with color lighting.

I have met many boys of varied interests and abilities, but I've never known the boy who could not be reached and interested through participation in Stage Design.

STUDENT: Is most of the work drawing and painting?

MISS MURPHY: No, it calls first for good common sense, then it touches, in one way or another, most of the subjects in the curriculum. First, we must select or write a play. This calls for careful study of fine dramatic literature and involves the reading of many plans, not the im-

Scanned with CamScanner

mediate selection of a second rate "Broadway success". The fact that settings and costumes must be designed for it adds greatly to the interest of the reading and the critical analysis of the script. The students, the costumes, and the lighting must be studied to find their function in intensifying and vitalizing the mood and the characterizations of the play. The situation may take place in a different country and a different civilization. This means checking up on the history of the period, and the social life and customs of that time. Quite different, isn't it, from learning a list of dates and happenings of a time that seems dead and remote.

STUDENT: Yes, I'd like that better.

MISS MURPHY: Now through the living incidents of the play, the whole civilization comes to life; and so seems worth knowing about. To design settings and costumes, there must be a careful study of the architecture of the time, the typical furnishings and customs of the people.

STUDENT: Can the boys get these facts in the Encyclopedia?

MISS MURPHY: They can get the facts but not the spirit. The full information must be gathered, then carefully selected for the most appropriate and typical, and, finally, so intelligently organized that the student realizes the essentials of the situation, and through the settings and costumes he expresses the very essence of the Egyptian, the Persian, or the Modern, as the case may be.

Costumes, settings and lighting are more than mere trappings of the play. They give the audience a much easier and fuller transition to the situation than could otherwise be had.

If the French Revolution lives vividly for a boy through the play he is designing for, he will eagerly read more history in order to give these new adventures he has met a past and a future. If he discovers how he can change the whole mood of a scene by his light and colored gelatine screens, his physics laboratory will be a more fascinating place, for he finds there a practical opportunity for his study.

STUDENT: I would like physics experiments better if I could work with lights, trying different colors and effects with new angles.

MISS MURPHY: Yes, I think you would like it. How do you like elocution?

STUDENT: Not much. Do you have to take more of that?

MISS MURPHY: Well, the speech is not merely reading dull selections. You would like it because it is an important way of expressing character or of getting the play over to the audience. The boys enjoy then the routine of voice training and expressive speech. It has a new value and a new interest.

STUDENT: Have any of the fellows done anything with stage design after leaving school?

MISS MURPHY: Yes. Many of the boys in these classes have acted in and have directed plays given by their church societies or by clubs. Others have designed the settings and the costumes for similar amateur dramatics. They have enjoyed the experience and have raised the standard of performance in these plays. Some other students who became interested in the arts of the theatre through their art classes in high school later studied stage design professionally, some at Yale, some at other schools of the theatre. One is now the director of a Little Theatre, another is a scene designer in New York, while others have become interested in acting and are now professionals.

STUDENT: Could a boy make a small stage at home to experiment with?

MISS MURPHY: Yes. I recall now one of my former students who became interested in the theatre through his art class in high school. He has a Little Theatre Museum in his own small room. The models are carefully constructed from pieces of cardboard and paper ingeniously contrived to make marble columns, flights of steps or throne chairs. A typical scene in a play is represented in each of the half dozen models he has made. These are lighted carefully with Christmas tree bulbs and flashlights. The figures in these small acts are made of bits of wire and cloth, posed in expressive attitudes. He changes his theatre exhibits frequently, substituting new models for old ones as he becomes interested in new plays or in new ways of expressing the old. He can tell you all about the theatres of New York City; which have revolving stages and how they were used advantageously in recent plays; which plays have been well designed and lighted and which ones were commonplace.

STUDENT: That sounds interesting. I think I could do that. Are there any other things a fellow could do at home?

MISS MURPHY: Yes. Other boys I know have become interested in marionettes, those clever wooden actors who are just as powerful in their interpretation as is the mind of their creators, but no more so; just as expressive as their manipulators, but are lifeless and wooden if there is no creative imagination behind the scenes. Marionettes are fascinating as a hobby because they are comparatively inexpensive, yet offer such infinite possibilities. The character of the puppet or marionette is created through the expressive modelling of the head and the construction and costuming of the figure. The very limitation of utmost simplicity stimulates the imagination in creating the scenery and planning the lighting. Little plays and skits that will prove educational to the members and entertaining to others as well may be produced by even a small group.

STUDENT: Miss Murphy, do you think it better for students to buy the ready-made marionettes that are sold in some of the shops now or make their own?

MISS MURPHY: It is far better for the boys to create their own marionettes. There is the real joy of creation and the opportunity to express one's own ideas concretely. It is not so expensive and the making calls for ingenuity and gives a far greater de-

Scanned with CamScanner

gree of satisfaction when completed. In an ordinary classroom with no work-shop equipment at all, merely a couple of hammers, a saw, a borrowed vise and some wood, a group of our boys has constructed a very sturdy marionette stage used for their own experiments and to produce plays for the entertainment of their fellow students. They have worked out the electric wiring, constructed the switchboard and have given some very excellent programs. Dr. Low, our Principal at Erasmus Hall, has always given these students the greatest encouragement in their work. They watch eagerly for him in the audience. In fact, to tell you a secret, they are planning to put him in as one of the characters in their next play.

STUDENT: I surely want to see that play. Miss Murphy, would this course be any good for the boys who are going into business or maybe into the professions of, say, law or medicine?

MISS MURPHY: Oh, yes, though a few may develop professionally, stage design offers a clean, wholesome and fascinating hobby or avocation for any boy. From the serious statements of economists, it is evident the leisure time will be greatly increased in the very near future and the profitable use of this time will be of as much concern to everyone as the necessity of making a living. Marionettes may be made and operated by an individual for his own information and amusement, by a small club or by neighborhood friends, or by a large group coöperating.

The making of stage models or of marionettes gives a new zest to living, gives an incentive to further study and experimentation, develops intelligent thinking. In fact, it provides what is generally understood to be the basis for a real liberal education.

STUDENT: Will you tell me again, what you consider the special advantages of Stage Design as a high school course?

MISS MURPHY: To enumerate again the real values of stage design as a course in high school:

1. It raises the standard of appreciation of the various arts of the theatre through the understanding it gives. It developes in the student a more discriminating taste in the selection of his entertainment.

2. It provides a general purposeful education in art, history, science, speech, and so forth, by the breadth and integration of knowledge called for in the practical problems of stage designing.

3. It provides an opportunity for creative expression by furnishing an absorbing and worthy hobby with its many possible adaptations to particular interests and tastes.

4. It gives a stimulus to coöperative creative effort which in itself has real social value.

5. It provides an introduction to the arts of the theatre for those students who may wish to continue their studies professionally.

STUDENT: Thank you, Miss Murphy. I think I understand it better and I am going to watch for that play with Dr. Low as one of the marionettes.

MISS MURPHY: In conclusion, then, there is a place for everyone in such a course—for those who will always be audience, so they may enjoy plays and movies the more; for those who have the creative joy of taking part in plays, making stage models or marionettes as a hobby; and of course for those who may find the theatre absorbing enough to follow as a life profession.

MR. GRANT: We are now to consider the course in Commercial Design that is open to the boys of New York City. We have two high schools devoted wholly to Commercial Education for Boys; in Brooklyn, the Alexander Hamilton, over which Mr. Gilbert Raynor presides as Principal, and the High School of Commerce, in Manhattan, of which Dr. Edward J. McNamara is Principal.

Unfortunately, time does not permit hearing from both of these institutions at this time. The Art Department in each school has its individuality well marked. The aim of the instruction in both of these departments is to give the boys entering them a thorough understanding of Art that will benefit them in their future lives as business men. If they are talented and desire to follow commercial art as a vocation, then the aim is a sure art foundation on which to build.

I hope that there are many boys of our elementary and junior high schools who are listening in tonight because I am sure you are very fortunate in being able to have Mr. Raymond Carter, Head of the Art Department of the High School of Commerce, make clear to you the aim and scope of the Commercial Design courses open to the boys of New York City.

Mr. Carter, will you give us an idea of the course in Commercial Art that is given at the High School of Commerce?

MR. CARTER: Certainly, Mr. Grant. As you have already explained, the two high schools, Alexander Hamilton and the High School of Commerce, give a broad, general training to prepare lads for the world of business. The courses in Art are planned accordingly and have a distinctly commercial slant.

Our work in Art at the High School of Commerce is two-fold in its purpose:

First, we have a general course which all the lads are required to take. We make this as broad as possible and as practical as we can. During the first and second years of high school work we teach Art Appreciation, with emphasis on the performance of problems that bear directly upon their business training: projects in simple lettering, the planning of placards and advertisements, the effective use of color in display work, posters, package covers, a general study of the principles of design and

Scanned with CamScanner

its application to industry. We top this all during the second term of the second year with a rapid study of the History of the Fine Arts, Painting, Architecture and Sculpture and the application of Fine Art principles to the Art of the Marketplace—Industry and Advertising. We believe that the Art principles which govern the design of a piece of sculpture apply equally well to the designing of an automobile, a weighing machine or a modern building.

Our constant effort is to awaken in these embryo business men the realization of the importance of good Art in the manufacture of everyday articles, and in their advertising. This power of discrimination between the good and the bad in design, if impressed upon the younger generation, will be a powerful factor in making the great majority of Americans Art conscious.

So much for the required course. All boys take it—two periods a week for two years. They thrive upon it and enjoy it, and it is presented in an interesting, wide-awake way by a corps of enthusiastic instructors.

Now let us consider the cream of our work, our elective course in Commercial Art, which starts at the beginning of our second year and goes along for three years, right up to graduation, with one period of classroom work each day, five days a week, with required outside work to supplement the work in school.

This special course is open to talented pupils who have shown their aptitude during their first year of prescribed work, and it is also open to pupils who enter our second year directly from Junior High School with good records in Art.

Let me say right here, however, that we prefer to work with lads who come direct to us from 8B; then we can give them the benefit of our required work during their first year with us and fit them better to start the elective work in their second year.

This elective course delves into the various phases of Commercial Art rather intensively, to develop a foundation of technical skill for the field of advertising design. We also provide a basis for later and more diversified training in Art Schools. In fact, many of our boys attend evening classes in various Art schools in the City.

In order to give you a better close-up of the work we are trying to accomplish, we have brought along one of our lads, one who is in his last term of Elective Art and who will graduate in June. For the sake of brevity, I'll call him Bill.

First of all, will you tell us, Bill, why you decided to come to the High School of Commerce, almost four years ago?

BILL: Well, I've always been interested in drawing and I know several older fellows in the advertising field. Some of them got their start in the High School of Commerce and I acted on their advice when I graduated from P. S. 51, Manhattan, and made tracks for Commerce. I guess I was just like any other average kid

in my first year, managed to get by all right and went into the Elective Course in Art in my third term, that is, the beginning of my second year.

MR. CARTER: Can you remember what you took up first?

BILL: It seems a long time ago, but I'll try to remember. It was Design, the general principles of rhythm, balance, harmony, dominance and all the rest, especially as applied to borders, repeat patterns, dark and light in pictures, and the planning of various articles that were pleasing to the eye. I remember one design I had a lot of fun in making, a design for a radio cabinet.

MR. CARTER: Pretty good memory you have, Bill. Now what about your fourth term, the second term of your Elective work?

BILL: I was given freehand drawing, simple objects in outline and light and shade, all sorts of animal and plant forms, and all with the idea of rendering these objects in a commercial manner, that is, in a strong, simple way, so that they could be used in advertising design.

MR. CARTER: And what did you take up in the fifth term, the beginning of your second year in Elective Art?

BILL: A mighty tough course in lettering, covering the Classic Roman and the various modern alphabets derived from it. I had always been afraid of lettering before I found how very interesting it was and how much it is used by commercial designers.

By the end of the term I could handle several styles of lettering and had made quite a collection of examples of the various families of type used in printing, especially those most easy to read and best to use in advertising. I applied what I had learned in laying out posters and letterheads and for various other uses.

MR. CARTER: And what did you do all along to make this a matter of record? Did you save professional examples of work?

BILL: Oh yes, I started by using a desk drawer at home. I saved all sorts of clippings from papers and magazines and I carried a scratch pad in my pocket to jot down things that I saw and ideas that came to me. Before long, I picked up an old filing cabinet and classified my clippings in envelopes for easy reference. You never know, in advertising design, when you'll need a Sphinx or a polar bear or a good head of Lincoln or Napoleon. It pays to save 'em all.

MR. CARTER: What was your next step, in the sixth term?

BILL: I took up various techniques, pen and ink wash, and learned about drawing for reproduction. I clipped out the work of various commercial artists and studied their methods. I found out about line engravings, half-tones, rotogravure and lithography, the processes that an artist should understand if he wants his work to reproduce well.

MR. CARTER: And in the first term of your last year, your seventh term, what was the phase of Commercial Art that you took up?

Scanned with CamScanner

BILL: Work in color. I studied the various ways that colors produce effects, contrasting colors, color harmonies, and so on. We took small spotlights and made cross illuminations in colored lights and studied the effects. We applied these to the color-schemes for posters, booklet covers and book-jackets, and to covers for cartons and containers.

MR. CARTER: And now you're in the eighth term, your last term in the High School of Commerce. What are you studying now?

BILL: The eighth term work ties up everything that I've had so far. We go into the various applications of Commercial Art—counter displays, window displays, car advertising, outdoor posters, booklets, newspaper and magazine advertising, with the emphasis on visualization, that is, the creating of ideas.

There are about twenty-five of us in the class and each fellow has chosen a different article and is now working out a complete advertising campaign. We don't take articles already on the market; we invent our own—trademark names and all. One lad has invented a fictitious line of flavoring extracts, another has a new automobile tire. I've chosen as my subject a steamship line going to Mediterranean ports, and I'm now working out a complete campaign of advertising, folders, posters, booklets, newspaper and magazine advertisements and I'm surely kept busy looking up material. During the last weeks of the term I'll cut the plates for my booklet covers in linoleum, for one, two and three color printing and make prints on a hand-press, to get some practical knowledge of color printing.

MR. CARTER: What other work have you taken to supplement your Art training?

BILL: Last term I took a course in general advertising which is open to all lads in the upper classes, whether they have taken Elective Art or not. We studied typography, how to create ideas, how to write headlines and good copy, how to make attractive layouts for newspapers and magazines, and the various departments of advertising agency work; we also studied radio advertising.

It was great sport planning original radio programs, since every fellow had to write his own continuity and make the announcements before the class in the most approved manner. If you think it is easy to announce before a class and with an instructor who watches for every slip, try and do it!

MR. CARTER: Well, Bill, you've certainly given us a clear idea of what you've been through. Now just a word about the Art Service Squad in our school.

BILL: The Art Service is made up of a number of lads who meet every day during the last period to handle the publicity work of the school: posters advertising various activities, charts and graphs for various departments. I'ts just like an Art Service or an Advertising Agency in actual operation. Work is almost always done under pressure (everyone wants the stuff immediately), but the fellows get a great lot of practice.

Everything is done to help the fellows who go in for Art. Our principal, Dr. McNamara, has a warm spot in his heart for the Art work and all the fellows appreciate it and coöperate to the best of their ability.

MR. CARTER: Thank you, Bill! Bill's real name, by the way, is Leonard Putger.

We wish you success when you graduate in June. Don't expect too much at first in the way of a job. Our Placement Bureau at Commerce keeps in touch with the opportunities in the field of Advertising and so do all the members of the department. You're young and strong and ambitious; so keep on studying after you leave us and you'll go far. You realize that we've only been able to hit the high spots, but we've tried to impress upon you the fact that beauty is a vital factor in the creation of all articles that men buy and sell, and that the advertising of these articles must be done with taste and with good creative ideas back of them. We've tried to start you on your way to your ambition—to become a good commercial artist and an honest advertising man, in whatever capacity your future may lead you in the fields of commercial, industrial or graphic arts. It's a real privilege to know you and to work with you and with scores of others like you.

On your way, then, with our best wishes, and remember you are part of a profession that has the power to uplift public taste. Everyone sees the Art of the Marketplace; no one can avoid it. Help to make it better. You can do it.

ON WHAT BASIS SHALL WE SEGREGATE PUPILS IN ALGEBRA?

THE publication of a modified course in elementary algebra in the January number of HIGH POINTS brings to the fore again the need for making provision for the variation in the ability of our pupils in high school mathematics. Our theory of democracy in education has resolved itself today into one of offering equal opportunities to all rather than of giving the same work to all. However, this is still a theory. It is not necessary for the educational theorists to tell us what ought to be done for our weaker pupils. The proof of the pudding is in the eating. The classroom teachers know what must be done—the teachers who, throughout the country, are struggling with the heterogeneous groups in which ability ranges from the extremely bright pupil who can get along without a

Scanned with CamScanner

teacher to the one who cannot master even the simplest elements of the course of study.

The natural question that arises asks how the pupils are to be selected for whom the normal course is unsuited. The answer to this question is found in the studies by educators who have attempted to solve the problem. It is not sufficient for a teacher to express an opinion. One must depend upon those who have devoted a great deal of time to the problem.

To one who is acquainted with the literature on the subject it is ridiculous to see grouping in algebra based on an intelligence test. A number of studies have been made concerning the relationship between intelligence and achievement in algebra. A. R. Crathorne[1] reports a correlation of .50 between algebra marks and an average of two intelligence tests. B. R Buckingham[2] tells of a correlation of .38 between algebra ratings and the score on the Army Alpha Test. W. A. Proctor[3] reports a correlation of .46 between algebra marks and the Stanford Binet I. Q. E. L. Thorndike[4] . reports correlations ranging from .47 to .53 between the algebra part in his intelligence test for high school graduates and the whole examination. Fowler D. Brooks[5] reports eight correlations ranging from .34 to .54 between algebra marks and an intelligence test. Gertrude G. Todd[6] reports a correlation of .39 between marks in algebra and scores on the Terman Group Test of Mental Ability. In his own study the writer obtained a correlation of .54 between scores on the Otis Self-Administering Test and algebra marks at the end of one term.

While coefficients of correlation give a general picture of the relationship between intelligence and achievement in algebra, there is no doubt that they are far from satisfactory in giving full meaning to the situation that is being studied. The writer has found the following figures much more meaningful. Several terms ago he segregated the lowest twenty per cent and the highest twenty per cent of a group beginning the study of algebra on the basis of the Orleans Algebra Prognosis Test into separate classes for purposes of instruction. The marks recorded for the pupils at the end of the term justified the basis of segregation beyond a doubt. The range of I.Q.'s in the slow class was 71 to 123 and in the bright class 95 to 131. The mean I.Q.'s were 103.53 and 118.82 respectively. This being the case, it is much more important to study the records of individual pupils as they appear in the following table[7]:

I. Q.	Mark in Algebra	I. Q.	Mark in Algebra
108	65	116	65
118	65	116	65
110	90	116	70

102	55	105	45
107	20	109	40
100	50	104	55
107	50		

It seems that the chances of passing algebra in accordance with our present standards are few for those boys and girls whose I.Q. is below 90, and only slightly better for those whose I.Q. is between 90 and 100. However, if the I.Q. is to be used as the basis for barring pupils from the study of algebra or for segregating them into slow classes, how can the injustice be avoided in the cases of those pupils who evidently are able to do the work? And what should be done for those pupils with I.Q. between 100 and 110 who fail in algebra?

The question is constantly asked as to why prognosis of success in algebra cannot be based upon the child's preparation in arithmetic. In his study the writer assumes that the pupil's elementary school rating in arithmetic at the end of the eighth year is an index of his preparation in the subject. Each child is given a double rating in arithmetic, e.g., A A or A B or C B, etc., one for mechanical computation and the other for problems. The writer changed these ratings into numerical equivalents by assigning a value of 5 for an A, 4 for a B+, 3 for a B, 2 for a C and 1 for a D. A mark of A A was, therefore, equivalent to 10, B B+ to 7, etc. He then computed the coeffi-

Scanned with CamScanner

cients of correlation between these numerical equivalents and the teacher's marks in algebra at the end of the term and found them to be in four groups: .49, .48, .48, .33. The number of cases were 211, 54, 76, and 247, respectively.

It seemed possible that a different assignment of values to the literal ratings in arithmetic might have produced other coefficients of correlation. And so the distribution was made of the percentage of each combination of literal ratings that appeared in the group which contained 247 cases, and the $\frac{x}{sigma}$ values were computed from the table of areas of the normal probability curve in terms of the deviates from the mean. The correlation between these $\frac{x}{sigma}$ scores and the algebra marks at the end of the term was again found to be only .33.

A study of the records of individual pupils again brings out cases similar to those seen in the study of the I. Q.'s[8].

In his own study the writer included in his prognosis test several questions on arithmetic. He found a correlation of .27 between the scores on this arithmetic part and the marks in algebra at the end of the term. Since the scores on any arithmetic test based upon the content of the standard course of study represent a measure of the same abilities as the elementary school marks in arithmetic, it is fair to conclude that scores in an arithmetic test as a basis for grouping are as insufficient as the I. Q.

The purpose of this article is to state the case for a test of specific ability. C. L. Hull[9] distinguishes between tests that are designed to detect specific or particular aptitudes and those designed to detect general or average aptitudes. The former are exemplified by Patten's test for capacity to learn to operate the engine lathe or the Orleans-Solomon Latin Prognosis Test; the latter by the Stenquist Mechanical Aptitude Tests and also the numerous intelligence tests. In reality, these are essentially tests of general or average scholastic aptitude as contrasted with tests for specific scholastic aptitude, which are necessary in our present elective system. The use of a specific prognosis test in a particular subject is based upon the belief that we have a large number of more or less specialized potential aptitudes or intelligences. A general intelligence test could be nothing but a kind of average of all potential aptitudes for any given person. On the other hand, the work in a school subject is very specific. In Latin, for example, it is entirely verbal and involves no numerical or spatial elements, and the verbalness is of a particular kind with its own organization. Algebra, however, is chiefly numerical, but of a symbolic type which makes it different from the languages and even from geometry, which is spatial rather than numerical and which involves a different type of symbolism.

The prognosis tests used by the writer are ability tests in the sense that they measure the pupil's ability to do the type of work to be learned in the way in which it is to be learned. The pupil is given a little algebra in miniature, before he has received any instruction at all in the subject, and the purpose is to see if the pupil's success in a period of between eighty and ninety minutes will prognosticate success over a period of five months. An algebra test of this sort should take into account those factors that influence success in algebra achievement, namely, ability to handle algebra situations such as the pupil meets in the algebra class and mastery of such prerequisites as essentials of arithmetic and reading with comprehension.

What factors are involved in a pupil's ability to cope with algebraic situations? T. Percy Nunn[10] lists four important elements in the study of algebra as "analysis, the direct use of symbolism, the extended use of symbolism and the manipulation of symbolism". Concerning analysis he says, "A small boy has learnt that the area of a figure is the number of unit squares (say, square inches) which would entirely cover it. With this definition before him, he is asked to determine the area of a rectangle measuring seven inches by five. He soon observes that the unit squares into which the figure is mapped out can be regarded as forming five rows, each containing seven squares. This observation enables him to shorten the process of finding the area, or 35 square inches. So far arithmetic. But let the boy's attention shift from the actual manipulation of the figures to the process which the manipulation follows, and let him observe that the essence of that process is the multiplication of the length of the rectangle by the breadth. At this moment he has crossed the frontier which separates arithmetic from algebra; for it is an important part of the business of algebra to disengage the essential feature of an arithmetic process of given type from the numerical setting which a particular case presents." A great deal of the work done in the algebra class is of the sort described here, whether it be the translation of

[8] The names and records of these pupils are in the possession of the writer.

Scanned with CamScanner

phrases into algebraic shorthand or of word problems into algebraic equations. In order to do this, one must have a sufficient command of the necessary symbolism; and in order to grasp the various topics that make up the content of the algebra course, one must have a facility in manipulating the symbols.

In order to acquire the broader abilities which a study of algebra seeks to establish and to improve, the pupil must first master a number of details, some of which are (1) the notion that letters are used to represent numbers, (2) the substitution of numbers for letters, (3) the meaning and the use of the exponent, (4) the understanding and the use of directed numbers and (5) the translation into algebraic symbols of simple English phrases and statements. The writer's experience of twenty years in the teaching of algebra leads him to feel that an aptitude test of the sort used in this study should present the pupil with a larger number of simple abilities rather than a few broader ones to which he may not do justice in the few minutes allowed for each part of the test. If the pupil shows that he is able to master the tasks set because he has the abilities, the rest depends upon the learning process which, in turn, is closely linked with the method of presentation by the teacher. In order that these abilities may be discovered, the simplest thing seems to be to submit to the pupil some material in very elementary form which utilizes the learning process. For example, early in the year the teacher of algebra finds it necessary to teach his pupils the meaning of various English expressions needed in the solution of problems, such as "one number exceeds another", "the excess of one number over another", "the difference between two numbers", "one number is greater than another by a certain amount". He explains and illustrates the meanings of these terms and continues with a short effective drill. He also refers the class to the text-book and assigns the lesson to be done during the study period in school or at home. In doing the assignment the pupil goes through the same process again of studying an explanation and illustrations thereof and then working out some exercises based on them. A test composed of brief lessons and exercises following the same plan, therefore, is the instrument that calls for work most similar to that which the pupil will be expected to do throughout the year. The test used by the writer was of this sort[11]; and the records of individual pupils over a period of six years have proved that the test may be used without any hesitation in guiding pupils in the matter of the study of algebra.

If guidance is to be practiced with justice to the boys and girls concerned, then we must use that criterion which allows for the smallest percentage of error. There is no doubt in the minds of those who have devoted themselves to the problem that intelligence tests alone and arithmetic marks alone should not be used as a basis for ability grouping in algebra. To quote from an article by Professor Percival Symonds of Columbia University, who is one of the foremost leaders in the field:[12] "It may be of interest to learn that tests are now available which can be used as fairly accurate predictions of success in such subjects as algebra, geometry, Latin and modern languages. For prediction purposes in separate subjects these tests are more accurate than intelligence tests. Many teachers will wish to use these tests for guidance, for sectioning and for becoming acquainted early in the year with the pupil's capacity to learn particular subjects."

THE EDUCATIONAL VALUE OF THE FOREIGN LANGUAGE CLUB

Clubs as Aid in Language Teaching

The foreign language club is a well-established feature in foreign language teaching in schools of all grades offering such courses. Their educational value as a progressive auxiliary is recognized not only in the junior and senior high schools, but also in colleges and universities. Writers on the methodology of foreign language instruction approve such student organizations as a supplement to the work done in the classroom, and wherever schools have had experience with this extra-curricular activity, it has their pragmatic sanction.

Clubs as the Arena of Pupil Activity

At best, pupil activity, such a major educational desideratum according to best thought in this field, is narrowly circumscribed in the classroom by circumstances inherent in its formal nature. That this limitation increases in direct proportion to the size of the class is a common experience of all teachers. Especially is this true of any and all activity originating in pupil initiative. Neither time nor the demands of a set and fixed curriculum will allow experimental groping by pupils. If student initiative is to have a spontaneous character, there should be as little pulling of the strings behind the curtain by the teacher as possible. But in class the pupils and their work must be held very definitely to a prescribed course. This naturally makes for absolute teacher-direction in addition to supervision.

The club, however, is free from all

Scanned with CamScanner

these restrictions on genuine pupil initiative and activity. It is the natural arena where pupil activity may disport itself to the fullest extent. I use the word "disport" advisedly, because in this self-activity there should be real joy and pleasure for the student participants. With pupil self-expression as a direct reaction to the foreign language stimuli for the aim of the club, what a wide range for student activity it opens up! Anything, with no exception almost, related to the field of the foreign language studied is proper material for the club's program. Here is the place where individual differences can be given full rein, without any semblance of disorganization resulting. On the contrary, the variety will contribute richness and fullness to the work. There will be a healthful heterogeneity in which each personality can assert itself and develop.

Faculty Supervision

Under the supervision of a teacher who can guide without directing too insistently, such clubs must, of course, be. The *vision* in supervision of clubs cannot be overemphasized It presupposes an enthusiastic faculty leader with an inspiring personality, firmly convinced of the intrinsic value of the activity, who can envisage its ultimate significance and possibilities as training of growing personalities for and the introduction of young minds to a sphere of responsibilities and problems they will have to face in adult life, if they are to participate intelligently in human affairs.

Humanizing Language Study Through Clubs

Progressive educational thought on the objectives of foreign language study has gradually been promoting to a higher rank of importance the aim of fostering international understanding. The disciplinary purpose of language study and the learning of grammar for its own sake, both the educational heritage of centuries of formalized study of Latin, have been superseded by such objectives as stress the acquisition or development of skills useful in human relationships Comprehension of the spoken and written word, ability to speak and write in the foreign language—these became the goal of language learning. And most recently a new crystallization of this fourfold purpose, to reduce it to the proportions most feasible under prevailing school conditions, has moved to the front rank the ability to read the foreign language for comprehension and enjoyment.

If the tendencies revealed by these new objectives mean anything, they indicate that language study is being thought of more and more as a social force. From a cold, objective study of morphology and syntax, language learning is evolving into a subjective pursuit, a study of the human self as it is incarnated in other contemporary phases of human culture—civilizations called foreign, but not so alien as immigration laws would have us believe.

The new aim established for the average secondary-school course in a foreign modern language—to read for comprehension and enjoyment—marks even more definitely than heretofore the social character, with an international scope, of language study. While a student's ability to converse in or even understand the spoken foreign tongue at the end of the usual high school course is much too limited to function effectively for international sociality, a course based on the reading objective can give him a much wider cruising range in the realm of international understanding.

Therefore, now more than ever before in the history of foreign language teaching, the student club takes on real significance as an integral factor in the mechanism for imparting and absorbing instruction. Before there was a definite break between the class and the club. Each pursued a totally different activity, related only in name of the language. There actually was no correlation in what they were doing. Their purposes were not only dissimilar, but even mutually contradictory. The class considered the foreign language divorced from its human and even geographic setting; the club devoted its attention to the living people and its country. The human-interest activities of the club certainly did not develop in the student a taste for the kind of fare he was served in the class. On the other hand, it is logical to believe that the dull and dreary grammatical dissection which greeted the student at the very threshold of the new subject would make him suspicious of the club that bore the same name.

The new reading aim makes correlation possible and feasible. Class and club will now supplement each other. Language study can now be a harmonious whole. The reading aim will be served by the club which has always helped to arouse interest in and curiosity about the foreign people and its land. The class will make members for the club. By introducing the student to pleasurable reading the class will whet his appetite for more such information obtainable through membership in the club. This organization in turn will help to make the reading ability ever more desirable by revealing the greater and more genuine pleasures available only directly in the foreign language. The Club is thus an essential factor in humanizing the study of a foreign language.

The Mission of Language Teachers in a Changing World

In this age of ebb and flux, when nothing is certain and all established values and principles are being questioned, weighed in the balance and unceremoniously disestablished, our educational system is also undergoing close scrutiny. Due to the stringencies of the economic situation, it has even much more to fear from unreasoned and unreasoning retrenchment in the educational budget than from a scientific revaluation. The existing curriculum as a whole, as well as each individual subject, is now on the defensive. I venture to suggest that if the modern foreign languages find themselves today more exposed to attack than almost any other item in the

Scanned with CamScanner

curriculum, it is not because of their lack of intrinsic educational value, either absolute or relative, but rather a result of the teaching profession's failure to apply these subjects to the most vital service of which they are capable.

It should cause no surprise that the public is so willing to dispense with the luxury of grammar study. Even the cultural claims of each of the modern foreign languages, as factual as they undoubtedly are, can not match the crying need for economic relief. This is no time to insist that foreign literature can best be understood in the original language. Of what use is the availability of foreign literature when domestic food is out of the reach of the hungry?

The foreign language teacher must hitch his subject to economics in its broadest social significance. Foreign language teaching can and must be in the service of a great international effort to rebuild an economic world, now in ruins, in the spirit of understanding and justice between nation and nation. This new dedication of language teaching does not require any diminution of the cultural content of the instruction. It merely demands that the instruction in the publicly supported school systems should aim not merely at the cultivation of the individual's linguistic æsthetic sense, but at the preparation of the whole social groups speaking one language for a more just attitude toward social groups speaking other languages. Both teacher and pupil should be conscious of the great need of international society today—a more genuine mutual understanding — and of the fact that through their work in the foreign language they are contributing to this ideal. Such study should no longer represent a mere idle curiosity about exotic things abroad, a Cook's tour among strange scenery, but a purposeful seeking of a path to the heart and mind of other human beings, friendly and peaceful relations with whom are a prerequisite to economic reconstruction and enduring prosperity. Such instruction should build up a world social sense in the growing citizen, so that when he reaches the proper age he can be an intelligent force for international good in the civic life of his own country.

No one is as well equipped to give this essential educational service to society as the well prepared foreign language teacher. He is the logical interpreter between nations, who helps to build the bridge of understanding. To him it should be a labor of love. His training gives him an insight, possessed by few others, into the past and present of the foreign interlocutor with whom his pupils are attempting to establish communication. The foreign language teacher should look upon his calling as a mission of which the world has great need today. And for his own economic security he must convince the public, which supports education, that he is discharging this indispensable function. The public will then consider him indispensable.

The Rôle of the Language Club in this Mission

In spite of the democratic ideal of American education, the educated will probably always be a minority. Upon this enlightened remnant rests the hope for a finer humanity. It is this minority, whose numbers we may hope to increase slowly through the continued and cumulative effects of the education process, that we who teach must strive to imbue with this vision of the universality of human culture. They must be made not only to see, but also to feel, the unity of civilization and that the foreign cultures are but different aspects of the civilized way of life.

This basic minority can be given the special and extra attention it requires and deserves through the medium of the club. In the classroom it is not possible. The language club makes its appeal to the more interested and better students; to those to whom the study of a foreign language is a revelation of human values. The student who by joining the language club manifests his sympathetic comprehension of, or at least, a curiosity for, the cultures of another human group, is the precious raw material out of which the foreign language teacher is to produce the intelligent citizen of a world-wide human civilization. And the foreign language club is the indispensable instrument at the service of the teacher who thus visualizes the deeper purpose of his work. Viewed thus, the study of foreign languages is a vital element in education. Language teaching dedicated to such universal human needs as indicated above justifies its cost to the community.

Joshua Hochstein.
DeWitt Clinton High School.

UNEMPLOYED ALUMNI

Upon graduation alumni associations get busy and barrage the young graduates with a lot of second-class mail. "Join the Alumni"—"Support Your Alma Mater"—"Pay Your Dues"—"Come to the Dance" read the broadsides of the conscientious alumni secretary. The customary thing is to tear up the circular, shudder at the thought of returning to dear old Benedict Arnold High School (imagine returning after struggling four years to get out of it) and then ironically remark on how they dare to ask you for dues in such times as these! Those that do lend an ear to the secretary's pleadings are quite often the lucky ones with a job or those with a sweet memory of an extra-curricular activity in which their talents came to fruition or perhaps lonesome college freshmen yearning for the days when they were celebrities in their school life. Of course, if they now happen to be lawyers or insurance agents they will make it

Scanned with CamScanner

their business to join any fraternity which offers an opportunity of picking up "contacts" so necessary for their particular trade. This assortment of alumni is to be expected and welcomed. Their motives are inoffensive and pardonable. In the past very few alumni societies could have existed without their active financial support.

But our interest is not with the alumni who possess intelligence enough to recognize a graduate association as potentially beneficial to them; rather it is with the vast number of graduates who upon leaving high school are too preoccupied with the pressing problems of helping their parents and finding employment, to be at all concerned with patronizing an alumni association. Celebrities aside, what about the students who cannot afford college and who feel frustrated from the beginning, the mediocre who were kept in school against their wills and who are too ashamed to return as failures?

For them the future is indeed a bitter one. Those who go on studying in college or technical school have at least the tenuous hope of an improved future (four years ahead, presumably), but for the vast majority we eject with regularity twice a year, there remains only the sinking sensation of battling an economic storm with a paltry diploma; a storm, alas, wherein even the straws of hope are missing.

What chances have our alumni of justifying their schooling? Very little. Something might be said about the school's function in preparing the student for existing conditions by teaching Epictetus and primitive Christianity, but when it persists in a curriculum that dates from the Renaissance, with an alternate framework of science to prove its modernity and a smattering of a course in etiquette to show that it can compensate for the deficiencies of the home, well, the Lord help the young alumnus! His three years of French won't and his penetrations into the life cycle of the tiny animalcule will certainly not buttress him when the full meaning of unemployment overwhelms his person. No matter how valiantly the teacher may have labored to rid him of the success-ladder theory, we must confess that when the Great Awakening comes it will find the student's mind bloated with confessional magazines, moving picture glamor and sporting page wisecracks; shoddy safeguards in times such as these. The advertising expert, we are informed, has beaten the teacher at his own task. Whatever we have taught has been under duress and the revolting temper of the adolescent escapes, the moment discipline is relaxed, into the soggy sentiment of jazz melody and tabloid journalism. But to return to the problem in hand.

We will assume that the holy water of commencement has been sprinkled over the heads of the graduating class and that they awaken the next day none the worse for the experience and ready to assume their niche in the scheme of things. Times are bad, however, and tales about the depression have permeated the school building. Our alumni must not all expect to find jobs immediately. Even their parents become resigned to accepting them as useless freightage that must be carried along until things take a turn for the better.

But not all parents can easily resign themselves to seeing an offspring with a high school education of reputed value dawdle about the house, day after day, looking in mirrors, demanding money for the movies, playing the radio endlessly and insisting on being fed pretty often. There is bound to be some strong criticism about good-for-nothing children behaving like parasites. Such strictures often strike home. Youth is sensitive. What follows can readily be seen in the nation-wide increase of young vagrants the last two years. Where before Russia had her problem of homeless youth wandering across the country, her notorious *besprizionni*, we too must confess an identical problem but without the post-war chaos that extenuated the Russian situation. It is, then, this pressing need for sympathy and guidance which the demoralized home is not in a condition to offer, that must be met intelligently. It can only be through the school, we think, that home ties may be kept intact and the morale buoyed until the dark clouds begin to lift. We repeat the problem: What can the school do to cushion the blows upon the heads of its graduates? How can we help ballast their self-conscious souls to ride conditions more evenly?

It seems to us that the alumni association we described in our introductory paragraph could function more effectively. It is in a position to do something to bolster up the waning morale of our graduates and keep them from accepting a defeatist attitude towards life. There is a certain peace of mind in any union of fellow-sufferers thrown together by a common misfortune; each one strengthens the other by sublimating his miserable lot into that of the mass. Common suffering helps somewhat to reduce the melancholy of the unsuccessful job seeker. We see an example of that among the mushroom communities established by the homeless unemployed, the Hoovervilles and Prosperity Junctions. Graduating classes as a unit should therefore be encouraged to organize themselves into alumni groups, to band together for the purpose of meeting in the evening, within the school, to enjoy a variety of social and educational activities. Dances and theatricals could be arranged. Lectures on current problems might be instituted, provided the Board sees the way to include an appropriation therefor in its budget. The various extra-curricular clubs that now function with enthusiasm by day might have an evening branch for the alumni who participated during their under-graduate days. Teachers interested in their former pupils might volunteer to conduct clubs and arrange to chaperone dances and theatricals. An alumni fund for relieving extreme cases of distress could be started and contacts with social service agencies made through the school. What is needed

Scanned with CamScanner

is an alumni organizer, the grade advisers as a council or, better still, a person with courage and tact appointed by the principal to supervise the alumni. Permission from the Board of Education to use the building involves the expense of evening maintenance. With the coöperation of the custodian, this should not be very difficult to arrange.

JULIAN ARONSON.
Samuel J. Tilden High School.

SOCIAL EDUCATION IN THE NEW YORK CITY HIGH SCHOOL

1.

Social (character) education, a dominant problem in educational theory and practice today. We find:

Ten national organizations devoted to "character" study;

Thirty national publications dealing with the study of character and its development;

Character education included in the curricula of Los Angeles, Boston, Birmingham, Cleveland, Detroit, Salt Lake City, and others;

Spreading practice in large cities to have teacher committees at work in the field of character education;

Tendency to provide time allotments for character education in the school day;

Tendency to recognize desired character outcomes on school report cards.

2.

Why this growing interest in social (character) education? Apparently the interest echoes a social need. The normalcy of any community depends on the training of its young in "correct" social attitudes. The well-being of an individual has always depended on his manipulation of his powers of self-guidance, self-evaluation and his ability to adjust himself to his social environment. The human race has always recognized the importance of influencing the individual during his adolescence, at the time of the man-child's new birth, as Rousseau puts it.

3.

What has, up to recently, been the most decisive relation in human conduct, and, therefore, that most important in the training of the adolescent? The most decisive relation in human conduct has heretofore been that radiating from the family and localized in the home. Overshadowing the influence of the church and public gathering, the home has been the school where the young were introduced to and trained in the conduct of the mature.

How has the home, the traditional school for character and personality, fared with the passing of time? The trend of social and economic progress has been to dislocate the home, unfitting it as a school for "character" and "personality." This change was greatly accelerated during the post-war period. Contemporary industrial and social influences have played havoc with the daily household schedule, turning all awry the organization of the family and drawing, largely, the children out of the home. Parents are at a loss in maintaining their ascendancy, let alone the old-fashioned home ideals. This is especially evident in our local situation, where the heads of the household are in great number foreign born and where the "American" second generation refuses to recognize their elders' character and personality codes as their own.

If economics and social change have undermined the effectiveness of the home in preparing the adolescent for his rôle as a grown-up and vitiated for the greater part the influence of the community outside of the home, it is to the school, as the agency of social control that reaches most pre-adolescent and maturing young, that is left the job of preserving all the influences that are potential in the development of the socially commendable individual and of neutralizing all those factors in our contemporary life, such as dance halls, pool-rooms, movies, "art" magazines, side shows and tabloid dailies, that tend to destroy the ideals and standards of socially commendable behavior. At present it is no longer too temerarious to suggest that in certain communities — in our own, for example—progress has taken from the home and handed to the school an important social function—that of training the young in habits of personal development, giving them a standard code of "good" conduct, and, possibly, suggesting to them a basis of sex morality.

4.

How do our schools meet the situation? Discounting current criticism of the standard elementary and high school curriculum, we may say that our schools are at present organized to give direct instruction in health, citizenship, vocations, use of leisure time, and on the other hand, emphatically incidental instruction in the ideals and standards of socially correct conduct and personality. Contemporary educators, like Pringle, in his "Adolescence and High School Problems," warns that character is the outcome of the child's total experience and therefore the direction of this character outcome must not be more than a mere by-product of the ordinary school program. "The individual must win his social and moral inheritance if it is to be of value," argues Pringle. "The biological sciences teach the inevitable tragedies that result from lack of effort, and moral atrophy"—as a result of planned help by grown-ups—"is just as certain as physical loss of power." "The law of struggle is part of the law of evolution." And again Pringle, striking a Sunday note, says: "Christian people are wont to quote Paul—'Work out out your own salvation'!"

Now the plan of incidental social instruction is believed to work out passably well during the pre-adolescent period of the child's life. Pre-adoles-

Scanned with CamScanner

cence is comparatively naïve and unquestioning. During the first seven grades of his social life, the child's coming and going is closely accounted for both at the school and in the home. The curriculum is simpler and lends itself more readily as a character forming instrument. Because of physical immaturity the pre-adolescent faces small need of choice of activities, opinions and situations. In the lower grades, too, there are heard echoes of changing times. The following, quoting Dr. Maguire, is a typical opinion: "The traditional classroom (first eight grades) must give way to a classroom in which there are possible action situations of a special nature that will provide a setting for personality development and character growth."

Instruction for the character and personal development takes on a paramount significance when the growing human reaches the high school. This is the period when the youth "becomes suddenly conscious of being alive in a new significant sense, very different from the self-centered existence of his pre-adolescent days." Physical changes set in. The boy and girl reach out into manhood and womanhood. With increased physical maturity they face a greater degree of choice in conduct and opinion. Life is now more complex, because personal responsibility is greater. The youth understands neither his apparently changed surroundings nor his changed self. He gropes, perforce, for the whys and wherefores of behavior. If the high school machine, planned primarily to grind out the pre-college curriculum, does not offer him an interpretation of the relation of society and the individual, and does not attempt to clear up the peculiar perplexities that beset him, he finds it outside of the school, in the street, in the daily murder account or the current "social" and movie scandal, for, to paraphrase Pringle, it does seem to him the part of wisdom to lay direct hold on the thing desired when this is possible.

5.

How does the report of the Committee on Character Education of the High School Teachers' Association propose to deal with the problem? For one year the Committee on Character Education has been studying what was being done in regard to social education in the high schools of New York City. Its survey, carried on by means of questionnaires, takes into consideration four phases, or rather viewpoints, of character training:

1. Administration;
2. The curriculum;
3. Extra-curricular activities;
4. Procedure in subject and prefect class in relation to the character development and its effect on discipline.

Worthy of attention is the formulation, à la Pringle, of the replies to a questionnaire on how the pupils may be influenced in the direction of good habits, tastes and interests by the common high school subjects. The report ends with a list of sixteen definite recommendations, which may be recognized as the "morals" of the survey.

The H. S. T. A. report is important because it parallels tasks attempted in many parts of the country (see "Current Practice in Character Education in the Public Schools," by George H. Betts and George E. Hill, July 30, 1932, *School and Society*). It is important because it takes stock of what is being done—or what our schools wish to do—in regard to training the adolescent in what is popularly called character and personality. It is important because it dares to broach the dreaded question of character ratings.

On the other hand the report is guilty of two significant omissions. First, it slights almost wholly a primary pensum when it fails to take the opportunity to give publicity—for the benefit of our teachers—to the proposition that changing times have unfitted the home as a guide for maturing youth and placed the burden on the school. Secondly, it hesitates to consider (in connection with its discussion of the prefect period) the possibilities of a direct method of social education, that is, planned classroom instruction in the modalities of contemporary life, based on social phychology for adolescence, which, Pringle or no Pringle, may be best fitted to our local situation.

The approach presented by the report is merely a re-emphasis of the manner of social education common in our schools at present. Ethical conclusions are to be drawn from any fitting situation arising in the classroom. This approach is made to rest on the following desiderata:

1. The teacher must be vigilant as to his own personality and character. He must be an exemplar.
2. The teacher must be ready to lay hold of every suitable classroom situation and transform it into a setting for personality development and character growth. That is, instruction in good traits and commendable tastes and interests is immediately produced when made possible either by commission or omission.
3. The course of study in the usual high school subjects is to be planned so as to have training in good habits, interests and tastes as a dominant objective.

The workability of these articles of faith is posited on the adoption of the first three recommendations of the report:

1. Each teacher will have fewer pupils than at present and have a better opportunity to become individually acquainted with his pupils.
2. The syllabus in every subject will be amended so that more time is provided for character training.
3. Clerical work is to be reduced to a minimum so that a maximum of energy is left to the teacher for fuller and more character training.

When inspected in the light of our contemporary situation in the City of New York, these three keystone recommendations, on which the suggested method is based, appear commendable but rather playful wishes. Our high school population is growing fast, and will grow faster as the educational age limit climbs with the shrinking of

Scanned with CamScanner

the work day and work week in industries. However, the cardinal errors of the report are the following: First, it attempts to anchor a plan of character training and personal development to every aspect of school life, to the entire school program. Second, it fails to state in definite terms what the desired outcomes in the proposed plan should be.

Making a comprehensive demand on the life of the high school, it offers to complicate matters for the administration staff of the school, which is called on to change its policy and its routine to serve one central purpose, the creation of moral character and the grooming of personality. It proposes to slice time out of the subject class period, thus complicating the work of the teacher. It insists on the amendment of syllabi so as to shape every subject more closely as a tool for social training.

Thus says Pringle: "The high school pupils have been born into a social environment which is already largely determined, and this environment has among its elements certain standards of conduct to which they are expected to conform." Hence, the whole problem is to get the pupils to accept the moral world which awaits them and to adjust themselves to its demands. And to do this, the school must, according to Pringle and the committee report, reproduce as far as possible the condition of the best surrounding life. In the school "all the higher interests of humanity must be duplicated," a moral atmosphere instituted, and the individual and the group made to live "morals." That is, morality is to be inculcated by a sort of laboratory method, the school being the laboratory and the courses of study laboratory material.

It is extremely doubtful if the school —in view of the preponderating influence of the world outside of the school—can *fix* habitual modes of feeling, thinking and willing, that is, create the moral individual.

6.

What can we hope to do in the high schools? In general, we can, during his impressionable and troubled age, interpret for the adolescent those modes of conduct of the mature on which the welfare of the individual and society depends. This means that we shall emphasize ideas about morality (*mores*) rather than "moral" ideas. We shall not attempt to conjure up in the school a "moral atmosphere," but offer the adolescent a planned, factual course in social forms. In this course, by means of discussion somewhat less formal than that common in the usual class, the following problems will be considered among others:

1. The instinctive and emotional makeup of the individual.
2. Manners: enumeration and drill.
3. Health: importance, habits.
4. Dress.
5. The individual and the group. Honesty and dishonesty. "Good" conduct.
6. Parents and children.
7. The individual and the state.
8. Success in life. Planning one's activity.
9. Sex morality.

The home room period, instituted in some schools (as at the Lincoln High School), may be considered a step in the direction of a course of this description. At present the home room period is usually devoted to the discussion of topics picked at random by the pupils and the teacher. This discussion does not follow any definite plan. Being haphazard, it has no sound educational basis.

It is possible to organize for the whole term a succession of home room periods in accordance with a prepared course of study, rooting itself in social psychology for adolescence. (A simple and easily applicable outline is offered in Haddock's "Steps Upwards in Personality.")

7.

What are the objections to planned instruction in social forms for adolescents? Reference has already been made to Pringle. He, first, fashions a pseudo-Darwinian analogy between man's society and the jungle, stating (page 342, "High School Problems") that "moral standards are the result of a long race struggle." "Hence the individual must *win* his social and moral inheritance if it is to be of value." For "the law of work or struggle is a part of the law of evolution." And remember Pringle also quotes Paul: "Work out your salvation." All this to prove that no direct and carefully planned help and guidance may be proferred the adolescent in his perplexities, as he must, in line with inexorable biology and Saint Paul, work out his own salvation.

There is also the charge of indoctrination. The tabloid, the example of the unfit parent, the "true secret" magazine, the movie, also indoctrinate. Strange to say, the mentioned agencies treat the same topics that would be considered in a planned course in social forms.

The *Detroit Free Press* (July 1, 1930), doubts the intellectual fitness of most teachers to act as guides and mentors in such matters as character and personality. This opinion is very popular. It is understood that the teachers assuming the task of explaining conduct to the adolescent must be specially trained for the job. Indeed, certain teachers have special personal fitness for a duty of this kind. However, the use of a definite syllabus will lessen the effect of individual differences among the instructors.

8.

It is dangerous to base social training on literature. Note the tendency to relegate the presentation and discussion of the mentioned topics to English classes. Literature is too often full of unsound psychology and incorrectly documented social facts. Miss Haddock, for example bases each of her forty lessons on verse excerpts, mostly journalistic (Guest, Kiser, Henry Van Dyke, Walt Mason) and "inspirational." Much of it will appear rather naïve to the latter-day boy and girl of sixteen. This, too, we may recognize as an echo of the hankering to offer the adolescent "laboratory" conditions, a kind of recapitulation of "life."

Scanned with CamScanner

9.

What can be done immediately in the high school? If social instruction is permitted to remain haphazard and left to the incidental inspiration of teacher and pupil, let the school at least make definite for itself as to what should be recognized as the desired outcomes in character and personality.

This can be done through the formulation of brief and terse guides for the pupils and teachers. There is a lot of good in credos; they give shape to common preferences, make clear objectives, and offer, to a certain extent, a plan of action. Therefore, first, a code of desired outcomes in social education—for the teacher. Second, the popularization of a concise and simply stated code setting forth how, say, the Good Linconian is expected to conduct himself. (This would parallel Wm. J. Hutchins' plan, on which the Boston course is founded. Hutchins' motive is the Good American, who (1) tries to keep himself in perfect health, (2) controls himself, (3) is self-reliant, (4) is reliable, (5) plays fair, (6) does his duty, (7) tries to do the right thing in the right way, (8) works in friendly coöperation with his fellow-workers, (9) is kind, and (10) is loyal).

It is understood that the Good Linconian code will be furthered by club work, badges, and all forms of official recognition. I would have the students sing it out at assemblies. I would hang slogans in prominent places in the halls and classrooms, stating and reiterating essential portions of the Linconian code; for example, that Lincoln is a quiet school, that to be civilized is not to be noisy, that the typical Lincoln student is careful about his speech and dress.

Furthermore, we should recognize desired character outcomes by means of a rating or record. A mark emphasizes. It gives direction. To a certain extent, it is a socially useful reward.

These marks should be accorded to the superior pupil only, so that there is a permanent official record of outstanding worthwhile acts and tendencies but not of delinquencies. The ratings should express general and broad character traits, such as effort, reliability, self-control, service. Effort and service are my favorites. The first beckons encouragement to the less gifted; the second rewards the socially alert.

H. G. SHAPIRO.

Abraham Lincoln High School.

HIGH POINTS

What One Teacher Does With This Magazine

In the January, 1932, issue of HIGH POINTS there appeared an article entitled, "What One Principal Does With This Magazine." Dr. Tonsor's purpose in writing it was to point out to those teachers who never bother to read the publication, the fact that in nearly every issue are articles pertinent to the special interests of nearly all of them.

To emphasize this fact, the writer wishes to tell what *he* does with this magazine. He does not throw it unthumbed into a waste paper basket; he literally tears it to pieces. Before doing that, he glances through the table of contents and reads those articles which are of special interest to him as a teacher of English. (Nor has he found a single issue in the last five years which did not contain at least one article of particular significance to teachers of his subject.) These articles are then cut out and pasted in a loose-leaf scrapbook. This book of "High Points for the English Teacher," which the writer has been compiling for five years now, is a most valuable aid to him in teaching.

A glance at the titles of some of the articles in the book will perhaps indicate better than words its real value. For instance, it contains such subjects as:

"The Assignment in English at the John Adams High School"; "My Experiences with Creative Education"; "Thought and Fluency in the English Classroom in the Washington Irving High School"; "Developing the Inquiring Mind Through Reading and Thinking"; "Fads and Fancies of English Class 218"; "The Class Lexicographer"; "Creating the One-Act Play"; "Robin Hood"; "Summary of Experiments in Progress in the Department of English at the Julia Richman High School"; "Practical Projects for Slow Second Termers"; "The War Novel"; "Some Thoughts on Intellectual Curiosity and The Teaching of English"; "Plan for Teaching Short Story Writing"; "Old Ballads and Modern Tunes"; "Poetry in the Bake"; "English Book Reports"; "Method in the English Classroom"; "Vocabulary Study in English"; "The Library and English Teaching"; "Autobiography Has Vogue"; "A Socialized Oral English Lesson"; "Correlating English and Art."

Since the scrapbook is loose-leaf, these articles are classified and readily accessible. Therefore, when the writer is faced with the problem of teaching a text for the first time, he consults his book for suggestions as to approach and method. For example, to one who is beginning to teach *The Odyssey*, such articles as "A Project for the Odyssey" and "Teaching the Odyssey" (both of which appeared in the June, 1930, issue) should prove most stimulating.

Scanned with CamScanner

The writer cherishes the possibility that he may at some time in the dim, dark future, edit and publish this harvest of the fruits of the experience of so many of his colleagues; but if every teacher did "what one teacher does with this magazine," not a single copy of "High Points for the English Teacher" could ever be sold.

JESSE GRUMETTE.
Abraham Lincoln High School.

Talks to Teachers in the Department of Mathematics of the Abraham Lincoln High School

Teaching is an art founded primarily upon more or less basic fundamentals or scientific principles. The procedure to be employed in any of the infinite number of situations which may arise during the learning process, should be determined by reference to some basic principle or principles. A teacher should know not only *what* to do and *how* to do it, but also the *why* of the procedure. Self-criticism of the teaching act in the light of these fundamentals and appropriate modification as certain weaknesses or limitations appear, are essential to successful teaching.

It is the duty of the supervisor to help, aid, and assist the teachers under his immediate guidance in the study of their own procedure and personality.

With these facts in mind I feel that perhaps some service can be rendered by setting forth in brochure form a brief exposition of the major factors that contribute to success in teaching. It is not my aim to suggest new methods of teaching. I expect to hear the comment, "He is not telling us anything new. The best teachers have always followed out the suggestions herein contained." Very true. But if *all* teachers did the things that our "best teachers have always done," our teaching as a whole would be much improved.

If the supervisor and teacher are to secure a broad understanding of effective teaching procedure, rather than to agree upon one detailed procedure, self-criticism and evaluation of one's own work according to the general principles embodied in the talks will be most helpful.

No thought has been given to the order of importance of the topics; rather, they are chosen as the needs arise within our department.

I. PROFESSIONAL INTEREST AND GROWTH

It is no longer possible to master a body of facts and then expect to teach these same facts in the same way day after day, month after month, and year after year.

Changing social needs, new industrial demands, and new political views necessitated by the rapid and stupendous changes now taking place in our society demand constant readjustment. The function of the school, curricula, methods and content, and general devices are being continually modified to meet these needs.

The modern teacher must then be ever on the alert. The course in training taken during the "apprenticeship" period is wholly inadequate. The teacher must continue to be a student in the broad sense. What can a teacher do to maintain this student attitude?

1. Associate with individuals and affiliate with groups interested in solving professional problems.
2. Make use of methods and devices that others have proved valuable. Attempt to work out new methods or applications that may prove valuable to others.
3. Keep an open mind concerning new general movements in education. Deliberate and study intelligently appraisal of new ideas.

These are potent factors in stimulating one's own professional interest and growth.

The Teacher's Catechism:

(a) Do I strive continually to keep up-to-date and to improve by taking advantage of teacher's meetings, educational meetings, courses, travel, and the like?

(b) Do I willingly and gladly make use of methods that others have found valuable? What methods have I adopted recently? Do I keep abreast of the times in regard to testing the results of my work, diagnosis, and improvement?

(c) Do I become as fully informed as possible regarding new improvements in education? What professional book have I read the past year? What professional magazines am I reading?

Have you measured your professional interest and growth as others who view your work might measure it?

II. THE VOICE

Aside from the mastery of subject matter and the methods of teaching there are many personal traits which determine the quality and success of the teacher's work. One of these is the voice. Much has been written upon the relation of the human voice to certain desired responses both mental and physical, but due to differences in individuals it is extremely difficult to set down definite practices to be followed. However, it is generally agreed that the clearness, pitch quality and modulation of the human voice greatly affects emotional responses. The lawyer tempers the quality of his voice to suit his pleas to judge and jury; the orator modulates his voice to emphasize a special point of appeal to his audience; the attending nurse subdues her tones to soothe the sick patient; the businessman demands that his assistants exercise quiet, pleasing, well modulated voices. Innumerable instances could be cited where the voice is so important in everyday life; how much more important is a careful use of the voice in the classroom!

The teaching voice should be a good example for imitation and a voice well modulated in pitch and quality is an important factor in holding the attention of the pupils. Many teaching problems can be traced to the incorrect use of the voice. I strongly urge each teacher to analyze his classroom

Scanned with CamScanner

voice and invite the help of his supervisor in adjusting this important phase of teaching.

The Teacher's Catechism:

1. Is my teaching voice a good example for imitation?
2. Have I considered the quality of my voice in relation to the room in which I teach? Is my voice well modulated in tone, or is it loud, harsh, rasping, or fault-finding?
3. Do I strive to modulate my voice so that it will serve as an aid in holding the attention and interest of my pupils?
4. Is my teaching voice "natural" or "put on"?

A pleasing voice can be developed by almost any one who will give a little time and thought to its cultivation.

III. The Use of English

It is generally agreed that a pupil's facility in the use of English is gained largely through imitation and a constant use of an ever-increasing vocabulary. Notwithstanding, we frequently lose sight of the enormous influence of our own example in the classroom upon the pupils under guidance. To a very large extent the poor English used by our pupils is due to the carelessness on the part of some of our teachers in their own speech in the classroom and the failure to correct bad usage. Since suggestion and imitation play such an important rôle in educational theory and practice, it is therefore essential that the use of slang and slipshod speech should be carefully avoided.

The Teacher's Catechism:

1. Do I exercise care in the use of words and expressions.
2. Do I exercise care in the pronunciation and enunciation of words.
3. Do I use slang or ungrammatical expressions.
3. Do I have any defects of speech which might be imitated by the pupil's?
5. Do I use effective methods to secure the use of good English in the classroom.

Every teacher is a teacher of English.

Henry Shanholt,
Chairman, Mathematics Department.
Abraham Lincoln High School.

How Science Teachers Are Helping Other Teachers

At a recent meeting of General Science Chairmen, the question of cooperation between science departments and other departments came up for discussion. It was suggested that a study be made of this problem.

The following is a summary of the answers received from approximately fifty high school heads of science departments, in answer to a questionnaire concerning their contacts with chairmen of other departments. This outline indicates the various devices and methods employed by science departments in their endeavor to coöperate with other departments.

This summary may offer something of value to the science teacher who wishes to learn about the things that are being done by others in the matter of coöperation, with the emphasis on science department activities.

I. *English Department*

1. Insisting on the use of good English in all science classes.
2. Furnishing lists of words in science commonly misspelled.
3. Furnishing names of pupils who need assistance in either spoken or written English or both.
4. Assisting the English department with reference material for written reports.
5. Correcting essays for science content.
6. Suggesting the titles of books which have both scientific and literary merit.

II. *History Department*

1. Presenting information concerning "the scientific method and scientific attitude" before bodies of history teachers.
2. Lending science equipment for displays relating to economics, economic geography and history.
3. Coöperating in the constructing of syllabi to avoid duplication.
4. Furnishing bibliography of science material for use in history.
5. Checking of special history reports for scientific accuracy.

III. *Mathematics Department*

1. Furnishing lists of fundamental processes required in science classes.
2. Supplying lists of typical problems involving mathematical processes used in the science classes.
3. Listing common mathematical errors.
4. Making studies of pedagogical procedures of mathematical process.

IV. *Health Education Department*

1. Organizing special committees of teachers from the biology and health education departments for the purpose of exchanging opinions on such questions as equipment, syllabi, health diets, and health records.
2. Setting up exhibits of the applications of pure science; for example, X-Rays.

V. *Classical Languages*

1. Listing those words used in science having Latin derivations.

VI. *Music*

1. Lecturing on the physics of sound as applied to music.

VII. *Commercial Departments*

1. Training students in Office Practice.
2. Furnishing practice to students in taking dictation, in typewriting and mimeographing.
3. Building equipment for use of pupils; for example, a simple telephone system for instructional purposes.

VIII. *Art Department*

1. Furnishing opportunities to art students to make necessary charts and drawings.
2. Lecturing on the physics of color.

Scanned with CamScanner

3. Advising concerning mixing of colors, solvents for paints, and etching.

IX. *Mechanics Art Department*

1. Giving opportunities to vocational pupils to make small pieces of apparatus, and electrical equipment.

X. *Miscellaneous*

1. Some extra-curricular activities such as Mathematics, History, and Current Events groups have been enriched by talks given by science teachers.
2. Science teachers furnish technical information in the lighting arrangements for dramatic performances and the fireproofing of the scenery.
3. Small items of equipment are sometimes furnished.
4. Some science teachers make slides when needed, keep the lantern slide and motion picture machines in working order, and train pupils to take charge of this work.
5. A science teacher taught both English and science to the same group with creditable results.
6. The science department is saving about $50 per week by doing the printing for the school.
7. Science teachers keep radios in working order for educational purposes.

Significant Statements Taken from the Answers to the Questionnaire

1. "I have practically given him (a biology teacher) a seminar course of quiz and demonstration so that his knowledge is real and vivid," writes a general science chairman.
2. "If it isn't English, it isn't Chemistry."
3. "All written work is corrected for English phraseology, and notably inferior work is at once brought to the attention of the English chairman."
4. A biology chairman writes, "Anyone needing special advice about health matters consults the biology chairman or home nursing teachers."
5. A physical science chairman writes, "Scientific aspects of aviation were demonstrated before a class in English as part of a term project in that subject."
6. "The Stenography department gives us two stenographers each day, who cut our stencils and do the typing for the department."
7. "Once each year the three departments (physics, chemistry, and biology) put on a science program at one of the regular assemblies."
8. "Teachers of science visit classes of other departments."
9. "But truthfully I cannot say contact with any other department is marked enough to warrant mention."
10. "Whatever coöperation we have with other departments is incidental; that is, not deliberately sought. We borrow and lend cheerfully.

I think we rather rejoice in our self-sufficiency and independence. We consider that we can best perform our alloted tasks by sticking closely to our known duties."

11. A physical science chairman writes:

"The experiment carried out last term in the physical science department in coöperation with the English department proved of particular value to the school. At the suggestion of the chairman of English, I undertook to give a series of demonstrations designed to clarify and lend technical concreteness to the essays in Dr. Law's book, 'Science in Literature,' a text used with all English 5 pupils. These demonstrations covered the subjects of chlorine, atoms, electrons, and the incandescant lamp, paralleling closely the content of essays bearing similar titles in 'Science in Literature.' The spirit of the essays and the style requirements have likewise been observed."

The above outline has been presented for discussion once at a regular meeting of General Science chairmen and another time at a general faculty meeting of this school.

ALEXANDER BRODELL,
Chairman of the Science Department.
Franklin K. Lane High School.

Some Thoughts on the Control of a Student Aid Fund

The question of relief is far more pressing this year than it has been for some time past. It is common knowledge that unemployment has reached a critical peak. This economic pressure is causing a number of our pupils to leave school. Many others can and are managing to stay only at extreme sacrifice. The administrative assistants, deans, grade advisers, placement teachers and others are in a position to see the distressing conditions which prevail in the homes of many of our young people.

Practically every one of the high schools today maintains some kind of Student Aid Fund. This fund is generally managed by some one member of the faculty or by a small committee of the faculty. This is as it should be. It does not seem desirable to have the facts of every one or of any one of these appeals made public; hence, the smaller the group responsible for the management of this fund the less danger there is that the facts will be broadcast and the more completely this fund will be serving its purpose.

The manager of such a fund must be careful not to permit his heart to run away with his head. Frequently appeals are brought which appear very worthy and which, by telling narration, may move us to action. I would counsel a little caution. Let us remember that the person attempting to help others, when at the same time responsible for this fund, must be of a judicial temperament. We suggest,

Scanned with CamScanner

therefore, that all the evidence be gathered, that it be carefully weighed, and that then such assistance be given as is warranted by coldly analyzed facts. When the appeal comes in, therefore, the first thing to do is to communicate with any one of the existing social service agencies to determine, first, if they have a record of the case; second, if the case is now being assisted, and failing either one or both of the above, ask the agency to make an investigation to render a complete report. This procedure will have the effect, first, of avoiding hasty action; second, of checking frauds or others unworthy; third, of supplying adequate aid economically administered (this aid to come from the social service agency itself); and fourth, of giving that school help which may be necessary or sufficient.

In the interview with the pupil information must be obtained which will be needed for the social service agency. The following will always be useful:

First, name of each of the parents.

Second, name, age, and sex of each of the children of the family.

Third, address.

Fourth, father's occupation.

Fifth, mother's occupation.

Sixth, occupation of each of those children who is employed.

Seventh, whether or not each of them is now employed.

Eighth, the earnings brought into the home by each one.

Ninth, if any one of them is not now employed and how long he has been out of work.

Tenth, if there is illness, who is ill, the nature of the ailment, and for how long it has continued.

Last, such other pertinent information as your best judgment will dictate should be added to the above list.

If you have a placement office in your school, there should be a very close coöperation between it and the office trying to furnish relief. Very often the placement bureau can be very helpful by supplying afternoon or Saturday work to the young person in need.

One may not know where to turn to obtain the necessary information or help in handling any of the appeal cases. Our experience shows that the Jewish Social Service, the Catholic Charities, the Association for the Improvement of the Condition of the Poor—these three are most helpful. However, the Charity Organization Society annually publishes a directory which would give one all the information required. This directory is on the Board of Education supply list and should be in the office of every one of the high schools. In addition to this annual directory, the Charity Organization Society publishes a number of leaflets from time to time, each of which confines itself to some special phase of social service work. These leaflets sell at the nominal sum of ten cents a copy and very completely and fully supplement the main directory. There should also be available in each high school office for immediate emergency use a list of hospitals, clinics, and the like, that are found in the vicinity.

We should always try, in assisting our people, to avoid doing anything which smacks of charity. We must try always not to pauperize those who come to us. Such assistance as we give should be helpful and constructive. Assuming that the family is found to be worthy and that the best means of helping is through the school fund, at least one of the parents should then be invited to confer with the teacher in charge of the Student Aid Fund. It should be very carefully explained to the parent that the money being advanced is given as *a loan only* and that it is expected that this loan will be repaid. The parent should be requested to sign a promissory note agreeing to repay the amounts advanced in this manner. The time of repayment should purposely be left very indefinite. It should be explained, however, that the school expects the parent to repay just as soon as the family is financially able. The repayment need not be made in one lump sum. It can very well be made in small sums spread over a period of time, these sums being paid regularly either weekly or monthly.

These suggestions are meant to be helpful. They are based upon experience in handling Student Aid Fund going back seven years in the present school and more than five years in another one of the city high schools. We hope that the facts given in this brief review will serve some useful purpose.

SIMON J. JASON,
Administrative Assistant.
Walton High School.

The Preparation of Lantern Slides

In the search for suitable illustrative material, teachers often overlook a source that is rich in possibilities—the lantern slide. Most teachers are acquainted with the wonderful collection at the Museum of Natural History that may be borrowed on application. These slides cover a wide variety of topics and have been of great assistance to the pupils and teachers in the public schools. Many teachers are not aware of another interesting and valuable source of slides, those that they can make.

The preparation of lantern slides is surprisingly easy. The truth of this statement will be realized from the following descriptions of the various types that can be made.

Using a crow quill pen and India ink it is possible to draw or write directly on glass. The drawing or writing is done on glass plates made especially for lantern slides. These plates and all other materials used are on the Board of Education supply list. Teachers who prefer to use their own materials may purchase them very reasonably at photographic supply or department stores. This type of slide is useful for the drawing of maps in history, pieces of apparatus in science, word study in English and for a large variety of uses. After the ink on the slide has dried, a lantern slide mat is placed on it and it is then covered with a lantern slide cover glass. Using a piece of lantern slide tape the two glass plates are bound together, a thumb mark is pasted to

Scanned with CamScanner

the lower left corner and the slide is ready for use.

A second type of slide that is superior to the one just described is made by drawing or writing on cellophane with India ink. Enough cellophane to make many slides may be purchased for ten cents. The cellophane is cut to make pieces the same size as the lantern slide, three and one-quarter by four inches. The drawing or tracing is put on the cellophane and allowed to dry. When dry, a lantern slide mat is placed over it and both are placed between two cover-glass plates. The slide is bound with lantern slide tape and thumb marked.

Typewritten slides are readily prepared by using cellophane. A piece of carbon paper twice the size of the slide, six and one-half inches by four, is folded over both sides of the cellophane, carbon side in. This is then placed in the typewriter and the statement is typed, using a heavy touch. When completed, the cellophane is removed, covered with a mat, placed between cover glasses and bound. This typewritten slide has many uses. It may be used for explanations of pictures in a series, for drill questions, test questions, instructions and regulations, word study and problems. If desired, a drawing and typewritten work may be placed on the same slide. By the use of colored cellophane, poster effects may be produced. This last use might be extended to serve as a project for pupils gifted in drawing.

More interesting to the writer were slides prepared from photographs taken by himself of places visited. For example, a useful and instructive set of slides was made from pictures taken on a transcontinental automobile trip last summer. Pictures taken in National Parks, pictures of mines, factories, oil fields, giant trees and desert plant life produced a set of slides that can be used as supplementary and illustrative material for classroom or auditorium.

The possibilities of use for this type of slide are unlimited. Each picture is backed by the personal experience of the teacher and each scene has a special significance. Teachers of foreign languages could use this means to describe to their classes visits they have made to foreign countries. These slides have the advantage that they are the permanent property of the teacher. It is not necessary to return them to the Museum after each showing and to request them again for the next term.

These photographic lantern slides are easily made if a few simple precautions are followed. Any negative that produces a good picture may be used to make a lantern slide. The negative, or film, of the picture that is to be printed on the slide is placed, shiny side down, in a photographic printing frame. On this is placed the sensitive photographic slide. The back of the frame is now fastened in place by the convenient clips with which it is equipped, and the slide is ready for exposure. The procedure up to this point must be done in a darkroom. A red light is the only

illumination that may be used. This requirement should prove to be no obstacle in a high school. The Chemistry Departments in most of our high schools have photographic darkrooms that the teachers can undoubtedly arrange to use. These rooms are usually equipped with special lighting facilities that make the work easy.

To transfer the picture to the slide, the photographic frame prepared as described is exposed for about six seconds to the light of a twenty-five watt lamp at a distance of six feet. It may also be exposed by holding a lighted match at an arm's length from the frame for ten seconds. After exposing the slide, all lights except the red one are extinguished and the slide is ready for development. It is removed from the printing frame and immersed in a developing solution for three minutes. It is then removed and rinsed in cold water for five seconds. After rinsing, it is placed in a fixing bath for about seven minutes. The slide is then washed in running water for fifteen minutes and dried. When dry, a mat is placed over the dull side of the slide. This is covered with a glass covered plate, bound and thumb-marked as described above.

The Eastman Kodak Company publishes two booklets that are of considerable assistance in making slides. The titles are, "Lantern Slides, How to Make and Color Them" and "Elementary Photographic Chemistry." Both books will be sent to teachers on request.

For those who are interested, but who feel that the instructions given here and in the booklets are inadequate, a practical suggestion may be made. Select a course in Visual Instruction to satisfy the alertness requirement. The Museum of Natural History offers an excellent course free to teachers. Many of the local colleges also offer courses of this type.

Teachers who enjoy traveling or "hunting" with a camera will, if they try the above suggestions, find an unlimited field of activity open to them. This use of photography offers not only a fascinating hobby, but, in addition, a practical source of satisfactory and worth-while illustrative material.

LEONARD J. FLIEDNER
George Washington High School.

How to Operate the Projection Lantern Efficiently

Let us take a trip through a projection lantern and see its parts and their relation to each other. We enter through the back door. It opens upwards. The first thing we see is the reflector, which is generally fastened to the receptacle holding the bulb, called the socket. The purpose of the reflector is to take the light from the back of the filament of the bulb and reflect it forward, thus adding to the useful light given off by the filament. Upon observing the filament of the bulb (the filament being the thin wires inside the bulb which produce the light by virtue of being heated to incandescence by the electric current), we note the filament consists of wire springs that lie in a plane. The bulb must be so placed that the plane of

Scanned with CamScanner

this filament is parallel to the condensing lens in front of the bulb. The socket may be raised or lowered so that the filament may be centrally located with respect to the condensing lens, by loosening a screw below the lantern holding the socket to the floor of the lamp house. If the bulb is prefocused it is unnecessary to adjust the filament with respect to height. Note that this floor will slide back and forth if we loosen a small cam-lever generally located on the outside of the floor below the lamp house. This enables us to move the bulk back and forth and set the filament at such a point that will give maximum brightness upon the screen. This is very important, especially after inserting a new bulb. When inserting a new bulb, the entire floor is removed by sliding it out through the back of the lamp house. The bulb is now inserted, the plane of the filament noted and placed at right angles to the axis of projection. Then, when the floor is replaced and moved back and forth, one observes that in the extreme positions the screen is not as bright as in some intermediate one. This in-between position gives maximum efficiency, for it places the filament on the focus of the condensing lens. The floor is fixed in this position by tightening the cam-lever under the lamp house.

As we go through the condensing lenses we notice that they become dusty very easily since they are ventilated. The cover on top of the lens box can be opened by first loosening the thumb screw and then swinging it open, for it has a hinge on the side opposite the locking screw. Lift out the two lenses and wipe them with a soft cloth. It is gratifying to note the improvement of the light upon the screen after cleaning the condensing lens. Never hold a lens by its surface; always grasp the edge, since fingerprints cut off light. Next, we go through the slide carrier, bellows, and projection lens. These give very little trouble. If the slide carrier is not centrally located, however, the full slide will not be shown upon the screen. The projection lens consists of a number of lenses mounted in a barrel. They should not be taken apart, since the inside is dust proof. The outer surfaces of the front and rear lenses should be wiped clean with a soft cloth.

In using the lantern it must be remembered that the smaller the picture, the greater its brightness. A plaster wall is the best screen. In setting up the lantern the following method is best:

1. Adjust the slide carrier so that it is centrally located.
2. Place the projection lens half way out.
3. Pull out the bellows and tighten set screws, so that the front of the lantern is rigid.
4. Make final adjustment with the projection lens, to give a sharp picture.
5. When changing slides turn off the light, or intercept the rays during the change. This will lessen eye strain.

The teacher can make his own slides by tracing or drawing any picture on a thin sheet of cellophane and placing it between two pieces of thin glass, measuring 3¼ by 4 inches. When this is completed bind the edges with tape. One may typewrite on cellophane by placing a piece of carbon paper on both sides of the cellophane and typewriting upon it. This is ideal for projecting songs and other written material. It is possible to write on glass if the glass is first painted with a solution of gelatin and water. A piece of ground glass makes a good slide by drawing upon it with a medium-soft pencil. The drawing can be erased, if desired, with Bon Ami and water.

In using visual aids we must have everything ready and know just what to do; and then do it with the least possible interruption. Therefore, the teacher should know how the apparatus works and how to keep it working.

BERTHOLD A. SPEIER.
Brooklyn Technical High School.

The School Health Council

On June 22, 1931, Deputy Superintendent Campbell requested all high school principals to organize a Health Council which was to start functioning with the September, 1931, term. As a basis of organization, Dr. Campbell enclosed an outline of the purpose, personnel, and functions of the Health Council as prepared by a committee of high school teachers under the direction of Dr. A. P. Way and Dr. I. H. Goldberger, assistant directors of Health Education.

On April 25, 1932, Deputy and Associate Superintendent Campbell requested the principals of high schools to report, through a questionnaire, the progress and value of the School Health Council project, which had been in operation since September, 1931. Dr. A. K. Aldinger, the Director of Health Education, in the issue of HIGH POINTS for December, 1932, reported on the tabulated replies submitted.

In the desire to show how essential Health Councils are in large city schools and perhaps to bring about an even greater interest and maximum efficiency, the writer presents his views on the subject.

The successful execution of even a practical school health program will require the warm support and the conscientious effort of the entire school faculty, the supervisory staff and the administrative staff. The high schools of today are organizations of highly-trained specialists and unless the principal assigns some responsible person to act as the contact man between these specialists, neither harmony nor the optimal health of the children can be achieved. This contact man is the keystone in the arch; and just as the arch will give way if it gets no support, so will he, if he does not enjoy the enthusiastic support of all.

Fully realizing that to carry out this program is not a one-man job, the writer proposes to make this contact man the chairman of a school health

Scanned with CamScanner

committee. This committee is to consist of the following:

1. Principal.
2. Administrative Assistant.
3. Custodian-Engineer.
4. Dean.
5. Chairman of the Department of Health Education.
6. Psychiatrist.
7. School Doctor.
8. School Nurse.
9. Vocational Counselor.
10. Social Case Worker.
11. Slight Conversation Adviser-Refractionist.
12. Dental Adviser.
13. All teachers of Health Education.
14. Other teachers who may wish to become members.
15. Representatives of the Parents-Teachers Association.
16. School Health President elected by the entire student body.

Under the leadership of the Health Committee the writer suggests the following plan of organization and administration of the school health program:

A. *Organization* (six possible plans).

The position of contact man should be taken by one of these:

1. The Principal who acts as an ex-officio member of the health committee, either acting or assigning a teacher-member to do so.
2. An Administrative Assistant.
3. The Dean of Boys or the Dean of Girls.
4. The Psychiatrist or School Doctor or School Nurse.
5. The Chairman or a teacher of the Department of Health Education.
6. The Custodian-Engineer.

B. *Administration:*

1. The Health Committee Chairman (contact man) is to call at least two committee meetings before the new school health program is instituted.
2. Meetings are to be called weekly thereafter unless circumstances require more.
3. A special Health Bulletin Board for teachers is to be put up in the General Office. All duties, assignments and posts are to be posted on it ahead of time.
4. All special duties and plans are to be distributed with an attached receipt for teachers to return to the "Health Box" in the General Office.
5. All projects, plans and accomplishments are to be posted on the three Health Bulletin Boards of each floor. All pupils or others may post questions, requests for advice or suggestions on health. These will be considered at the weekly meetings of the committee and the answers, if any, will be posted.
6. A weekly newspaper, "Health News," is to be published and distributed to all.

C. *Aims of Committee Work* (in part):

1. To make pupils, teachers and other employees of the school and parents health conscious.
2. To secure for all concerned the school environment most conducive to optimal health.
3. To better, if possible, the home conditions and environment so necessary for optimal health.
4. To obtain a complete health examination for all pupils, teachers, and other employees of the school.
5. To interpret the meaning of the results found in the examination.
6. To secure needed remedial measures for all.
7. To provide health knowledge from a positive viewpoint.
8. To inculcate right health habits that will endure.
9. To develop proper attitudes of health.
10. To secure as near to 100 per cent attendance as possible by a weekly check-up on all absences, classifying their causes and eliminating them as early as possible.

D. *Assignment of Committee Work to be Evenly Distributed:*

1. Each committee member is to be responsible for a particular phase in the program, such as heating, lighting, publicity, etc.
2. Student committees and class health leaders are to assist each health manager of the floor.

E. *Contacts:*

1. Between Health Committees and Class teachers:
   a. Floor manager.
   b. Bulletin boards.
   c. General conference.
   d. Special meeting (lecture by authorities).
   e. Consultation periods.
2. Between Health Committee and pupils:
   a. Bulletin boards.
   b. Weekly health newspaper.
   c. Class Health President. (Council of Presidents to meet monthly under the direction of the School Health President.)
   d. Health shows at weekly assemblies.
   e. Teacher is to serve as contact man between the Health Committee and the class.
3. Between Health Committee and other employees of the school:
   a. Committee member assignments (see section "D" above).
4. Between Health Committee and Parents:
   a. Parents-Teachers Association representative as a member of the committee.
   b. "Health News" sent to parents through the pupils.
   c. Demonstrations for the parents to be held at frequent intervals.

Scanned with CamScanner

d. Progress of the children's health to be reported to parents from time to time.

5. Between Health Committee and Community:
   a. Progress of the school program is to be published in the community paper and magazines.
   b. A standing invitation is to be extended to all community residents.
   c. Prominent leaders of the community are to be invited to speak before school assemblies and before Parents-Teachers Association meetings.
6. Between Health Committee and Those Interested Outside of the Community:
   a. All requests and inquiries are to be given the required attention at the earliest possible time.
   b. A standing invitation is to be extended to those interested in the workings of the committee.

M. DONALD ADOLPH.
Thomas Jefferson High School.

A Method of Presenting Cultural Material

The objectives of modern language study are not limited to the study of language and literature. The development of an interest in the civilization of the foreign people is recognized as our third objective.

1. In common practice, the encouragement of the cultural enthusiasm is a by-product of the actual study of the language. That is, an attempt is made to give the adolescent student a knowledge and an appreciation of the foreign people through reading selections referring to customs, through literature stressing regional life and at times through special history and cultural readers. This method is haphazard. Its aim is usually defeated and forgotten in the struggle with the difficulties of the language. At best, the pupil is left with a hazy idea of the life and culture of the people whose language is studied. Often the impressions thus received are basically false, being twisted by the exigencies of the typical story book or grammar book situation.

2. The imperfection of the method that hopes to give pupil knowledge and appreciation of a civilization only through the actual study of the foreign language and literature is recognized in the fact that the average modern language syllabus provides for the presentation, in the vernacular (English), of factual material that will orient the student in foreign culture.

The manner of presenting this material is, in accordance with a comfortably seated tradition, always schematic, logical. Culture is sliced into component sections: history, geography, industry, customs and so on. These sections are in turn cut into grades meant to conform to a putative scale of difficulty of understanding. So that during his first term of Spanish, the pupil's sympathy to take in the ideals and aspirations and traditions of Spaniards and Spanish Americans is to be enlarged by having him swallow the following bits of history, and the following dribbles of geography, and the following customs. During the second term, however, he is to be made to imbibe that much history, so much geography and such assorted customs.

The entire schema, as all diagrammatic creations, is easy on the schemer, but meaningless and unnatural to the learner.

3. The method of presentation set forth in the outline found below aims to suit the attitude and interests of the learner.

Its approach is not logical, but psychological. Instead of being schematic, it is topical. And instead of amputating a foreign civilization into correct categories, it leans on the practice of "co-centric" repetition in each term of important factual details.

(a) The Outline of German Civilization for the First Three Terms is made up of three series of coördinated topics. Each topic is presented as a lesson, in which the canonized divisions of geography, history, customs, and so forth, meet in natural unity, say, the kind of unity all these "categories" will find in a social discussion or in a newspaper article. (After motivating the topic for the class, the teacher refers the pupils to encyclopedias, books of reference and to the guidance of the school reference librarian or to the neighborhood public library. Reports by pupils may be either written or oral. They may be replaced by general class discussion guided by the teacher. Prints, picture postcards and photographs are circulated whenever the lesson calls for visual illustration.)

(b) The topics follow each other in an order of coherence that takes into consideration the interest of the learner. The most important factual details considered in the series for the first term are repeated (from a slightly different viewpoint) in the second term, and, if the need of completing the student's understanding of contemporary German civilization requires further repetition, also in the third term series.

(c) The three series of topics thus combine in an inclusive whole, the Understanding of the Civilization of the German People. The presentation moves along two basic lines of direction; from the near to the distant, from the present to the past.

German One

1. The German language. Related languages. Relation to English; cognates.
2. Where German is spoken; geography and brief description of Germany, Austria and Switzerland.
3. How Germany was made. Brief historic review (include Austria). Minimum of two lessons.
4. Regions of Germany, Bavaria, Saxony, Prussia, Rhineland, Silesia, Baltic Coast, East Prussia, Austria. Two lessons.
5. German childhood. Lower schools. Toys. Games.

Scanned with CamScanner

6. Vacation days of German youth. Wandervögel. Secondary schools.
7. Sports and amusements. Interest in athletics; public stadia. Outstanding performers.
8. The German home. Recent changes. Typical architecture. Furnishings.
9. German holidays: traditional, religious, national.
10. Social attitudes and polite usage. Expressions used in social intercourse. Dramatize.
11. Important German critics. Points of interest. Berlin, Vienna, Munich, Dresden, Hamburg, Cologne, Koenigsberg, Leipzig, Frankfurt, Bremen.
12. Great Germans. Goethe, Shiller, Frederick the Great, Luther, Charlemagne, Barbarossa, Einstein, Bismarck, Lessing, Heine, Beethoven, Roentgen.

German Two

1. Review topics 2 and 4 of German One outline.
2. Berlin. Map. Important streets. Public buildings and parks. Imperial castle. Potsdam. Sans Souci. Templehof.
3. Vienna, Prater. Dom of St. Stephen. Schonbrunn. Burg Theater. University. Museum.
4. Munich. Castle. Cathedral. Germanic Museum.
5. Dresden. Picture Galleries.
6. Leipzig. Book trade and famous publishers. Auerbachskeller Messe (fur) fairs.
7. Hamburg. Bremen. Lübeck. Harbors. Rathaus.
8. Danzig and East Prussia. Harbor, Gdynia, Polish Hinterland.
9. Rhineland. Frankfurt. Cologne. Essen. Ruhr region.
10. German schools and universities.
11. German industries: chemical, steel and iron, electrical.
12. German scientists.
13. German musicians: Bach, Beethoven, Wagner, Brahms, Mozart.
14. German literature: Goethe, Schiller, Heine.

German Three

1. German "Götterwelt." Nibelungenlied.
2. Life and habits of ancient Germans. Arminius and Varus. Tacitus' account of ancient Germans.
3. Franks and Charlemagne.
4. Middle Ages. Barbarossa. Rothenburg.
5. Nürnberg. Albrecht Dürer. Hans Sachs. Meistersinger.
6. Luther.
7. Frederick the Great.
8. Germany and Napoleon.
9. Bismarck.
10. World War.
11. German Republic. Rathenau, von Hindenburg, Hitler, Einstein.
12. Contemporary literature: names.
13. Contemporary music: names. Contemporary science: names.
14. List of German periodicals and newspapers.
15. Germans in the United States.

Abraham Lincoln High School.

Chemical Names Commonly Mispronounced

It is obviously essential that teachers, in general, use good English and pronounce words correctly. With the different types of training for teachers of diverse subjects, there are varying degrees of attainment of this essential. I believe that we would all agree that it is possible and desirable, however, that each teacher should be able to pronounce the words common to his subject in accordance with accepted standards. With this in mind, the writer made a study of words common to the field of Elementary Chemistry.

The following list consists of words and names of scientists which the writer has found to be mispronounced most often. This mispronunciation may consist of the wrong pronunciation of part of the word or an accentuation of the wrong syllable. The authorities consulted were Funk and Wagnalls' Practical Standard Dictionary and Webster's New Standard Dictionary. This list is not intended to be all-comprehensive, but it is hoped that a careful study will lead to an awareness of possible deficiencies that may exist in this particular essential.

As a general rule, for words ending in *-ation*, the primary accent is always on the "a" before the "tion." For example, the word "concentration" is pronounced: kon″sen-tray′-shun. Similarly with such words as condensation, demonstration, distillation, evaporation, hydrogenation, oxidation, titration, and so forth.

Where two pronunciations are given, the most acceptable one is given first. The symbols used in dictionaries to indicate pronunciation have been omitted. For purposes of simplification, each word is respelled in phonetic fashion. The principal accent is indicated by (′) and the secondary accent by (″).

Word	*Pronunciation*
acidimetric	as″i-di-met′rik
acidimetry	as″i-dim′e-tri
aerate	ai′er-ate (*ai* as in "laid")
alkalimetric	al″ka-li-met′rik

The Organization of the Chemistry Laboratory Work at the John Adams High School

This article is an outline of the organization of the laboratory work in chemistry, adopted at the John Adams High School a year ago and followed closely with all classes. It has been found that under the plan to be described, laboratory procedures have been materially simplified, preliminary manipulations reduced to a minimum, and teacher-supervision made more effective.

This plan was suggested by the writer and was developed under the sympathetic guidance of Mr. Alexander Efron, chairman of the Physical Science department. The coöperation of all teachers was next enlisted, thereby assuring the success of the plan.

The basis of the plan is the physical equipment of the laboratory. In this room there are nine work tables, each having four positions at which students carry on their experiments. Each table is numbered, the numbers running from one to nine. The in-

Scanned with CamScanner

dividual working positions are designated by letters A, B, C, D, following the respective table number. Thus, for example, we speak of position 6-A or 6-B and find both teacher and pupil distinctly aware of the exact location denoted by the symbol.

Adjacent to the Laboratory is the Preparation Room in which there is a large operation table. On this table there are nine spaces marked off for nine trays. Both spaces and trays are numbered to correspond with the nine laboratory tables. On the shelves of the preparation room there have been prepared sets of nine bottles of chemicals required at some time during the term. These bottles are of four and six ounce capacity, with waterproofed labels on which appear the names of the chemicals and a Table number. In addition to this the bottles have colored necks to designate acids, bases, dry chemicals and neutral liquids. This has proved to be a valuable aid to students as it fixes in their mind that acids turn litmus red and bases turn litmus blue. Moreover, a bottle with a colored neck can be readily located if it goes astray.

The functioning of the organization starts automatically with the entrance of the student into the laboratory, which is clear of all chemicals and apparatus. He goes directly to his assigned position so that the attendance may be taken as soon as the bell rings. This is followed by a class discussion of the work to be done, or perhaps something else that the teacher has planned. Since there are no chemicals or apparatus on the tables with which a pupil will invariably tinker, the teacher finds that he secures better attention from the class.

When these preliminaries are over, the teacher announces that the student who on the occasion of this particular experiment, occupies, say, the B position at each table, is to be the squad leader for the entire table, and should proceed to the preparation room to procure the tray for his group. These trays have already been prepared with everything necessary for the experiment for the four pupils in his group.

The teacher has designated the "B" position, because during the preliminary discussion, he has noted by a glance towards a sign on the wall, "The Squad Leader for this week is "B." This sign is changed every week to read A, B, C, or D. All classes in the laboratory are guided by this sign. In this way all students have an opportunity to be squad leaders at least four times during the term.

At the end of the experimental period the instructor gives the squad leaders instructions to gather all the chemicals, clean the sinks and tables, and return the trays to the preparation room. Each tray, by the way, has an individual scoop to aid in the important matter of housecleaning. The class is now ready for the write-up of the experiment, or any discussion that the teacher feels advisable at this point. As mentioned before, this is accomplished without any disturbance caused by students playing with apparatus or chemicals.

During this lull in laboratory work, the scene of activity is transferred to the preparation room. Depleted items in the trays are replenished by the Laboratory Assistant and a member of the preparation room squad. This completes the "distribution" cycle of the laboratory work for any one class, and this cycle will repeat itself with every class using the laboratory.

On the other hand, the work in the preparation room follows a cycle which takes a full week to complete. The chemistry department is so organized that all classes of second-term chemistry finish their laboratory work before the first-term classes begin theirs. This arrangement enables the Laboratory Assistant to prepare for one group of classes while experiments are in progress in the other group of classes.

The routine that is followed usually starts about two days before the first scheduled laboratory day of either group. A card is posted in the preparation room by the Laboratory Assistant. The card lists the materials required for each tray for the next group. These materials are gathered in advance, during the period devoted to the experimental work of the preceding group, and placed in a duplicate set of numbered trays. After the last class of the preceding group has completed its laboratory work and the squad leaders have returned their trays to the preparation room, the trays are dismantled. Chemicals and apparatus are returned to their respective places in the preparation room. The newly prepared trays are then set on the numbered spaces on the preparation room table and thus automatically complete the cycle of one week's work as followed in the laboratory and in the preparation room.

In concluding, it might be mentioned that in addition to the educational and disciplinary values derived from this plan by both pupil and teacher, the chemistry department as a whole has likewise benefited because waste of materials and loss of apparatus have been materially reduced.

ARNOLD ZELVIN.
John Adams High School.

What One German Club Is Doing

The very alert group of girls who form our German Club have started this term with much enthusiasm. (Last term they gave three programs before school assemblies.)

I have found a way to direct this enthusiasm into a channel of activity which they enjoy and which at the same time requires much more activity from them than from me, their adviser. (We know they say that the skillful administrator is the one who gets other people to do the work planned by him. We also know that a club of any kind is most successful when its members, and not its advisers, are the ones most active.)

At the first meeting of the club in the new term, I had ready five little packages of books, representing five different German plays. In each package were enough books to supply each girl who would want to take a rôle in each play. Volunteer groups were formed for each of the plays.

Scanned with CamScanner

This means that twenty-two girls memorized dramatic parts. The play having the smallest number of rôles (three) was performed first. The others are to be given later at two-week intervals.

At other club meetings the girls who are particularly interested in our yearly magazine, *Bunte Bogen*, constitute themselves as a board of editors and select, correct and discuss contributions which have been received. At three extra meetings one of our teachers, Miss Büttner, is giving talks on Wagner and Brahms and on changes in Germany which she observed during her recent Sabbatical year abroad.

DOROTHEA ELTZNER,
Chairman, German Department.

Washington Irving High School.

A French "Boner"

Mr. Editor: Is the following not a "high point"? It was at least a mirthful one on a gloomy day. The lesson was on imperatives.

Teacher: "Cinquième verbe."

Pupil: "Cinquiémissons, cinquiémissez"; let us sink; sink!

M. L. R.

"I'm Unprepared"

Perhaps the two most disconcerting words uttered by students in the classroom are "I'm unprepared." This bald response, especially if frequent, tends to undermine the morale of the class and to pique the disposition of the teacher. Class time too is usually consumed while the teacher "settles the case."

It was precisely the frequency of such an unpleasant situation that prompted me to make a little study during the spring term of 1932. During that term, when a student came unprepared in any of my classes, I had him sign his name on a form sheet and write the reason for coming unprepared. Statistically there were that entire term in my five classes of about 160 students 91 cases of lack of preparation. This number included those who failed to do all of their assigned task, written or oral. The reasons for lack of preparation, as indicated on the sheet, were as follows: 23 students were too busy with other matters or other homework; 19 failed to copy the assignment, or copied it incorrectly; 13 were ill; 5 found the assignment too difficult; 5 lost either the assignment book, the text-book, or the homework itself: 5 forgot to do the homework; 4 were absent; 3 broke or lost their glasses; 2 were lazy; 2 fell asleep over their work; 1 had a death in the family; 9 offered no reason.

In this list there were a few second offenders, fewer third offenders, and if the Baumes law were operative in school two students would now be serving life sentences. Of course some of the students might have written false excuses, but I doubt if there were many such.

The following term I adopted a new plan. When a student came unprepared I simply handed him a mimeographed sheet which read:

Date.....

Dear Mr. .....:

Your son (daughter) came to school today unprepared in.....
and offers the following excuse:

.....

.....

As a parent you understand that failure on the part of your child to do homework usually leads to bad results at the close of the term. Kindly sign this note as evidence that you realize the seriousness of the situation. Whatever you can do in the way of coöperation will be appreciated.

Very truly yours,

.....
Parent's Signature

.....

The sheet was to be returned the following day properly filled out. That entire term in my five classes of about 170 students I handed out exactly 24 such "unprepared" sheets. I felt satisfied when I compared this number with that of the preceding term. The trick worked. The "unprepared" sheet addressed to parents served as a deterrent for many a student.

CHARLES I. FREUNDLICH.
Morris High School.

EDUCATIONAL NOTES AND ANNOUNCEMENTS

Erratum

The article entitled "What to Do with the Gifted Child in Secretarial Studies," which appeared on pages 18-21 of our issue for February, 1933, was erroneously credited to Mr. Edward M. Kanzer of James Monroe High School. The writer of the article was Mr. Benjamin Fromberg, Chairman of the Department of Commercial Education in that school. Our apologies are here tendered to Mr. Fromberg for this error.—EDITOR.

A Plea to Our Contributors

We greatly appreciate the interest shown by hundreds of teachers in this magazine, particularly as that interest is manifested by sending us contributions for our columns. May we intimate, as tactfully as possible, that our appreciation would be enhanced by several degrees if contributors would have their manuscripts always typed with *double space* between the lines and if they would use only 8" by 11" paper.—EDITOR.

Latin in Italy

Under the inspiring leadership of Premier Benito Mussolini not only have new and important streets been opened up, old fora excavated and most valuable archeological remains of ancient Rome discovered, but a new and vitalizing impulse has been given to the wider use of Latin as an international language. The Institute of Roman Studies is sponsoring the undertaking whose Director, Carlo Galassi Paluzzi, announces these initial steps:

1. International congresses and conferences will be asked to publish their minutes and official statements in Latin.
2. Contact will be established with interested groups in all countries to coördinate the movement.
3. Contests will be held periodically for the best examples of written and spoken Latin.
4. Experts will be entrusted with compilation of lexicons containing the Latin translation of peculiar phrases.
5. All countries will be requested to encourage wider teaching of the language in schools and universities.

All teachers and lovers of an education which really educates will take heart anew at these forward steps. The increasing disuse of Latin among high school and college pupils in the larger cities of the United States—not so in smaller communities—has been occasioned not so much by the difficulties of the language as by the defective way it has been taught. Latin for the able youth is the one study without which there can be no real education. This new impulse cannot fail to impress both pupils and parents with the real need of mastering Latin.

Ernest D. Daniels.
Boys High School.

Ten Million More Pupils—Same Number School Buildings

Our one-room schools are gradually decreasing in number, and have been decreasing in number since 1918, the first year for which data are available, but approximately 60 per cent. of all public school buildings now used in the United States are still of the one-room type, according to E. M. Foster, chief statistician of the Federal Office of Education.

In the 10 years from 1920 to 1930, Mr. Foster points out, the number of one-room schools decreased at the average rate of 4,052 per year. From 1928 to 1930, however, the rate of decrease was only 2,297 per year. In 1918 there were 195,400 one-room schools in the United States; in 1930 there were 148,712.

It is interesting to note that the West North Central division of States, including Minnesota, Iowa,

Scanned with CamScanner

Missouri, North Dakota, South Dakota, Nebraska, and Kansas reported having 46,186 one-room schools, 79.69 per cent. of all schools being the one-room type, a higher percentage than that of any other region. Next highest percentage of one-room schools is found in the East North Central division, including such States as Ohio, Indiana, Illinois, Michigan, and Wisconsin, with 68.46 per cent. of all schools the one-room type.

Average Percentage

Of all types of schools, the average percentage of one-room schools in the United States is 60.14. New England, Middle Atlantic, South Atlantic, East South Central, West South Central, Mountain and Pacific division States fall below this average.

Not considering the District of Columbia, because it has a city environment only, Utah had the smallest percentage of one-room schools in 1930, while South Dakota had the largest percentage, approximately 14 per cent. and 88 per cent., respectively.

Number of School Buildings

"The total number of public school buildings increased steadily from 1870 to 1915," Federal Office of Education records indicate. There has been a decrease since 1915. In 1930, Mr. Foster reveals, about the same number of school buildings were in use as there were in 1900, although about 30,000 new buildings came into use between 1900 and 1915. An equal number was discontinued from 1915 to 1930. Consolidation of schools and transportation of pupils are causes of the decrease in number of school buildings.

School attendance in public elementary and high schools has shown an increase of approximately 10,000,000 since 1900.

—*Release of the U. S. Office of Education.*

For Study in Spain

Summer Course for Foreigners

This summer, as in the past summers, the Ministry of Public Instruction of the Spanish Government will conduct at the Residencia de Estudiantes, under the auspices of the Centro de Estudios Históricos, its Summer Course for Foreigners. Courses planned particularly for students and teachers of foreign birth will be given by eminent teachers of the Peninsula. In the past, the majority of the 125 to 200 students in the four-weeks course have been North Americans. Daily lectures and recitations during the first five days of the week are combined with week-end excursions to places of historical and cultural significance. Most of the students reside in the dormitories of the Residencia. The official representation in the United States of this Summer Course is vested in the Instituto de las Españas of Columbia University. The official study and travel party of the Instituto is under the direction of Mr. William M. Barlow of Curtis High School, Staten Island. Inquiries about the party or about any matter connected with study in Spain may be addressed to Mr. Barlow or to the Instituto at the Casa de las Españas, 535 West 117th Street, Manhattan.

The International University

The International University of Santander, founded by the Spanish Republic, on the initiative of the Minister of Public Instruction, Don Fernando de los Ríos, is organizing a ten weeks summer course of general studies including scientific and literary subjects, primarily for Spanish students, but which may be attended by foreign students. The lectures at the International University will be given by the most eminent professors from Spanish Universities and will be attended by over two hundred Spanish university students. It is therefore a unique occasion for anyone desiring to get into touch with real Spanish university life at a time when all other Spanish universities are closed for the summer vacation.

In addition, the International University has arranged a special course for foreign students to be held from August 1 to 30 at the Palace of La Magdalena, the former royal summer residence. The program will include study of Spanish literature, language and phonetics, art and institutions. —*News Bulletin*, Institute of International Education.

REVIEW

An analytical Bibliography of Modern Language Teaching, 1927-1932

Compiled by Algernon Coleman, Professor in the University of Chicago. The University of Chicago Press.

Few American educators of recent times are so well known to modern language teachers as Professor Algernon Coleman, author of the very much discussed "Coleman Report." Therefore, this new book by him merits more than passing notice. Despite the fact that in the present volume he avoids the controversial spheres and simply limits himself to occasional mild and brief critical comments appended to the tail-end of objective summaries and analyses, the book is bound to be of interest and profit to progressive schoolmen.

As stated in the Foreword, Coleman's *Bibliography* "is practically exhaustive for the United States and Canada, and includes also the more important contributions to the subject from England, France, and Germany. It gives a digest of the contents of all books, articles, and reports which have been published, and of a considerable number of unpublished Master's and Doctor's dissertations, in a manner adequate for their understanding, even though in brief space. It seeks to do this without bias and in an objective spirit. Occasionally, where fairness to the user of the volume demands a critical attitude, the

Scanned with CamScanner

work under discussion is judged solely for the fulfilment of non-fulfilment of its avowed purpose."

This analytical inventory consists of 570 items by over 400 different authors. New York City teachers will be especially interested to learn that of the twenty-eight periodicals from which significant articles were summarized, our own HIGH POINTS ranks fourth in the number of articles chosen, the other three being *The Modern Language Journal, The French Review,* and *Hispania;* that the largest number of Master's Dissertations dealing with the pedagogy of modern languages comes from our City College; and that the New York City *Syllabus of Minima in Modern Foreign Langauges* (1931) follows in general the results of the scientific investigations of the Modern Foreign Langauge Study, while the New York State *Tentative Syllabus in Modern Foreign Languages* (1930) shows hardly any influence at all of the eighteen volumes of researches and recommendations of the important American and Canadian Committees on Modern Languages, or, I might add, of any valuable experimental studies.

The 570 analyses are classified under the following headings: Publications of the American and Canadian Committees on Modern Languages; Psychology of Language Learning; General Trends in Language Teaching; Aims, Materials, and Methods; Tests and Testing; Correlation and Transfer; Training of Teachers; Foreign Language Teaching in European Schools. It is significant to note that of all these main headings and the many subdivisions, the subject of Reading in its various aspects, together with its essential complement of Vocabulary and Idioms, has called forth a larger number of studies than any other topic. It is also gratifying to note that most of the authors of the studies on Reading, although writing from the four corners of the United States as well as from such diverse and distant places as Japan, Russia, and India, are convinced, just as we are in New York City, that reading for comprehension and enjoyment is the paramount aim of modern language instruction.

Coleman's *Analytical Bibliography of Modern Language Teaching* is a worthy sequel to Buchanan and MacPhee's invaluable *Annotated Bibliography Methodology.* Both were published under the auspices of the Modern Foreign Language Study. The latter volume treats of the development of foreign language instruction during the fifty years prior to 1927, while the present volume takes up the story from that point and brings it down to the middle of 1932. Unlike the older volume, the more recent *Bibliography* does not evaluate textbooks nor does it consider significant trends of text-book construction. However, Professor Coleman informs us that the Committee on Modern Language Teaching (which is the present designation of the group that is carrying on the work of the Modern Foreign Language Study) is preparing a separate volume on recently published text-books and the newest tendencies in the field.

This convenient, well-organized compilation of current opinions, practices, and experimental data should prove very helpful to the many earnest teachers of modern foreign languages who desire to know what other progressive educators are thinking and doing to improve their teaching. Once again Professor Coleman has made a decidedly valuable and timely contribution towards our professional advancement which deserves to meet with a cordial reception.

Books concerned with educational matters may be sent for review to Miss Helen L. Cohen, Washington Irving High School. School text-books will not be reviewed.

The columns of HIGH POINTS are open to all teachers and supervising and administrative officers of the high schools. Manuscripts not found available for publication are not returned to contributors unless return is requested. All contributions should be typewritten, double spaced, on paper 8½" by 11" in size. They may be given to the school representative or sent directly to the editor.

Scanned with CamScanner

THE school, then, cannot build a new social order nor should teachers combine as a group to penetrate from within. This is not a matter of courage or cowardice; it is a question of fact which all history of education has proved and which the study of any educational system, even the most radical and revolutionary, confirms. The school can only build the social order which society desires and derives its coloring from the social scene; it does not create or modify it but strengthens and gives reality to it. This condition does not detract from the task which teachers can perform and that is to devote more attention to the meaning of the culture and ideals, the hopes and ambitions which society expects to attain through the school, to discover the reasons for the break in gauge between school and society, to analyze the causes for the failure of the school to fulfill the duties which it has professedly assumed, in a word, to make the public more conscious of the ideals which it fundamentally does desire for its children, to dignify and enoble them.

For the teachers as a profession there still remains the imperative duty of visualizing and giving reality to the dream of America, to discover whether there is an American culture which can furnish ideals and reality for the school; without this, preoccupation with methods and curricula, with techniques and devices for the improvement of the school, and with developing a so-called science of education, is meaningless. Without embarking on a utopian vision of a new social order, the American school still has much to achieve, if it can instil into the minds of the growing generation ideals of freedom and equality, tolerance and open-mindedness, and an attitude of criticism and intellectual sensitiveness to the situation as it is, based not on sentiment and theory but on ascertained facts and knowledge; if it can cultivate enlightenment based not on scepticism but on inquiry and thought; and if it can develop an ideal of individualism which recognizes that one's own interest lies not in success at the expense of others, but insistently demands a sense of social responsibility and coöperation.

In this sense, because these are fundamentally American ideals, the school can build the social order; in a constituted society the social order is changed by a slow process whose manifestations are incalculable; the school reflects social demands but does not initiate social change. A new education can be developed when the public has determined what the nature of the new America will be; to reverse the process would be to plough the sands.

I. L. KANDEL

Professor of Education, Teachers' College, Columbia University, in his article, "Can the School Build a New Social Order?" The Kadelphian Review for January, 1933

The Great Technology: Social Chaos and the Public Mind, by Harold Rugg . . . *Reviewed by* Sidney D. Paley 90

The contents of **High Points** are indexed in THE EDUCATION INDEX, which is on file in Libraries.

OBSERVATIONS ON READING*

IT is with some degree of hesitation that I speak to this body of expert schoolmen. You are so closely in touch with modern language teaching that I fear anything I may be able to say will be carrying coals to Newcastle and they may be of an inferior quality. However, perhaps I may say something to make my coming worthwhile, if I simply enlarge upon one or two aspects of this very big problem of reading that are already suggested in your new syllabus. Indeed, I might say that there is hardly any aspect of reading that has not been touched upon in that admirable guide for modern language teachers.

At the present time we have launched out anew on a course that aims to make reading, direct reading, the goal, and in as large amounts as are possible without sacrificing fair standards of thoroughness. We may not be as successful as we should like, but at least we shall have had a good try. It would in itself be a great step forward if teachers would wholeheartedly accept the reading aim and work towards it. Rice, in a monograph dealing with the achievement of California children, published by the Study, says, "that each teacher teaches, in the main, as he or she sees fit. One teacher believes reading to be the main objective and subordinates speaking ability. Another believes in grammar and spends a great proportion of his time in building up a systematic knowledge of the structure. A third believes that a student should learn a foreign language much as he picked up his native language, belittles any attempt to teach a living language by a method based on reading."

But conversation alone to the belief in the reading aim will not be sufficient. We must provide teachers with proper materials, with proper textbooks. A teacher may take courses in teaching, have syllabi provided him, but ultimately he will be guided very largely by the presentation indicated in the text-book that he uses. They, and not the principles he had heard or read, will be the controlling influence. The material is organized for him so that he is naturally greatly guided by it whether he is poorly or well equipped, whether he is lazy or overworked. If then reading is to be the accepted aim the books used must be as fool-proof as possible both for teachers as well as pupils and organized to this end. This applies to all kinds of books used in the course, beginners' books as well as texts for reading.

I should like to confine my remarks today largely to gradation as a factor in the organization of the reading

*An address given before the spring meeting of the Chairmen of Modern Language Departments in the high schools, March 23, 1933.

Scanned with CamScanner

course. If pupils are to acquire facility in reading, we must scrap prevailing ideas of gradation, particularly for those pupils who do not advance beyond the first two years. I do not see how it is possible to expect them to read with any real degree of skill unless we make far fewer demands upon them, particularly from the standpoint of vocabulary. Our present reading courses are too much based upon the traditional Latin course which compels pupils to plod slowly up a steep gradient due to the fact that, among other difficulties, they will have to meet so many new words in each text read.

Pupils presumably acquire as the result of studying a beginners' book a fairly good knowledge of its vocabulary. As the one chosen may contain little reading material, a Reader or a so-called simple text will probably be chosen either to accompany it or to follow. Now if reading is the aim, it would seem to be horse-sense to have a close agreement between the vocabularies of the two texts. The pupils should be able to capitalize to the fullest extent possible the highly important stock of words contained in the initial book. However, such will usually not be the case. If the books are by different authors, or even by the same author, as far as my knowledge goes, the relationship is anything but a close one. For example, the vocabulary of a very popular Grammar was checked against the words contained in a widely known Reader. It was found that about 20 per cent of the words were common to the two. And if the Reader is checked against a text which in the ordinary course of events might be expected to follow, again we find less than 25 per cent of the words common to the two. If we check the words common to the Grammar, Reader and text, only 10 per cent of the words are found in all three books. And when we realize that well over half of the words in any one text occur but once and well over three-quarters occur fewer than five times, we have a right, I believe, to conclude that no reading course, however well taught, if graded in this way as to vocabulary, will permit much improvement in the present rate of reading. I feel sure that the only way to increase the reading rate of pupils is by developing a kind of reading material that will keep within a much narrower vocabulary range than is now the case. I do not profess to know what gross reading vocabulary the average high school pupil can be expected to know as the result of two years' study. In another place I have tentatively fixed it at two thousand. It would indeed be desirable to experiment with a lower rather than a higher figure than this.

In the past few years since the epidemic of vocabulary studies, a number of books have appeared whose authors boast of the close relationship between the vocabularies contained in their books and those contained in the frequency word-books published by the Modern Foreign Language Study. But upon closer examination we find, particularly in German text-books, that the vocabularies are in reality not close and are much larger than their authors say. Although I admit this is an exaggerated case, the fact that a pupil knows *Feld* and *Herr*, does not justify one in counting *Feldherr* as a known word. Nor can we be too sure that English cognates for French and Spanish words will at once be recognized and therefore need not be counted, arguing that they will not be any added burden to the pupil learning to read. All experimental studies tend to show that we cannot rely too much upon the relationship between the mother and a foreign tongue. The French word for *âge* was missed by at least three per cent of pupils in a vocabulary test. I should therefore like to set 2,000 flat as the maximum, including close cognates and compounds in that figure. When one considers the range of meaning of many words, it will be found, I believe, ample for the average pupil.

On what basis shall we determine what words shall appear in the texts intended for reading? My answer is that they should be closely related to an accredited word-list. In spite of many criticisms and objections to word-lists, I consider those sponsored by the Modern Foreign Language Study to be one of the most important contributions of that whole investigation. I am willing to grant that for purposes of reading we might have a dozen equally good word-lists. But if a new reading course is to be launched we cannot do better than tie it, although not slavishly, to the objective word counts published by the Study.

An author who planned a whole course from the initial book through a series of interlocked reading texts would have, broadly speaking, an advantage in the development of a suitable reading course. Authors abroad have long since deemed it advisable to work out a course from start to finish, and this, I believe, accounts in part for the better results obtained there. Latterly this same plan is being pursued more and more in this country. I personally think that the best solution is for an author to provide all the organized material of all kinds necessary for pupils in at least the first and second years of foreign language study. The vocabulary could then rise slowly from the first reading material; the collocations could also be carefully graduated.

At the present time we divide reading texts, following the sequence adopted by the old Committee of Twelve, roughly into elementary, intermediate, and advanced texts. This idea of gradation will no longer do. It suggests, to be sure, a crude kind of gradation on the basis of plateaus or levels. We need, however, more than that. We need a number of texts all on the same level, all employing largely the same basic vocabulary. Instead of saying, "this is an elementary text," a publisher could state, "such and such a text keeps within the first thousand word-range," or "this text is on the 1,500 word-level." I believe that Hagboldt has the right idea in a forthcoming series of German texts. If a pupil reads five texts, 200 pages in all, that never rise

Scanned with CamScanner

above, say, the 1,000 word-level, is it not reasonable to suppose that by the time the fifth is reached his rate of reading on that level will have increased? Reading texts then that could be thus rated, whether published by this firm or that firm, would be found to be suitably graded at least as far as vocabulary is concerned and could be read in any sequence. All texts on the same level would contain a very high percentage of words in common and not as at present a 25 or 30 per cent relationship between one so-called elementary text and another. I quite realize some of the difficulties this entails and I know and appreciate at least some of the objections based either on real or sentimental grounds. It means that so far as the two-year course is concerned all reading texts must be either made to order or, if the regular short stories by French, Spanish, Italian, or German authors are to be used, they must not only be simplified from the standpoint of vocabulary, but in many other ways as well. It will naturally be easier to provide the reading material on the 1,000, 1,500, and 2,000 word-levels if it is definitely written with this end in view. It will be more difficult to bring an original French story, for example, into line, but I believe it can be successfully done.

Authors have not hesitated to construct reading material in books for beginners, but many people rightly feel that they want their classes to read some real French or Spanish. A greater objection is with regard to what many consider mutilation of an author's work. They say that simplification and virtual re-writing of a foreign author's work will not only take the heart out of a story, but is ethically wrong as well. Moreover, the reading course would then tend to become static. It would practically limit the reading to modified texts of authors who have long since passed to their reward. One might easily enlarge upon these and other points. As a matter of fact, I would advocate this kind of simplified textual material only for the average pupil in the first two years of language study. If the foreign language is to be pursued for a longer period, there are a number of natural texts which, if selected with care, might well be read without recourse to modification. Undoubtedly one would then try to choose literary texts, so far as they are appropriate, that are nearer to our own times.

I realize there is still further objection that many will raise. It is going to be difficult to keep constructed texts that have much factual content within the vocabulary range I have suggested. I am of course referring to reading material of the *Kulturkunde* type. Factual knowledge about a foreign people and small vocabulary do not readily go together. If we are not too ambitious, however, I believe something worth-while can be accomplished. It has already been found possible, particularly in beginners' books, to provide reading about the foreign people whose language is being studied which employs a small vocabulary consisting of words of high frequency. The material will have to

be kept simple as regards vocabulary and the facts easily assimilable as well, for there cannot be any detailed information or elaborate description. Much must be done by mere suggestion or reference which the well-informed teacher can expand. A reading course, however, such as I have in mind cannot, I feel sure, be successfully built round the central core "France and the French," etc. The simplified narrative story must predominate. If factual material of this nature is regarded as essential, it should be assigned as reading to be done in English during the first two years. The time to push the reading of texts dealing specifically with *Kulturkunde* is during the third and fourth years. By that time, the maturer and more highly selected pupils will have mastered the mechanics of direct reading and should be able to cope successfully with factual reading matter and the larger and to a certain extent more specialized vocabulary.

This plan of reading texts organized on the plateau basis is nothing new. You are undoubtedly acquainted with the series of English readers constructed by West on a somewhat different plan. With the work of Ogden and Palmer and, in French, with the simplified texts of Miss Eddy and others. They have shown that it is possible to offer pupils reading that is palatable even though the vocabulary range is narrow and largely confined to such words of highest frequency as have been determined by objective word counts. If there is any difference in my plan, it is that there should be a concerted effort on the part of many authors and editors whose texts are handled by different publishers to have their output conform to the above-mentioned principles. You will probably think it is a pipe-dream, that such coöperation is not only impossible but perhaps undesirable. Maybe! The fact remains, to my way of thinking, that there is no possible hope of finding a satisfactory solution of the reading problem, so far as the elementary pupil is concerned, unless we afford him vocabulary relief and a great deal of it.

The vocabulary problem, though fundamental, is only one step on the way towards simplification. If reading difficulties were simply vocabulary difficulties, we should long since have devised a technique that would have solved the problem. It is quite conceivable that a text may have a comparatively small vocabulary consisting of words of comparatively high frequency and yet be by no means easy. The great stumbling block is that in connected speech there are so many, many thousands of possible syntactical combinations. Idiom lists which we fortunately possess will be helpful in this process of simplification, and naturally difficult sentence structure will often have to be modified. We are sorely in need of syntactical studies to tell us what are the most frequent construction patterns, the causes of reading snags, and what are for pupils difficult collocations. No doubt it will also frequently be necessary, when a natural text is involved, to make some

Scanned with CamScanner

concessions with regard to the inclusion of certain words, for it will not be possible to exclude at times words that are on much higher levels. The story could not be told without them. But I believe they will be relatively few and will not violate the principle I have outlined. If necessary, help could always be given in the form of foot-notes or even by interlinear translation. Into these problems of detail I cannot go. Palmer, in a memorandum entitled "The Grading and Simplifying of Literary Material" throws some light on the matter.

Is it a confession of weakness and despair that we have to resort to manufactured and doctored reading even during the first two years of the foreign language courses? I do not know how you feel, but I for one should be contented if we could teach pupils to read with skill within the narrow range described. Surely the language study would then be of more real value to them than continuing with a kind of reading material that is obviously too difficult for them.

I should now like to retrace my steps and speak about the beginners' book from the standpoint of vocabulary. For while the gradation of texts from the points of view of vocabulary, structure, and thought will be of great help towards solving our difficulties, there will still be a need for a beginners' book in which the language to be learned is more definitely organized than any reading text could or should be. To the mere novice the new language seems but a sea of words as yet uncharted; some arrangement then seems required if the learner is not to flounder and ultimately sink. To change the figure of speech, one cannot expect the mere beginner to command a whole army at the outset. He must first learn how to control squads of words and forms, to make them execute at first only simple evolutions. I do not believe that a pupil at first learns to read simply through reading. The amount and kind of organization will depend not only on the language to be studied but also upon the degree of skill deemed necessary to make for sound reading. And it is my opinion that we have much to learn before we solve these perplexing problems. There is a great need of experimentation. For centuries now we have been very grammatically minded. It has been for the most part the tradition that the beginners' book should be closely tied to that body of knowledge, which, for lack of a better term, we loosely call grammar. As I know no better approach to suggest, I assume that the beginners' book is a sort of camouflaged name for what used to be nearly always called a Grammar. As a matter of fact, we still so call it.

I can here deal only in the matter of vocabulary, which, up to the present time, has never been reasonably well settled as to its nature, its size, and the degree of control deemed necessary. Up to within recent years each author has been a law unto himself when it came to the selection of words that were to be included in his beginners' book. He has picked them just as they came, as a well-known

author assured me some years ago he had done. And we know the results of such random picking; the words common to a group of beginners' books is few. If, however, a reading course for the elementary stage should be developed along the lines I have indicated, we ought to make some headway towards solving the problem of the vocabulary of the beginners' book in terms of the reading aim.

In general, there are two fairly distinct types of beginners' books. The first is a compendium in which the author endeavors within a comparatively brief compass to provide pupils with the language skill deemed necessary for the next, usually the reading, stage. It may of course contain some reading matter, but in relatively small amounts. It is in large measure a work book constructed along grammatical lines and containing a more or less elaborate machinery in the form of drills. The other type is a combined grammar and reader. If we think of our present state of affairs, relative to the reading aim, it would seem that the combination book has certain distinct advantages when it comes to correlating the vocabulary needed to afford adequate skill in the use of fundamental facts of grammar and that needed in reading. The author could decide within what frequency range the words in his book should lie, and then select a definite number for special practice in the form of exercises. It would be a homogeneous vocabulary divided roughly into active and passive words. Where to draw the line between the two, and particularly how to determine the make-up of the active vocabulary is by no means easy in a course which lays stress upon the oral means of approach to reading.

There have been a number of criticisms made against the word lists published by the Foreign Language Study on the score that they are defective as a basis for oral work; that environmental words are lacking among others equally important; that in general it was a reading list rather than an oral one. There are, I believe, just grounds for criticism if oral work is to play a definite part in the foreign language method, as many are convinced it should. Yet in a suggested list of 1000 active German words, published in the March number of the *German Quarterly*, I was rather surprised to see how many of these could be found in other compiled reading lists including the most defective, the Morgan-Kaeding *German Word-book* published by the Study. To be sure, the correlation between the first 1000 words contained in these lists and the active list just mentioned is not high. But if one checks this 1000 word active list against a larger figure, 2000, that I have suggested as the reading range, then the correlation is exceedingly close. Yet I must admit I am at present somewhat nonplussed when it comes to finding a wholly satisfactory solution of the active vocabulary problem in the beginners' book. If recognition grammar were generally accepted as the best means to prepare for reading, no real difficulties need arise. As I have said, a frequency list

Scanned with CamScanner

could form the basis of the entire reading course and from this the author could select important words for inclusion in the newer recognition types of exercises now being exploited. But if the pupils are to be taught an active control in which question and answer work among other language exercises are to play an important part in the development of that control, then some additions will have to be made to the objective frequency lists. It was partly with this idea in mind that a committee was appointed by the American Association of Teachers of German to revise the original German Word-book; not only was it to remedy certain glaring defects in the original list, but it was, at the same time, to make certain concessions to the principle of frequency so as to meet the general demand for words useful for classroom work in speaking. Similar concessions will undoubtedly have to be made in connection with the word lists for French and Spanish.

I should not like to leave the impression with you that I advocate any slavish following of word lists in determining what words should be found in reading texts, intensive as well as extensive, especially for the elementary stage. I am by no means a stickler for the 100 per cent agreement between them and the frequency lists. But surely frequency is a highly important factor in the selection of vocabulary. And if we tie the words of the successively read texts to some accepted list, at the same time delimiting the range, we can, if we want to, provide an abundance of extensive reading even at a fairly low level, say of 1,000 words.

Since writing out this talk, I have begun to wonder whether I have not exaggerated the need for extensive reading during the first two years of the modern language course. I notice, for example, that in your syllabus only 85 pages of extensive reading are expected of French pupils during the entire second year. That strikes me as a very low figure. One is hardly justified in calling it extensive reading even if some additional supplementary reading is done. This seems scarcely more than was done in years gone by. I may of course be wrong in thinking that more can be expected.

Before closing I should once more like to give very briefly the scheme I had in mind. The ideal combined grammar and reader would contain a vocabulary of about 1000 words, as far as possible those having the greatest frequency. The reading material would consist of two types, the intensive and the extensive, developing side by side after the first few weeks of the course. The vocabulary of each passage of intensive reading would be utilized to the fullest extent and combined with words used previously so as to provide a new and longer story that should be read with ease. Now and then one could introduce sparingly words that are to appear in a subsequent selection. As the course proceeded intensive reading would remain fairly constant as to amount; while extensive reading on the other hand should notably increase. The extensive reading proper, apart from that contained in the beginners' book, would involve a total vocabulary of about 2000 different words. These texts might be constructed on a number of levels within the 2000 range, starting with 1000, so that a pupil who had read three or four booklets at the appropriate level would be ready to cope successfully with the next higher. Finally, although I have seemingly advocated the simplification of original texts, it is my honest belief that we stand a better chance of success if the average pupil is taught during the first and second years to read textual material that is, in great measure, specially constructed for him, rather than simplified literary texts of foreign authors.

ACHIEVING THE OBJECTIVES OF HISTORY TEACHING*

WORKING from the dictum of progressive educators that society and school cannot be divorced from each other, it necessarily follows that the tremendous advances which our industrial economy has made in recent years has rendered obsolete the pedagogical principles of yesterday. Predicated upon a static social structure, they ill meet the needs of a world of changing social values. History has taught us that the *sina qua non* of the preservation of any civilization is ready adaptability to change. Our educational system must, therefore, consider this social phenomenon in the reconstruction of its methodology.

The conventional recitation with its emphasis upon the attainment of knowledge, rather than upon thinking, is obviously passé. Its direct antithesis, the laboratory method, transcends the anachronistic hearing of recitations which makes of the teacher a martinet, rather than a director of the thought processes of his students. If reflective thinking is accepted as a worth-while objective, the teaching of history must be raised out of the morass of a dry, uncritical recital of unimportant data. The imagination of the student must be stimulated. This alone makes possible the evocation of creative ideas. The laboratory method purports to make history real, alive and vital. The student is in a workshop (library) surrounded by material and tools out of which he can fashion crystallized concepts. This, of course, demands a predetermined and intelligent supervision by the teacher.

Here no premium is put upon the collocation and absorption of facts—a time-hallowed, but unfortunate, educational objective. Pedantry must go if it makes wisdom impossible. "One

*This is the third in a series of articles designed to show specifically how the classroom teacher attempts to realize the objectives of history teaching.—ASSOCIATE EDITOR.

Scanned with CamScanner

must not only know, one must understand."

The laboratory method does away with false indoctrination and catechization. The student is compelled to search, to study, to weigh and compare. Independent and clear thinking is developed; and all of the faculties of the learner are brought into use. The hope of building an intelligent and socially minded citizenry is dependent upon these considerations.

The following are presented, not as typical model lessons, but as suggestions of the immense possibilities inherent in a progressive method, and, incidentally, represent an honest attempt to develop an intelligent appreciation of history.

I.

THE DEVELOPMENT OF DEMOCRACY

Ultimate Aim: To develop in the students an ability to interpret charts that express social science data.

Specific Aim: The development of democracy in Europe since 1789.

Procedure: The chart furnished you presents the development of democracy in Europe since 1789. Bear in mind that

a. The expression "European country" refers to England and the countries on the continent of Europe.

b. The expression "Continental country" refers to a country on the continent of Europe and *does not* include England.

Answer the following questions based on the chart by filling in the space provided:

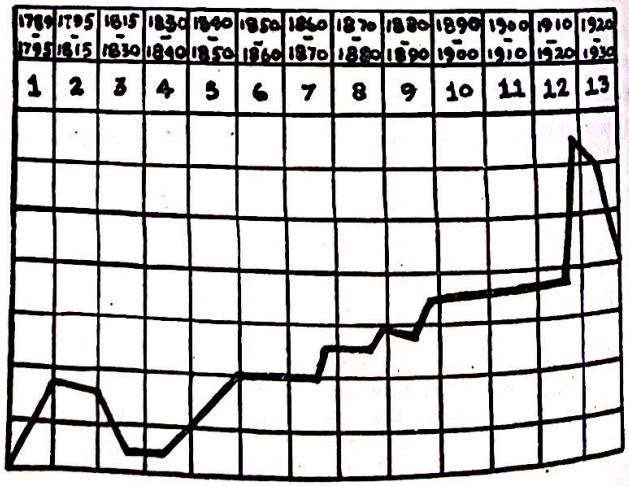
1. Name one document adopted by a European country which explains the rise of the line in column I.....
2. Mention the name of a person most responsible for the downward trend of the line in column II.....
3. Mention one body of men whose policies were responsible for the sharp downward trend of the line in column III.....
4. Name the person whose policies and influence are most commonly associated with the downward trend of the line in column III.....
5. Name a reform measure adopted by a European country which accounts for the rise of the line in column IV.....
6. Do the same for column VII.....
7. Do the same for column IX.....
8. Mention a change in a continental country which explains the rise in column XII.....
9. Mention a change in another continental country which explains the rise of a line in column XII.....
10. Name a reform adopted in a European country outside of those you mentioned in questions 8 and 9 which accounts for the rise in column XII.....
11. Mention a change in a continental country which explains the course of the line in column XIII.....
12. Name a person whose policies and influence are associated with the downward trend of the line in column XIII.....
13. According to the diagram, the decade during which democracy in Europe made the greatest gains was between the dates of.....and.....
14. According to the diagram, Europe in 1930 was (a) more democratic than it was in 1914; (b) less democratic than in 1914; (c) neither of these. Why?

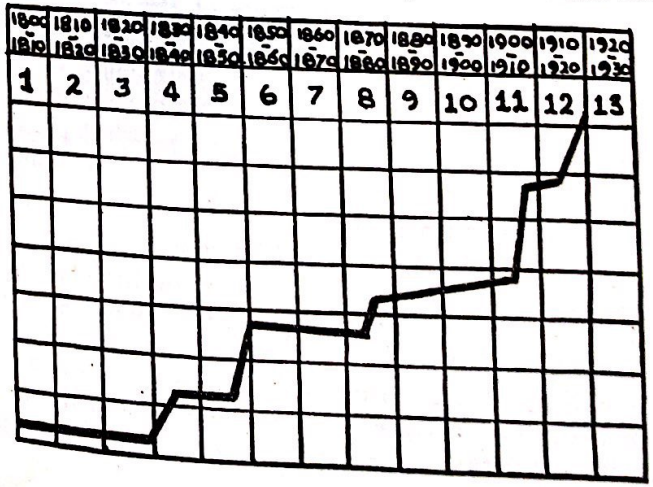
Final Problem: The activities of President Roosevelt during his first two weeks in office have caused the people to refer to him as a dictator and have led them to compare him with Mussolini. Do you agree with this comparison? Why? Do you think it would be desirable to substitute for our form of government the type of government that exists in Italy or in Germany today? Why?

II.

SOCIAL LEGISLATION

Ultimate Aim: To develop in the students an ability to interpret charts that express social science data.





Scanned with CamScanner

Specific Aim: The history of social legislation in England.

Procedure: The chart furnished you represents the development of social legislation in England since 1800. Examine the chart closely and answer the following questions based upon it:

1. The longest period during which there was no social legislation enacted was between the dates of.....and.....
2. The second longest period during which little or no social legislation was enacted was between the dates of..... and.....
3. The period during which, prior to the World War, there was most social legislation enacted was between the dates of..... and.....
4. The period during which England followed most completely the policy of *laissez-faire* was between the dates of..... and.....
5. Mention one law which is responsible for the upward trend of the line in column IV.....
6. Do the same for column VIII .....
7. Do the same for column XI .....
8. Do the same for column XII .....
9. The person most responsible for the upward trend of line in column XI was.....
10. The rise of the.....Party was to a large extent responsible for the enactment of a program of social legislation in England during the last twenty-five years.

Final Problem: To what degree would the present depression in the United States be relieved if we adopted England's scheme for social reform?

III.

Treaties of Alliances

Ultimate Aim: To develop in the students an ability to interpret and express social data represented by a map.

Specific Aim: Treaties of Alliances as an underlying cause of war.

Materials: A map of Europe.

Procedure: Below is a paragraph taken from Fay's "Origins of the World War." Read it and answer the questions below on the map provided you.

"The greatest single underlying cause of the War was the system of secret alliances which developed after the Franco-Prussian War. It gradually divided Europe into two hostile groups of Powers who were increasingly suspicious of one another and who steadily built up greater and greater armies and navies. These were the conditions which caused Germany to think that it was being 'encircled' by enemies."

Questions:

1. Put the letter "A" in the spaces representing the nations "encircling" Germany through treaties of alliances.
2. Place the letter "B" in the spaces representing the nations that completed the "encirclement" of Germany during the World War.
3. The maneuvers of what two national fleets bore out Germany's fear of "encirclement?" Place "C's" in the countries of the above-named fleets; put the letter "D" in the regions where the fleets would be stationed in order that the encirclement of Germany and her allies be realized.
4. Put an "E" in the country, a member of the Triple Alliance, which, because of her coastline, would fear the English fleet and would always qualify her alliance to the Central Powers in favor of not antagonizing Great Britain.
5. Place the letter "F" in the countries toward which Germany would probably turn to offset her "encirclement."
6. Place the letter "G" in the country whose governmental system made the Allied claim of waging war "to make the world safe for democracy" seem shallow and unjustified.
7. Place the letter "H" in the countries of today which, because of dictatorial rule there, make the foregoing Allied claim seem farcical and insincere.
8. Place the letter "I" on the land frontiers on which Germany would be fighting if her claim of "encirclement" were correct.
9. If you think her position was advantageous, place the number "2" there. Justify your answer on the paper provided, using the map as your text and source of information.
10. Austria and Serbia were rivals in the Balkans. Place the letter "J" in the country that had an understanding with Serbia to protect her against the aggressions of Austria.
11. Place the letter "K" in the countries that would be dragged into war because of alliances with Serbia's protector.
12. Name the region on the map that was the danger zone of war in 1914.
13. Name the region on the map created by the Treaty of Versailles that has produced another such danger zone.
14. Below it put the name of the country that was probably instrumental in or guilty of creating such danger zone.
15. Place the letter "L" in the spaces representing countries that would probably be allied to France today because of their hostility to Germany.
16. Rumania is a traditional enemy of Hungary. At the end of the World War Rumania received the strip of territory known as Transylvania from Hungary. Place the letter "M" in the countries that would probably be allied to Rumania because of their hostility to Hungary.

Scanned with CamScanner

17. Poland today as a nation was formed from strips of territory taken from three former Great Powers. Draw lines with arrow heads leading to the nations which thus might be allied against Poland.
18. Both Poland and Rumania received strips of territories from Russia after the World War. Draw a line with arrow heads leading to both Poland and Rumania. On the line write the name of the treaty which calls for mutual aid if Russia attempts to get these territories back.
19. Place the letter "N" in five countries that are being encircled today because of alliances that have been formed since the World War.

Final Problem: Assuming that you accept the introductory passage from Fay as a premise, discuss the probability of war because of the danger zones that have been created since the World War and because of the treaties of alliance formulated to maintain these zones inviolate.

EDWARD M. COHEN,
WILLIAM FEINGOLD.
Samuel J. Tilden High School.

SAINT SCHOOL TEACHER

IN European art galleries a picture frequently seen which stands out conspicuously is that of Napoleon Bonaparte. Strikingly arrayed in royal robes, he is portrayed with a crown of leaves upon his head and an imposing, imperial sceptre in his hand. Place beside it a mental portrait of Demien de Veuster dressed in the simple raiment of a priest and teacher, with a silken cord around the waist of his plain black skirt. The man from Belgium who ministered to the lepers of Molokai seems to suffer from such a comparison with the man who became a world conqueror. If we think a little longer and if we view the portraits in the light of history, we undergo a mental change regarding the contrast. We recall that of everything Napoleon strove for, nothing remains. We are no longer impressed with the robe and sceptre or the pomp and power. We know that the life of the other man was not that of a scavenger. He sought to serve others and not himself. His portrait becomes surpassingly beautiful as we think of the high motives as well as noble principles for which he lived, labored and died.

Of all who serve humanity, no single social group sinks itself so out of sight in service performed as do school teachers. The good they do and the truths they teach are accepted the world over without return of ample material reward. The lives they live place them on the high plane of character builders, the majority utterly lacking in materialistic self-assertion.

When one observes a group of boys and girls rushing nervously from one activity to another, unwilling for the most part to think quietly about anything, does it occur to the onlooker that in the average child the appetite for food is not much different from the appetite for knowledge? Each child is decisive that something be given him to satisfy his hunger and he is ready to be mentally fed with what is offered, as it is offered. The mind of the child may be offended as readily as his function of digestion. And it is forgotten by the majority of us that one of the main reasons our minds are not spoiled is because of the wholesome and far-reaching influences of our school teachers.

Henry Ward Beecher offers a glowing tribute to his boyhood teachers who presided over the little white school house nestled in the heart of the New England hills. It was from this far out of the way place he found enrichment of his individual self that gave so much value and power to his life. "As the teacher is, so is the school," reads an old-time aphorism, and as a well-known educator recently affirmed along the same lines, "As the teacher is, so is the student for all remaining years of his life." Who is there today who has not benefited from the work in which school teachers are engaged? Who is there who has not gone back to the classroom to remember his teacher as the spring from which like the mighty Amazon he derived his power? Who, in the assembling of this array of idealized characters, has not included one or several of his school teachers? Next to the mother no other human being ever comes into closer association with child-life than does the teacher. Theories of education may come and go, but the character of the teacher is written indelibly upon the impressionable mind of the child. For five days out of the week, the teacher faces the child problem in the classroom, knowing full well that knowledge can never of itself be an end result in teaching. This may not agree with many theories held by the school teacher's critic, but in spite of theories it will always exist as a fact. The influence of the teacher goes beyond the classroom lessons to the child's physical well-being, his social aspects and his future vocation. The teacher seeks to inspire the boy to want a job in which he can be useful and at the same time enjoy life.

One reason why this country suffers today is because we have forgotten that the world at large is more indebted to Socrates than to Croesus; to Samuel Hahnemenn than to political and financial plunderers; to the Great Teacher than to the money changers in the temple. Most of our modern inventions and refinements which increase human comfort with the lessening of labor are material achievements. Our advancement is a commercialized one, characterized by high buildings, big corporations and million dollar deals. Too much time has been spent in building tiled bathrooms in workingmen's homes connected with networks of sewers, and too little time spent in cultivating and

Scanned with CamScanner

renewing ideals and aspirations that have been taught us as fundamentals by all the great teachers of all ages as well as our own individual school teachers.

As someone has said so well, "One saint in an age can make the whole life of that age qualitatively different." True measurement of progress is whether or not the great multitude has been lifted a millionth of an inch in a thousand years, and just that is what our teachers are doing for us, in spite of ourselves. The historian of the future will measure our advancement not by the height of our skyscrapers, but by the results our teachers have attained in the building of character, which is the true education of men.

Who but the teachers whose names glorify the pages of history have kept the world marching upward toward the light of truth? How much of this truth and wisdom would be left us if we did not possess philosophy and teachings of men like Socrates, Aristotle, Montaigne, Emerson, William James, Thomas Arnold, Mark Hopkins, Samuel C. Armstrong, and Mary Lyon? Literally millions of other teachers have left the clear imprint of truth as an unspoken and undying argument upon the souls of men. Jesus of Nazareth, Himself, was a teacher whose methods and principles for right living are fundamental in all good teaching today.

Approaching the theme fom another angle, let me repeat what was told me recently by a friend of mine, the present editor of *The American Agriculturist*, about a teacher, a principal for many years of a small country high school. This friend of mine was an awkward, bashful farm boy. Obliged to help harvest the fall crops, he was unable to start his courses in high school until late in the fall, after the village boys and girls were quite advanced in their year's classes. The boy visited the principal's home and, while waiting for him to come downstairs, the boy sat down in a chair and on the teacher's derby, completely ruining the hat. He had to take a grip on himself to keep from running away. The principal came in, noticed the hat, assured the boy that it was of no consequence, patted him on the back, and told him that he would personally help him make up his studies so that he could catch up in his high school classes. Later, this teacher gave my friend hours of extra time, helping him in many ways to procure an education, even to the extent of offering to loan him money out of his small salary with which to go to college.

During all the time this teacher presided over this school, it made a record for a school of its size for the large number of boys and girls who had been graduated and sent to institutions of higher learning. Today, after 30 years, there is a large local club in that community named after this high school principal, and men and women from every walk of life meet annually in their old home town to do honor to this great teacher.

Taking a potshot at the teaching profession is one of our modern indoor sports. All of us set ourselves up more or less as experts on education and on teaching methods, and when all other topics of conversation fail, we always land with heavy criticism upon the teacher. His vacation is too long, he has too much spare time, he is overpaid, he has too many newfangled methods, too many frills, too little readin' and writin' and 'rithmetic. Meanwhile, the teacher plods along, an example of praiseworthy conduct, unrecognized by adequate compensation, giving cheerfully of his sustenance to the poor and needy in his classrooms, providing food and shoes, as is the custom of school teachers in the city of New York. They toil in life's workshop, keeping "their faculty of effort" alive by daily gratuitous exercises. Minds that are soaked with money values and have no vision beyond the commercial realm fail to understand its meaning or even to discover the existence of this disinterested service. The service of the school teacher is not for sale any more than truth can be gotten or forgotten for gold. However, it will do them and us no harm to remember our school teachers and help them in their enduring to the end. Perhaps it is not within our financial ability to provide a life income for a school teacher as did the late William H. Todd, the well-known ship-builder; yet it is within our power personally to defend the record of the school teacher against all unjust criticisms.

ERNEST RISLEY EATON, M.D.

THE TEACHING OF LATIN*

THE universities are removing Latin from their lists of entrance requirements, but more pupils are studying Latin in the high schools of the country today than all other foreign languages combined. This is all the more remarkable considering the antiquate methods used in teaching the subject. One may fairly say that there has been no important improvement for four hundred years. There have been mechanical changes in text-books, better type, better pictures, rearrangement of topics. More or less collateral matter in English about Roman customs, personalities, weapons, and military tactics has been introduced. The teaching and learning of the language itself, however, remains about the same as in the days of Luther when, as he reports, a recitation in Latin was like a trial for murder.

Grammar is no longer committed to memory *in toto* as a snake swallows a chipmunk, but in the main the objective remains the same—to master "the grammar." Latin teachers today still labor under the delusion that grammar is the key to language. They have tried to rationalize their procedure with the help of a few catchwords, borrowed from an arid and sterile psychology, such as "formal dis-

*A paper read before the Latin Section of the Society for the Experimental Study of Education at its January meeting.

Scanned with CamScanner

cipline," "association of ideas," "training for power," "training to reason." They are still engaged in trying to erect a pyramid with desert sand.

Yet every now and then there arises a Latin scholar of distinction to protest against the killing process of Latin teaching. Such protests have come in cyclical periods, and if we attend closely we observe that every one of the reformers protested on similar grounds and was in possession, more or less clearly, of an identical psychological concept.

The protest of the great Latinists has been directed against the atomizing of the language. Learn the language in organic units, they urge. Absorb the language as it lives, not in dissected and rearranged particles.

This protest is heard first from the father of Latin grammar himself, from Quintillian: "Aliud grammatice, aliud Latine loqui," he wrote. "To write grammatically is one thing, but to write Latin is something else again" —an epigram which the grammarians who sit in school teachers' chairs find it impossible to understand. The objections of boys, weary of ceaseless drills in grammar, are brushed aside as the protests of dunces unable to "exercise their brains." How is it, then, that the same sort of objection is heard from the most brilliant of scholars and linguists?

The great Erasmus himself, the author of text-books that were best sellers for a century wrote ("De Ratione Studii"): "But I must make my conviction clear that whilst a knowledge of accidence and syntax is most necessary to every student, still they should be as few, as simple, and as carefully framed as possible. I have no patience with the stupidity of the average teacher of grammar who wastes precious years in hammering rules into children's heads. For it is not by learning rules that we acquire the power of speaking a language, but by daily intercourse with those accustomed to express themselves with exactness and refinement, and by the copious knowledge of the best authors."

He objects to the ignorance shown by pupils of the names of the commonest objects around them:

"Although knowledge of words, and a ready and proper naming of everything that occurs is an admirable and necessary foundation for learning, yet this is neglected above measure in the common methods of teaching, by which omission it happens that after children have drudged many years in the elements of erudition they scarce know the proper names of the several species of trees, fishes, birds, beasts or grain; even at home, the very furniture about them or the various necessaries which are there daily used, they know not how rightly to name in Latin."

Erasmus wrote "readers" for Latin students, intended only "to make easy and pleasant the once thorny path of learning," which became tremendously popular throughout Europe. The "Familiar Colloquies" discuss not only such topics as eating and drinking, ball-games and polite manners, when to cough and when to sneeze, but also

much deeper subjects, as the one in the dialogue between a youth and a harlot, in which the youth tries to convert the girl to a better life; or that in the shipwreck, where, in the presence of death, the intimate superstitions of the passengers come to the surface. This book ran through a hundred editions from the time of its first publication to the author's death, and its popularity continued for two centuries after it had ceased to be a text-book but had become "literature."

Did the school-masters adopt Erasmus' suggestions? Not if one may judge from the criticisms and the new methods presented by subsequent reformers. "I hate those who can brag of their rules of grammar and can neither write nor speak a language," wrote Montaigne. "I find the choicest men are they that most condemned rules."

Montaigne had learned his Latin from nurses and servants, all of whom had been ordered by the elder Montaigne to play the game of Latin-speaking, whether speaking correctly or not.

"There are those who know neither ablative, subjunctive, substantive nor grammar no more than does their lackey or any oyster-wife of the streets; and yet if you have a mind thereto, they will entertain you to your heart's content and perhaps stumble as little and as seldom against the rules of their tongue as the best master of arts in France."

Some sixty years after the publication of Erasmus's "Colloquies," Roger Ascham, the tutor of Queen Elizabeth, hit upon a unique variation of the basic idea we are trying to trace. After a few preliminary lessons on "the three concordances," Ascham was accustomed to translate a page of Latin or Greek to his pupil, carefully explaining the points that at first sight seemed obscure. He then let his pupil "sitting by herself where no man shall prompt" write the translation in a note-book. After the lapse of an hour, the pupil having given up her Latin book took a fresh note-book and wrote in it the retranslation of the same passage into the original tongue.

The teacher compared the pupil's Latin with the original, meting out due praise but finding little fault, for Ascham believed in the inspiration of success.

Elizabeth, says Ascham, "never took Greek or Latin Grammar in her hand after the first declining of a noun and a verb; but only by this double translation of Demosthenes and Isocrates daily, without missing a forenoon, and likewise some part of Tully every afternoon for the space of a year or two, hath attained to such a perfect understanding in both the tongues and to such a judgment as there be few in number in both the universities or elsewhere in England that be in both tongues comparable with her majesty."

It is hardly necessary to add that Ascham's double translation method had no chance of being generally adopted.

About the same time there appears in England another reformer, Dr. Joseph Webbe, applying for a patent upon a new method, which he called the sentence method. Webbe

Scanned with CamScanner

refused to impart his method in detail unless he were given the patent to protect his pecuniary rights. In his application to the High Court of Parliament for a patent on his method of teaching Latin he wrote:

"There are two sorts of Latin, whereof one is Grammar-Latin and the other Latin-Latin. By Latin-Latin I mean such as the best approved authors wrote, and left us in their books and monuments of use and custom. By Grammar-Latin I understand that Latin that we now make by Grammar rules; the first intention of which rules and their collection was to make us write and speak such Latin as that custom and those authors did, which was Latin-Latin; but it succeeded not."

Dr. Webbe's method would have produced "an incredible advantage to the whole nation," wrote an enthusiastic disciple, "but we are in this like tradesmen who bandy and confederate together to suppress any new invention though never so commodious to the commonwealth, lest thereby their own private gain should be obstructed or taken away."

Objection was made by some that Webbe's method made learning too easy; others protested that the method was unsuitable to slow-witted pupils. To this he replied that one can't make the learning of a language too easy; and as for dull pupils, they never have learned Latin by any method.

Again, it was asked: "If you take clauses out of authors and think of the meaning of the whole, how do you know what each word signifies?"

Webbe answered: "Construing word for word is impossible in any language, e.g., in the barbarous English of the Frenchman, 'I you pray, sir,' for 'Je vous prie, monsieur'."

It is better, Webbe contended, "that a scholar should remember the natural and received position of a clause by keeping the words all together, than understand the particular correspondence of the words, and thereby lose their proper places. For discretion and comparison of clause with clause will at length bring the understanding of the words whether we will or no; but nothing will bring the true position of these words again."

Webbe's method fared no better with the schoolmasters than did Aschams.

Another half century or so later we find the great Moravian, John Amos Comenius (Komensky), born in 1592, urging that words should not be learned apart from the objects to which they refer. He further shocked the grammarians by announcing that the complete and detailed knowledge of a language was quite unnecessary and that it was absurd on the part of anyone to try to attain it.

"Not even Cicero (who is considered the greatest master of the Latin language) was acquainted with all its details," wrote Comenius, "since he confessed that he was ignorant of the words used by artisans; for he had never mixed with cobblers and labourers, so as to see their handiwork and hear the technical terms that they used. Indeed, what object could he have in learning such terms?"

Boys should be given texts that appeal to them. "Those who place before them Cicero and other great writers waste their time, for if students do not understand the subject-matter, how can they master the various devices for expressing it forcibly?"

That was said about three hundred years ago, but Cicero is still read by those who think that he was a kind of Roman Walter Hampden.

A little later, in 1650, John Milton, no mean Latinist, objects in a letter to Mr. Hartlib to learning words apart from substance. "Hence appear the many mistakes which have made learning generally so unpleasing and so unsuccessful," writes Cromwell's Latin secretary. "First we do amiss to spend seven or eight years merely in scraping together so much miserable Latin and Greek as might be learned otherwise easily and delightfully in one year."

He objects, especially, to the preposterous "forcing the wits of children to compose themes." Themes are still being wrung from students in foreign language classes, especially in those preparing for Regents' examinations.

Locke, somewhat later, in his "Treatise of Education of Youth," says with relation to Greek and Latin exercises: "Don't let your son be forced to make Latin themes, declamations or verses—unless you design to make him a Latin orator or a poet."

The truth so clearly grasped by Ascham and Webbe, Milton and Locke, although neglected by school teachers and school systems, was rediscovered in the latter part of the past century by the Frenchman, Gouin, who presented it anew in his well-known series method, making the unit of instruction a group of related sentences, rather than a single sentence.

Gouin's idea has received a certain amount of bewildered attention in modern language text-books. It is now considered the correct thing to incorporate a "series" or two in every such book. The student, however, is helped very little by these concessions, neither he nor the teacher knowing what to do next. The Latin text-book writers for the most part remain blissfully ignorant of such low, unintellectual methods and refuse to tamper with the sacred ritual of parsing, synopses, principal parts, inflections and genuflections.

What is this truth, this principal of learning which can be seen cropping out in the suggestions of the reformers we have mentioned? It is none other than that which is known today as the Gestalt principle. Learn your foreign language in a context; learn it in action. You can't learn it by cutting it up into fragments, even though the fragments belong in some logical classificatory system, as "parts of speech," "forms" of the verb, "cases" of the noun, or "laws" of the subjunctive.

"Gestalt" is a new name for an old idea we are told. A new name makes an old idea new by setting it in motion. "Gestalt" may be translated "configuration," or "pattern," or the "unit," or "whole" of perception. But

Scanned with CamScanner

most writers leave it untranslated and the English reader, like the German reader, gets its special significance from the context.

A human face is a good example of Gestalt. What it is can be expressed best by illustrations. People speak of the expression of the eyes or of the mouth in a face. But experimenters have transposed sad eyes to smiling faces and, lo! the sad eyes smiled. Expression belongs to the whole face and not to one or another single feature.

A tune is not a mere summation of notes, but a unit, an indestructible whole. You may have the same tune transposed to different keys, just as you may have the same face enlarged or diminished, painted in different colors, its expression altered within limits, and yet it will be the same face. A sentence, a poem, a sermon is a Gestalt no less than a picture or a tune. Words in a sentence derive their meaning from the sense of the whole. "This is a capital story: Albany begins with a capital. It is a capital of the state. The capitol in the capital has a few Greek capitals. It took considerable capital to construct this building, in which a bill to abolish capital punishment was defeated."

Gestalt was the ruling principle of the impressionists, who discovered that details matter only to the extent that they convey a perception of the whole. A beginner in painting is inclined to draw every tree of the woods, every stone in the building before him. But most of us see not the trees, but the forest; not the stones, but the building.

The good writer thinks in paragraphs rather than in sentences. When you utter a sentence, words seem to come out of nowhere. You know them first after they have been spoken; as the driver of an auto in a pinch observes that he has done this or that after the action is completed. The particular action, like the word, is part of a context in which each individual fact is unnoticed until analysis sets in.

Many of us have taken lessons in driving with a golf club and have been surprised to find that immediately after the lesson we were worse players than before. The swing of the golf club is a Gestalt, a single rhythmical motion, and must be learned as a whole. Try to put the swing together by attending to foot-movements, pivoting on the hips, bending the wrists, holding the head and the eyes, "following through," and the scores of small items into which the whole swing has been analyzed and you get —a fluke.

As to the underlying physiological set-up of Gestalts, there is not at present complete agreement. The theoretical work of the original Gestaltists (Wertheimer, Köhler and Kofka) has been subjected to some destructive criticism. Gestalt, however, as a fact of observation, remains unshaken. We perceive Gestalts, we remember Gestalts, and we remember details as integral parts of organized wholes.

You may observe that once a task is completed you dismiss it from your mind, but leave a thing undone and it remains to plague you. A gap in any unitary discourse aches until it is filled up. This suggests why the Gestalt principle is of such enormous importance in the psychology of language learning.

This obviously is the principle that the great linguists have grasped and endeavored to apply in the teaching of Latin—Quintillian in his advice to write Latin not as it might be reconstructed according to rules, but as it was heard; Erasmus, with his insistence upon learning Latin from interesting stories about familiar subjects; Ascham, setting out from and returning to an original text; Webbe with his sentence method, and Gouin with his series.

Stated with reference to present circumstances, Gestalt in Latin teaching requires: (1) The abandonment of texts that are outside the field of interest of pupils — the history of Caesar's military campaigns, for example. (2) A transvaluation of the value of grammar, so that grammar shall be regarded not as the door to language, but as a set of traffic signals or mile-stones assuring the driver that he is keeping on the right road and turning at the proper points. (3) Sticking to models, in sentences and larger wholes, and being content with reproducing those models with very slight if any variations. (4) Learning whole sentences from the very beginning and, when in doubt, always referring back to a sentence-Gestalt rather than to a paradigm.

The transformation in classroom weather by these changes would be (and has been, in certain known instances) magical. It is not, of course, true that every dunce can become a good scholar, but observance of the true psychology of learning will remove from willing students the impression that they are engaged in twisting ropes of sand. Above all, what is learned in the classroom, whether much or little, will be Latin, and not the debris of pulverized classics.

ABRAM LIPSKY.
Seward Park High School.

THE CASE OF ALEXANDER

ALEXANDER is a problem case. His English teacher feels strongly about him. She charges that he refuses to do his English either at home or in class; that he even refuses to bring his books. She may go further. She may complain of him as an insolent rowdy, who not only will not learn himself, but by his misconduct prevents the class from learning. She has done all she can with him; now, she feels, he must either reform or get out.

Alexander cheerfully admits all this. He doesn't like English or, usually, his other academic subjects. In most cases (remember, Alexander is a type, not a person) he'd like nothing better

Scanned with CamScanner

than to leave school and go to work. Sometimes he complains that the work is too hard for him—that he can't do grammar or understand "the book." Occasionally, however, he professes himself perfectly satisfied with his situation at school. Leave? Why? He finds school life agreeably relaxing to his nerves, jaded by the harassing demands of his social life. As for these little alarums and excursions into the dean's office for misconduct and loafing—why, they add the one touch of variety and excitement to a routine that sometimes threatens uneventfulness.

If you dig into Alexander's small dossier (and his high school career rarely goes beyond the second or third grade), you will usually find a record of uniform failure in all subjects, or of repeated failure in the same grade of English. Testing seventy Alexanders in a body, you discover that the Henmon-Nelson Test of Mental Ability gives Alexander an average mental age of two years, eleven months below his average chronological age of fifteen years, nine months; and the Thorndike-McCall Reading Test, Form I, puts him three years, two months below. A home-made reading test administered to the seventy Alexanders and to twenty classes of unselected first termers gives similar results. On a scale of 10, Alexander scores 7.1, as against 9.3 for the others—only 76% as well.

Alexander, then is about three years below his grade and age level in intelligence and in reading ability. To give him regular high school texts and the regular syllabus is to doom him t a Sisyphus struggle with an impo sible task. Clearly, we must segre gate him and supply him with muc simpler reading and a special syllabu

Accordingly, the call goes out to a first term teachers. We ask them t note carefully that Alexander differ from the "slow" pupil. Usually th "slow" pupil, like Barkis, is "willin'." But Alexander is not merely "slow" he is also distinctly "unwillin'." Fur thermore, we require, as a check o the teachers' judgment, that Alex ander have a record, either of failur in all subjects, or of repeated failur in the same grade of English. We or ganize the seventy assembled Alex anders into two "X" classes. Inci dentally, the teachers' estimates ar strikingly confirmed by the readin and intelligence tests, given after th event. The comparative results hav already been noted. Of the seventy examined, only three rate at normal o above in intelligence, and only two i reading.

In laying out a syllabus, we mus put aside traditional ideas. Wha we must ask, are the most important and pressing needs, immediate an remote, of this Alexander person? On of the most urgent is, obviously, im provement in his reading. No one lacking mastery of the printed pag can expect to live with reasonable ful ness and intelligence in this age o print and democracy. Now, many published experiments seem to indi cate that the most practical way t such improvement is a long course— a year at least—of easy, rapid pleasur

reading in material well at the intellectual and emotional level of the pupil. For Alexander, our regular texts are out of the question. The attempt to force them on him has resulted in making him dislike school and reading. In a little questionnaire he is asked to fill out, forty-one of the seventy indicate English as their most disliked subject, and only three as their favorite one. He must, therefore, read books at the twelve or thirteen year level. But it would not be wise to ask Alexander to take them at the public library. He might be ridiculed; and then, too, his well-documented attitude towards any kind of home task makes it unsafe. Hence we proceed as follows.

We strain the financial resources of our school library to collect several shelves of attractive books for thirteen-year-olds, books with the widest possible variety of boy-appeal. Then after a talk on "The Fun of Reading," we ask Alexander to select, from a list of types on the board, those types of books he prefers. With these choices in our hand, we lead him to the library, and assign him a book of his choice. Back in class once more, we explain the reading diary he is to keep in his notebook:

TITLE_____ AUTHOR_____ KEPT FROM____ TO____

DATE	READ P..... TO P.....	NO. OF PAGES	NO. OF MINUTES	BRIEF COMMENT ON THIS PART OF THE BOOK

We assign the keeping of this record as the standing homework assignment till further notice. Two books a week, and a hundred pages a day, are the aims for the first half-term. We begin this program right then and there.

The next day, our check on this record (and such a daily check is indispensable) disappoints us. Many pupils have done nothing, for reasons as diverse as the moods of love. Others have crawled through four pages, five pages, seven pages, ten pages. Only a dozen have done fifty; only four (the confirmed readers), one hundred or more. We blame the unfaithful, act deep disappointment, and hint at the importance of this reading to promotion. But our praise of the faithful is almost hysterical. We mention them by name with long and honorable citations, and give them the privilege of going to the library at any time for an exchange of books.

Such steady, even-tempered daily pressure brings results. Within a week everybody (except five incorrigibles, who remain so) is doing at least forty to fifty pages; many do a hundred; half a dozen do two hundred.

Scanned with CamScanner

With everybody except the Old Guard reading, our next task is to improve speed. Alexander is doing less than half a page a minute of this childish stuff. So we talk up speed, demonstrate that it is just an easily-changed habit, hold some class practice, and suggest a goal of at least two pages a minute.

Is there cheating? Do pupils make unfounded claims? Probably. We poke good-natured fun at one boy who pleads poor memory when questioned about his reading. This has some effect; the boy joins in the laugh, and promises amendment. Our weekly story-telling day, based on this reading, also helps to keep Alexander down to earth. But is there any sure-fire way of ensuring honesty?

Another habit and skill which we feel Alexander should develop is the daily reading of a reputable newspaper. The importance of this is obvious, both for him and for the rest of us who have to live in Alexander's country and suffer the consequences of his acts. But the thing is difficult. Every non-tabloid paper we try—even *The American*—bristles with strange, long, hard terms that bore Alexander. Then, too, the important articles require a historical, geographic, and political background that he can lay no claim to. He feels at home only in the "funnies," the pictures, and the crime and sex scandals of the tabloids.

The importance of the need justifies our attempt. Beguiling Alexander with a siren talk into "shelling out," we place the class subscription for *The American* (it should have been *The Journal*) with the G. O. store. Then after spending a period becoming acquainted with the departments and uses of the paper, we begin reading the more personal narratives of social and political import, and after that attack the front page, and ultimately the editorials. We approach each article as we would Milton's "Minor Poems": motivation, explaining difficult terms, supplying necessary concepts, posing the problem, silent reading, comprehension check, and, finally, application or discussion looking to the forming of sensible opinions. The work is sometimes boring. Getting Alexander to understand exhausts him and us, and leaves little incliniation for discussion. Next term we shall try *The Journal*.

So much for the reading part of our program. In expressional work we begin with Oral English. Our first search is for a stimulating subject. After failing with "Hobbies" (which required outlining too difficult for Alexander at this stage), and with "Tales My Father Tells" (Alexander is too self-conscious), we strike pay ore in "Interesting Movies."

We begin cautiously. Alexander's morale, his self-confidence, so badly shaken by years of school failure and inferiority, must be restored. We ask casually if anyone has seen a good "movie." One "movie fiend" responds with a full-length, finished-in-oils account of one. The class listens rapt, and one or two others begin to correct details. But no one else offers an account that day. For several days we encourage, but do not require such reports; and we carefully refrain from criticism, accepting gratefully the most atrocious and inarticulate recitations. Gradually, as they find themselves free to talk or keep silent, a few more find their tongues.

The next step is to introduce organization and outlining. After demonstrating, dramatically, how impossible it is to build a house, take a trip, fight a battle, or do anything else worth while without planning, we practice outlining movies for parts of two periods. Then we tell "team-stories"; that is, each team consisting of three pupils gives a coöperative account of some "movie." This arrangement not only forces Alexander to use careful logic in dividing and subdividing the story, but it enhances his courage and confidence. The ensuing accounts are more numerous, more pointed, more fluent.

From then on, our progress takes several directions. First, Alexander must learn selection. His subjects are now limited. Instead of rambling through a whole story, he must confine himself to one aspect of plot, character, or setting. It may be "The Incident I Should Have Liked to Witness," or "The Character I Admire Most," or "An Incident Which Taught Me a Lesson," and so on. Another change is from a discussion of "movies" to that of his reading. "Movies" have served their turn.

The next step is improvement in sentence structure. It is easy to demonstrate the maddening monotony of "and." It is equally easy to explain, and to drill in, the use of "ing" beginning (the present participle) and of the "When, as, because, if beginning" (the subordinate clause). The next assignment is: "Now that your speech is outlined, write out five sentences of each type—sentences you will use in your speech tomorrow."

As finally standardized, the last step in preparing a "speech" is vocabulary work. Deficiency in vocabulary has been Alexander's stumbling block all along. Poor sentence structure and villainous grammar, however they detract from effectiveness, are no positive bar to understanding. But a word—if you don't know the word for something you have seen in a movie or read about in a book, you just can't say that thing, as Alexander has ruefully admitted more than once. Our vocabulary work consists, first, of finding synonyms for all kinds of "blanket" expressions used in context. More specifically, the day before a "speech," we develop at the board lists of "expressions" which the particular subject of that "speech" will probably call for. Alexander is also encouraged to run over his speech mentally, and to ask for "better words." Finally, he is instructed to write out ten sentences containing such "expressive words"—sentences he will use in his "speech."

All this preliminary work has several advantages. This continuous mulling over a subject gives Alexander that familiarity with it, and hence that confidence he so badly needs. It ensures definite training to every effort, and prevents the aimless rambling of so much "free discus-

Scanned with CamScanner

sion." It makes certain fundamentals of rhetoric thoroughly practical; drill leads directly to use. Finally, it leaves no room for failure, and hence for self-distrust. Instead of criticism after a performance, we have training before it. Alexander learns by his successes, not by his failures. Of course, this preliminary work, all done in class, eats up time; but the results, we feel, justify the means. Besides, Alexander's well-known attitude towards homework makes any other plan shaky. Then, too, his reading might be interfered with.

But with regard to grammar, to common errors, and to the mechanics of writing, we must report failure. Alexander yawns cavernously at the very mention of them. It is such work that has disgusted him with school, and that is familiar to the point of staleness. (Now, sentence work and vocabulary study are not quite so trite). We never could convince him that he ought to improve his grammar or his writing. He probably feels, though he is too inarticulate to say so, that writing doesn't fit into his scheme of things. A factory hand, an unskilled laborer, a truck driver—what will he ever write beyond a two-line scrawl from Niagara Falls or Bear Mountain? He laughs at the idea of writing an application for a job. The way *he* gets a job is by going from one factory to another. In short, we can't find the chink in his self-sufficiency. Next term, we'll try having him set up business, as a store keeper perhaps, and conducting his correspondence with his customers—the rest of the class. That may work.

But what seems to us far more important than Alexander's dislike of writing is his feeling about the society he lives in. Frankly, Alexander is not a good citizen. A pariah at school as far back as he can remember, he has become an Esau towards school, towards his teachers, towards authority in general. Authority denotes to him, not common protection, not cooperation towards a common end, but merely unreasonable and unnecessary bullying. For instance, he resents the restraints put upon him at school—resents them without the faintest inkling that they are necessary when so many people live at such close quarters as a classroom. He regards "cops" as natural enemies, as "crooks" and "grafters" who, like teachers, are paid "fat" salaries for doing nothing. He has no notion of loyalty to a bigger group than his family or his "pals," or of a duty transcending his duty to these, or of that enlightened selfishness which ties all men together. In his relations to the community, "All is fair in war." He will do anything he can "get away with," regardless of society's laws or society's interests.

Suppose—we ask—suppose he could run a profitable "speak-easy" with impunity; would he? Would he! Of the seventy voting, only one, a girl, timidly dissented. Suppose he chanced to see a murder committed; would he feel it his duty to inform the police? Certainly not! That is their business, not his; that's what they get "fat" salaries for! Besides, he might

be "put on the spot" if he "squealed"! Suppose his friend had committed a murder; suppose he saw a policeman attacked by a mob; suppose——. And the discussions that rage have the tone, so far as we can judge, of Al Capone's gang in council. And these youngsters, so utterly anti-social, have had at least five years of Civics in grammar and high school, not to mention years and years of history teaching that is supposed to make for good citizenship!

Now, the importance of this attitude of Alexander's needs no explaining. Such an attitude, it seems to us, needs only the occasion to wind up ultimately as crime. This attitude must be removed, and a more wholesome one implanted.

First of all, certain causative conditions must be altered. Alexander must no longer continue to feel himself at odds with society, as represented by his school and his teachers. We must avoid every suggestion that he is inferior, or "different." His school tasks must be such as to inspire him with a feeling of ease, of well-being, of confidence in the classroom. School restraints which irk him must be demonstrated, dramatically and practically, as being unavoidable, not merely in a classroom, but in any assembly of considerable size.

We must be careful, too, to set the example of courtesy and even temper. Granted we feel sure that Alexander is misbehaving purposely and knowingly, will it help us to grow angry, to take it as a personal affront, to shout, to threaten, and—worst of all—to show contempt? All this tends to keep Alexander an incipient criminal. What we need is the calm, scientific objective view of Alexander's misconduct. Alexander is a piano, which reacts as we strike the keys. If his reactions displease us, should we kick the piano or improve our fingering? Even if we feel that this human piano needs punishment as one mode of fingering, that punishment should be administered quietly (though of course, firmly) and, above all, without contempt.

Besides, let us be careful. Are we sure Alexander means to be insolent when he flings a pencil down on our desk, or jostles us in passing, or laughs that peculiar horse laugh? It may be only the unintentional boorishness of an ill-bred boy who knows no better. If we speak angrily to him, he *may* turn insolent. But if we point out quietly that his conduct is hardly good manners, he may grin sheepishly, and perhaps beg pardon. And, perhaps, in time he'll cease doing some of the things that irritate us so.

In these ways the demands of classroom discipline may be used to plant in Alexander a more wholesome attitude to school and to authority. But it is also necessary to alter his whole social philosophy—the whole system of his feelings towards organized society. We spend much time in discussing such questions as are listed above. We attempt to dispel the romance woven around crime and criminals by sensational pictures. Is a gangster brave? As brave as a west-

Scanned with CamScanner

ern bandit? As brave as a police-
man? We attempt to give Alexan-
der some vision of the need all men
have for each other's help; of the tre-
mendous cities and civilizations men
can build when working together; of
their helplessness when alone. Next
term, when this social point of view
begins to percolate, we shall attack
the more subtle and more generally
condoned forms of political and social
evil. Has a voter the right to sell
his vote? Or to pretend to sell it?
Has he the moral right to trade his
vote in return for aid in securing a
job? Even if he is of the same party,
and, especially, if he joins the party
for the sake of that job, should he
vote that party's ticket if, in his
heart, he feels differently? Should a
voter always be regular? Are
"bosses" necessary, beneficial? Who
is to blame for corruption?

It is hard, slow sledding. Fre-
quently the interesting discussion led
up to and carefully prepared for,
doesn't come. Or frequently one or
two Alexanders argue so shrewdly
for their perverted philosophy as to
put us at a loss for a ready answer,
however much we feel the wrongness
of their view.

And now, what are the results?
The last day of the term, we invite
Alexander to help us plan next term's
work. Will he please write, anony-
mously and in a disguised handwrit-
ing, his absolutely genuine and abso-
lutely frank opinion of our work this
term? In every reply except three,
Alexander expresses himself as satis-
fied. Of course, his opinion is not
worth much in some matters. His
natural desire to say the pleasant
thing must be discounted. We note
that the very words which state how
immensely he has improved in Eng-
lish show the same old atrocities. But
the moral tone of these letters is sig-
nificant. They are friendly and hope-
ful. Many say this is the first "square
deal" they have ever had, the first
term of English they have ever liked,
the first time they have ever spoken
before a class, or discussed matters of
conduct, or learned to enjoy reading.

To achieve a more objective meas-
ure of our gains, we give a little ques-
tionnaire, and compare the answers
with those to a similar one given at
the beginning of the term. In the
earlier one, only three had indicated
English for their "best subject," and
thirty-six had taken it for their worst;
in the present one, the figures are
forty-one and six. The question-
naires show gains in the amount of
reading done, in the number of Alex-
anders who select reading for their
hobby, in the number who read the
front page of the newspaper. The
answers to several moral questions in
the second questionnaire show quite a
general realization of that enlightened
selfishness which makes for good cit-
izenship. Form three of the Thorn-
dike McCall, if it means anything,
shows a gain of a year, achieved in
one term.

Shall Alexander be promoted?
With the exception of the five re-
calcitrants, assuredly. He is entitled
to promotion on the basis of his ef-
fort. Any other standard of judg-

ment is, in our opinion, unfair, and
would undo all the moral good we
hope we have worked in him. Some
day educators will stand aghast at the
memory that once, in the dim, unen-
lightened ages, thousands of Alexan-
ders were flunked, all over a whole
country, because they could not fill
the Procrustean mental bed of some
American high school.

H. C. BRICKER.
Grover Cleveland High School.

H. P.

H. P. forms the mystic sign under which instruction in the use of the library is given to students at Curtis. Students say that these letters recognize their plea "Help, Please!" Teachers aver that this formula stands for "Horse Power"—dynamic motivation. While the instructing librarian trusts that the library lessons are both helpful and powerful, her meaning for the letters will appear later. Meantime she confesses that the horse part of the power is to be taken literally.

The lessons are built about the horse as integrator of the field of knowledge in general, and of the high school curriculum in particular. Since a catalogue card for individual book-entry in a printed bibliography has not been found to lend itself well for use as a flying carpet on which to travel from country to country or from age to age, an animated quadruped has been chosen for those who would join the Hobby Riding Club, or, more prosaically stated, the group of students who some day would pass their required four-year English "Regents'" questions on the use of the library.

To make the students feel as much like discoverers as possible is the method we prefer to saying the dictionary contains this, the encyclopedia that, and the card catalogue all about something else. By the exploration method the various library "first aids" are as systematically reviewed as by the older method and the results of the students' technique are tested in the English composition or other report on the phase of the subject the individual student has chosen to explore. We aim to have the students include in this paper notes of the sources of information in good bibliographic form, so that those who start to earn their living immediately after high school will have this technique for their pleasure or profit, and those who receive further instruction will have started to "document," in the standard way, their historical, scientific, or other papers, in which they give references to the literature of the subject.

We prefer to begin the instruction the second term, that is, after the

Scanned with CamScanner

student has got used to the general complexities of citizenship in a community of several thousand persons, and soon enough for the individual to be able to use the technique throughout the high school course. But, whether the subject matter mentioned is a bird's eye view of what is to come in history, or whether the topics covered are a rapid review of a modern language already studied through several terms, the Library's aim is to emphasize the fact that a unified picture of the subject under investigation is to be got, as a whole, from the library exploration, to stress the interrelations of the various studies in the school curriculum, and the necessity for knowing sign posts and short cuts, in order not to become completely lost in the mass of ideas to be found in print even in a small library.

Glimpses into the greater libraries beyond the school walls are also given, such as of the city activities information to be found by civil service candidates in the Municipal Reference Library, the home economics and journalism material to be found at the Teachers College and the Columbia University School of Journalism Libraries, the music, advertising-art, and technical scientific collections in the Reference Department of the New York Public Library on Fifth Avenue.

The library ride starts with a reference to some recently published book, such as Will James' *All in a day's riding*, or *Tschiffely's ride*—and the "horses are off." The plan of the book arrangement in the Curtis Library is introduced as a kind of map to be galloped over, with occasional pauses for more details—as Tschiffely might pause to look at a sunset after he had climbed a special peak. As real persons with special bents, although all are members of the cavalcade, at the beginning each student elects to be a "Spanish cavalier," a Roman or Arthurian knight, a hippologist, a musical chevalier, or any thing that fits in with an occupation or hobby he or she may later prefer to emphasize. The organization of the Dewey classification is explained, as a series of convenient pegs on which to hang the information obtained. Since all are horsemen, we see first what our own school card catalogue has to offer under the heading "Horse," and then proceed to other book lists, such as the *United States catalogue*, and *Cumulative book index*, to other lists of books at the end of our *New international encyclopedia* or *Encyclopedia Britannica* articles, to the *A. L. A. catalogue*, and the *Book review digest* with its subject index, to the *Reader's guide* and other Wilson Company indexes available.

Along the way we find, if the Boys' Riding Club presented the Library with a certain sum of money to spend on horse books, just what we would like to buy, what we could buy, whether we would get illustrations in colors, how long the books would be, how recent they would be, where we would find evaluative book notes to the effect that, even though a book was older, it might be better for our purposes than more recent ones. Thus the practical significance of the imprint and collation details given in all standard lists, and the way to find the class and author number on the cards, and the books on the shelves, from this location number are discovered.

Meantime the *United States catalogue* has told us the name of the author who wrote the *Four horsemen of the Apocalypse*, the names of the other books written by the author of *Smoky* and through the Granger *Index to poetry* we have discovered who wrote "Sheridan's ride," and just what happens, according to Kipling, where "East is East, and West is West" when horse thieves are abroad.

Since the circus has just been in town, the question as to the horses' part in it arises and an acrobatic horseman looks, in the Wilson Company periodical indexes, for an article on this subject said to have been published in the last five years in the *Theatre arts monthly*. To add to the pictures by famous painters which illustrate this circus article, another investigator tries the *New York Times index* for pictures of the supposed quadriga horses atop the Vittorio Emannuele monument in Rome, and also for descriptions of the International Horse Show of Art held in New York City in 1932. Some one reports a Christmas horse-tail present to President Roosevelt and the name of the former steed, who wore the tail, is also pursued in the *New York Times index*.

Our practical horse raiser seeks helpful books, with annotated descriptions, in the *A. L. A. catalogue* and the subject index of the *Book review digest*, periodical articles on the relative pulling power of different breeds of draft horses, and information as to horse-racing laws in the *Public affairs information service*, known, for short, as the *P. A. I. S.*, and information as to the world records of fast trotters in the *World almanac*. He also seeks references, in the *New guide to reference books* compiled by I. G. Mudge, to agricultural helps such as the United States Department of Agriculture *Agricultural yearbook*, and notices of standard hitches for twelve horses in the United States Bureau of Standards *Standards yearbook*. He searches for the addresses and names of editors of magazines about horses in the subject lists in Ayer's *Newspaper annual*. To *Webster* he turns for the meaning of "tarpan," and to the Century *Cyclopedia of names* for the pronunciation of Przewalski's horse. He compares the Century *Cyclopedia of names* with that admirable new desk manual, the *Oxford companion to English literature*, and notes, especially, how to pronounce the name of Odin's horse, Sleipnir.

From book and poem lists we proceed to the other books of concentrated information known as "reference books." Webster's *International dictionary* tells us whether to say "steer-up," or "stir-up," and how the meaning of the word was evolved. The *Oxford New English dictionary* (Murray's) gives us information as to just why we call a bad dream a

Scanned with CamScanner

"night-*mare*," and our Roman knight informs us, through Webster and Harper's *Latin dictionary* and *Dictionary of classical literature and antiquitities*, of the Greek and Latin origins of the words "cavalry" and "equitation." The Romance language caballero explains the difference between a plains and a navy mustang, how the bronco got its name, while our musical horseman shows, not only how to discover the pronunciation of the dance called the *galop*, but also where the accent is on "Cavalleria rusticána. Through these questions not only have the foreign-language-English dictionaries come into play, but also the foreign-language dictionaries such as the *Petit Larousse illustré*, with its biographical and geographical section, and its explanation of such terms as *califourchon*.

The musical cavalier also looks for horses in music, in the Walkure music of Wagner, in Grove's *Dictionary of music;* he goes after horse songs, too, in the Sears *Song Index*. In this, with the aid of a student of German, he finds the "Reiters Morgenlied," the song whose first line is "Mein Schatz ist ein Reiter," the authors of the words and music of "Wer reitet so spät durch Nacht und Wind," and returns to Grove if he wishes a hunting "song without words," for a tone picture.

Not to be outdone by the musician, the journalist-to-be of the cavalcade begins on Cruden's *Concordance* to the Bible and Clarke's Shakespeare concordance. He finds that what a Hebrew seer thought a vain thing for safety, a Shakespearean king would give a kingdom to have. He compares Job's and Shakespeare's descriptions of an excellent horse. He investigates the significance of Elijah's horses of fire in the Jewish encyclopedia, and of Phaethon's wild ride, in Greek mythology and the perpetuation of the latter's name in the name of a modern carriage. From Hoyt's *Cyclopedia of practical quotations* he discovers Kipling's idea that

"Four things greater than all things are—

Women and Horses and Power and War."

Browning's idea of Muleykeh, Bret Harte's of Chiquita, Holmes' of "How the old horse won the bet," Byron's of "Mazeppa's ride," Scott's of Lochinvar's, Shadwell's of Caligula's horse "shod with gold and bitted with gold" and made a consul

". . . Afar on the Appian Way,
Blazing with diamonds like a star
Consul Romanus!!
S. P. Q. R."—

and of the famous dashes of Paul Revere, and from Aix to Ghent.

As a writer aiming at breadth of information, this horseman also familiarizes himself through *Who's Who in America* with the ranching experience of Will Rogers and Will James and, since he must know geography and history as well as biography in reference books, he locates Abingdon in Lippincott's *Gazetteer* and the Rand McNally or other atlas to see where the Saxons carved the horse in the chalk of White Horse Vale.

After the glimpses of "horse sense"

in the bibliographic tools and general and special books of reference, we tour the shelves in the order of the Dewey classification to see what we can find about horses. In the 100s there is little aside from a book or two on the animal mind, as philosophy and psychology, naturally, are not high school subjects. In the 200s—religion—we come across Bulfinch's *Age of fable* and discover which of the Heavenly Twins, Castor and Pollux, was famous for managing horses, and what part horses had in the naming of Athens and in the downfall of Troy. Here, too, is the *Ecclesiastical history of the English nation* by the Venerable Bede, which tells that horses were first saddled by the English in the reign of Edwin the Great.

As the 300s in the classification are varied, we find everything from horse economics and equine law to folk customs in Brand's *Popular antiquities*, where the appearance of the hobby-horse in the Abbot's Bromley folk dance (to be seen every spring at the Seventh Regiment Armory) is mentioned. The 400s have already received much attention in the reference books since the dictionaries may be considered philological books. We recall this fact, in passing, by referring to the distinction between the words "courser" and "corsair" (the name of a Curtis publication).

In the 500s, we point out horse fossils in the geologies, mention sea horses and books such as Loomis' *Evolution of the horse*, and then proceed to the applied science of the horse in the 600s—horse raising, training, utilization. Here are investigated the mysteries of horseshoeing, of horse products—pony coats, horse steaks, kumiss, horsehair products—horses as power, e. g., the origin of the term "horse power," horses as drawers of street cars and of canal boats, types of horses—Flying Childers, Justin Morgan, Maud S.—as described in Taunton's *Famous horses*, Washington Irving's classification of horses in his *Sketch Book*, and in the National Geographic Society's *Horses of the world*.

In the 700s, as in the 300s, again we have a great variety of materials—everything from painting to the sport of horse-racing. Because many of the most convincing illustrations are in books in the 700s, we spend a large amount of our time on these. While in the mythologies we may find reproductions of such famous paintings as Reni's "Aurora" showing Apollo's horses, in the books of the 700s we are sure to find Athenian cavalry in the frieze of the Parthenon, chariot horses on Titus' arch, the oldest known illustration of a horse cultivating the fields in the Bayeux tapestry, horses on coins and in Durer woodcuts, ladies playing polo in Persian 17th Century prints, artistic paintings of draft horses in Rosa Bonheur's "Horse fair," and of saddle horses in the portraits of Velásquez, Vernet, Meissonier, Van Dyck, LeBrun, and Makemono, and pictures of the innumerable equestrian statues of all capitals, such as Shrady's statue of Grant in Washington, or Verrochio's Colleoni in Venice. Many of

Scanned with CamScanner

these may be found in such anthologies as *Saddle and song* and in Pyle editions of the *Knights of the Round Table.*

In the 790s, we come across references to the *hestavig,* or horse fight (mentioned in Beowulf), which until recently was a favorite sport with Norsemen. Here also we find equestrian sports taking an important place in the 1932 Olympiad at Los Angeles.

In the 800s come all of the literary references to horses, many of which, in drama and poetry, have already been mentioned in connection with reference books. In addition, there are many delightful essays such as Amy Lowell's on the horses of St. Mark's, descriptions of knights in *Ivanhoe* and in the *Morte d'Arthur,* horses in Chaucer's *Canterbury tales,* in Arnold's *Sohrab and Rustum,* in *Tom Brown's school days,* classic bits of humor such as David Harum's horse trading; in the literature of classical languages there is the chariot race in Sophocles' *Electra,* descriptions of Caesar's cavalry, Virgil's description of the capture of Rhesus' horses; and, in modern languages, Storm's *Schimmelreiter,* Bavieca of the *Cid,* Aligero clavileno of *Don Quijote,* Rosinante of *Les trois mousquetaires,* Bayard of the *Orlando furioso.*

With the 900s our tour of the shelves ends. Here we find Cunninghame-Graham, in his *Horses of the Conquest,* quoting Cortes' followers as saying, "After God, we owed the victory to the horses." In accounts of the battle of Hastings, we have the Norman cavalry winning the day. Holinshed's *Chronicles* tell us how many horses Queen Elizabeth had, and Traill's *Social England* shows Chaucer and others on horseback. Lamb speaks of the horsetail standard of the Tartars, handed down from the times of Genghis Kahn, and in such series as *Longmans' historical illustrations, England in the Middle Ages,* appear many pictures of mounts for ladies and gentlemen for sport or for war, from the 11th to the 16th centuries.

We may easily imagine some future examination question on the use of the library phrased as follows:

When the following gentlemen appear, bring out the right steed for each, from the horses in the stables of the ages, to "witch the world with noble horsemanship"—Bellerophon, Achilles, Hiero, Alexander the Great, Caligula, Ruy Diaz, called the Cid, Renaud de Montauban, Mahomet, Rustum, King Marko, King Arthur, Cuchullin, Odin, D'Artagnan, Napoleon, Washington, Tschiffely. The steeds in the stable are—Bavieca, Bayard, Borak, Bucephalus, Incitatus, The Gray of Macha, Mancha, Marengo, Nelson, Pegasus, Phrenicus, Raksh, Rosinante, Sharatt, Sleipner, Spumador, and Xanthus.

When we think of the heroic images these names call to our minds, the third and most important meaning of *H. P.* appears. Our talks on the use of the library must be helpful. They must have horsepower. But, above all, librarians feel that the students must HAVE PICTURES. These may be graphic word pictures; they may be vivid tone pictures, as of Händel's "Harmonious blacksmith," or, best of all, they are actual pictorial representations. Because we have found that illustrated lectures are as much more popular as are "picture books," we always try to include opaque projections in our talks. Since at Curtis we have no special arrangements for darkening the Library, nor for changing from opaque (that is, mostly book and card) illustrations to transparent ones (of slides or films), we choose the most arresting printed illustrations obtainable in black and white or color. Our selection is made from the foregoing wealth of material according to the grades of the students, their electives and extra-curricular activities, and according to the number of periods that classes may devote to learning how to use the Library. So far as we may judge over a short time, we have the satisfaction of knowing that the information on the use of the Library is well remembered. This, we believe, is because the instructing librarian has taken pains to give a clear-cut, well illustrated presentation of the subject, grouped about one object—"with teeth in it"—from the point of view of her hearers' special interest.

MARIE K. PIDGEON.
Curtis High School.

THE TEACHING OF ETHICS THROUGH POETRY

TO discover the Ideal in the Actual requires the seeing eye of the poet. Surely we need the vision now more than ever before, buried as we are in the depths of depression and materialism. Some would-be educators even wish to take poetry away from our present course of study, forgetting that education, in the very nature of the process, means a "leading out." A leading out of what? That is the vital question. Some of us believe it is the soul of the child which is to find expression, the qualities of mind and heart which determine his future. We have little enough ethical instruction in our public schools at best. If literature is to give way to business letters applying for the position of errand-boy or stock-girl, how are the boys and girls who have no cultured home environment ever to have the glimpse of that "light that never shone on land or sea?" Now that the world is in turmoil, is it not time in education to begin a crusade for beauty and the eternal verities?

Naturally, this kind of inspiration must come as a by-product in our classes. We cannot use literature for sermonizing any more than we can ruin a Greek tragedy by analyzing the syntax of unusual words. A suggestion in passing, a phrase here or there, will strike a responsive chord and the work is done. We teachers must make up our minds to leave results like this to Providence. We never

Scanned with CamScanner

fully know how much good—or harm—we do.

Let me take a few of the required poems in our present course of study. How can we use them for ethical teaching?

The poetic beauty of story and language in "The Ancient Mariner" should not be overshadowed by emphasis on the moral of the tale. If, however, young minds can grasp ever so slightly the truth that Love is the link between man and the Power behind the Universe, that all forms of life are a part of One Great Whole, they begin to have a faint conception of one of the greatest occult poems in literature. In the eighth term we have this same idea of "Nature's social union" in Burns' "To a Mouse" and "To a Mountain Daisy." The animals and the flowers are especially close to the heart of Burns, who seems to have the mysticism of the Far East in his reverence for all forms of life. We shall speak of him again later on.

In the second term, in the "Odyssey," we have the hero who overcomes obstacles, the hospitality that sees a god disguised as a stranger or a beggar, myths that hide universal truths. What is the real meaning of the adventure in the land of the Lotos-eaters and the trip to Hades? May it be that the great forces of Nature still have their guardian deities or rulers? Is there something we have lost to be regained as we progress further in evolution and become more worthy of the knowledge now hidden from a material age?

In Shakespeare's plays we are the characters. We are noble or base. With them we make decisions for better or worse. We see the working out of the law of cause and effect. We suffer or we rejoice according to our deserts.

In term four we have Gray and Goldsmith, some of us, together with poems of today. The "Elegy" gives the beauty of simple country life, the compensations of obscurity, and the fact that all must meet the change called Death, leaving behind pomp and material glory. In "The Deserted Village" we realize that the common man, the worker, is the backbone of any nation. As most of us come under that category, it is a comfort to realize our importance in the economic structure. Here, too, the village preacher takes his place in the galaxy of saintly souls along with Chaucer's parson and the God-like priest of "Les Misérables." Even "The Traveler," scorned by many pedagogues as hopelessly antiquated, shows that the only place to find happiness is in our own hearts. A very great Teacher once said, "The kingdom of Heaven is within"; while the Greek philosophers impressed the mind of a neophyte with the words "Know thyself."

"The Idylls of the King," in ten or six, furnish almost unlimited material for ethical discussions. Truth, honor, loyalty, unselfish service, courtesy, family duty, meeting difficult situations fairly and fearlessly, the sure penalty for wrong doing, are some of the endless themes so graphically told that they provoke discussion often

without suggestion from the teacher. To become effective as character training, though, they must be brought out of the abstract or imaginary situations and applied to the experience of the pupils. Discussions on school questions, for example, arising as an application of the abstract statement of an ethical problem, are an effective way of making pupils think practically and sincerely.

Term seven brings Milton's "Comus," where we again see "How charming is divine Philosophy." The power of goodness, the importance of one's thoughts, the supremacy of a developed soul over circumstances—these are only a few inspiring truths that may find fertile soil in the heart of a receptive pupil.

Nor must we forget the "ill-starred Burns," who did so much for animals and the common man, singing of brotherhood the world o'er, yet to be realized. His warning to withhold judgment, his sympathy for sinners, and the wonder that people make out as well as they do, considering their handicaps—all this is still needed today, more by us teachers perhaps than by the children, for in many ways we are in danger of becoming too self-righteous and over-critical.

I have not mentioned Shelley in his inspired quest for Spiritual Beauty, or Keats who asked nothing more than the loveliness of this earth, or Wordsworth and his "trailing clouds of glory," or the twentieth century singers to whom a "thing of beauty" is still a "joy forever." You all have your favorites. The children will catch your enthusiasm. But we must have the spark ourselves and "wing our work" if we are to fan the flame in those mysterious beings whom we sometimes call our stupid pupils. Not stupid, only unawakened, with minds centered on problems or burdens perhaps too heavy for young shoulders!

I sometimes put the question, "Is poetry an aid in business?" Some smile a bit indulgently as at a queer but harmless person with strange ideas. Gradually we lead up to the fact that imagination, the mark of the poet, is nothing more or less than the picture-making power of the mind. It is this constructive power—vision—that enables man to build for the future. He sees his store bigger and better, thronged with customers. His windows are the most attractive on the avenue. Car after car rolls up to his doors as prosperous patrons come to seek his wares. What did it? The poet's imagination, the picture-making power, which creates in the thought world the scene or event which finds expression on the material plane. The story goes that the great singer, Patti, as a child used to pretend that she was singing before a vast audience and after the song would present herself with bouquets. How many wonderful flowers found their way to her feet in later life! I used to know a solemn little child who would teach by the hour a class of two, her favorite doll and her equally beloved cat. Frequently the cat would go to sleep and her complaint used to be, "Mother, Treasure is such a sleepy scholar." "Sleepy

Scanned with CamScanner

scholars," alas, still cross her path. You have all heard how the boy Lindbergh carried his bicycle to the limb of a tree and mounted it, flying in an airplane on the wings of imagination. It would really seem that

"There's nothing good or bad
But thinking makes it so."

Some philosophers tell us that thought is a living current. We are radio senders and receivers, attuned to varying rates of vibration. If, then, thoughts are actual things "with healing, strength, and wings," or the reverse, how great the need to think only what is "true, honest, pure, lovely, of good report" that, like the poet, we may use this vibratory power of imagination to build structures of surpassing loveliness! In the thought world, at least, we can picture only the beautiful and maybe some day know the joy of visions realized.

Thus we return to our starting point, "To discover the Ideal in the Actual requires the seeing eye of the poet." Plato told his pupils that in the mental plane every conception is perfect. It is only the illusions of a material world that make this beauty seem imperfect. The poet or seer can penetrate the ugly exterior and know the radiance within. He can hear the harmony in immortal souls hidden by "this muddy vesture of decay." Carlyle calls the poet "the most precious gift that can be bestowed on a generation," and says, "We see in him a freer, purer development of whatever is noblest in ourselves; his life is a rich lesson to us; and we mourn his death as that of a benefactor who has loved and taught us."

Since, then, without vision a people perish, can we neglect the message of the poets to the youth of today? Our responsibility is great indeed if, instead of bread, we offer a stone. According to Keats, the course of study should be simplicity itself, for you recall his definition of ethics in education:

"Beauty is truth, truth beauty,—that is all
Ye know on earth, and all ye need to know."

MABEL P. SCHMIDT.
Morris High School.

A NEW DEAL BY THE ENGLISH TEACHER*

NONE of you can gainsay the fact that in times gone by much just criticism has been centered around the school curriculum and the methods of teaching. The immortal bard of Avon more than three hundred years ago doubtlessly expressed the sentiment of his own day when in the second act of "As You Like It" he wrote of

". . . the whining school-boy, with his satchel
And shining morning face, creeping like a snail
Unwillingly to school."

And up to the beginning of this century the same opinion unquestionably prevailed.

Have you not seen countless cartoons extolling the virtues of the "ole swimmin' hole" at the expense of the little red schoolhouse? Has not that unnaturally stiff, prim lady, the schoolm'arm of former days, been relegated to the limbo of the horseless carriage of yesteryear?

And when we look into the causes of this widespread ridicule of school life we do not have to go far to find much material for just criticism. Like the other subjects of the curriculum, the teaching of English has rightly come in for its share of condemnation. A recitation was a re-citation of the facts gathered from the printed page, in the same manner in which they were originally presented; in other words, the system known as "backing the book" was in vogue. The center of the educational universe was the subject and the approach was purely formal and logical, rather than informal and psychological as it is today. In the teaching of grammar, for example, stress was placed on the technique of expression rather than on function or use of words and ideas; sentences were analyzed at great length; words were parsed for no apparent reason; and the entire subject assumed the proportion of a drill in mental gymnastics. Many of you no doubt remember your own introduction to "Macbeth" and "Hamlet" as source-books for syntactical exercises. In composition work material was presented in a very formal manner, being based on stilted, unnatural situations rather than on the actual experiences of the student. In literature, the chief aim was mastery of content, rather than enjoyment, appreciation, taste, and style. Burke's "Speech on Conciliation With the American Colonies" was considered a storehouse of dry statistics to be reproduced verbatim rather than as a mine of material which, when considered in the light of present-day conditions, is both practical and helpful. The point of contact between the cold, printed page and living, breathing, current situations was disregarded.

And yet in spite of all the untiring efforts of former leaders in education, composition such as the following actually appeared on two Regents' examination papers of twenty years ago. The first is a synopsis of Longfellow's "Evangeline" and is reproduced verbatim:

EVANGELINE

Gabriel was Evangeline's feller. Evangeline was always chasing after him. When she got left behind on the shores of Arcadia she begun chasing as soon as she could. She chased him over mountains and valleys but she never got catched up with him. At last when she was thin and old, she found him laying in a poorhouse with a fever. She just had a minute's time before he died to lie his head on her

*A talk given over radio station WNYC, April 12, as a part of the weekly Board of Education program arranged by Mr. Winfield L. Rice, Acting Director of Civics.

Scanned with CamScanner

bosom and say, "Good-bye, Gabriel, I done my best."

The second is a vivid word picture of Millet's painting "The Angelus." Here it is:

THE ANGELUS

This picture was painted by Malay. It contains a man and a church steeple. The man and woman are very poor, they have been digging potatoes because they need them to live on. The potatoes look very small. Just at sunset they hear a bell ring, it is the Angellus, it means they must pray. So they bow their heads and pray for bigger potatoes.

So much for the older point of view.

And what of the present? How have we English teachers of 1933 profited by the mistakes of our predecessors? Before answering this question, we might briefly consider the aims of education. I think there are two: to provide an opportunity for individual growth and development to the end that every pupil may lead a happy and productive life, and to present means and purposes whereby each person as an individual will be enabled to render that service to the group for which nature has best fitted him. This dual viewpoint is seemingly paradoxical in that it is at once individual and social, but is easily explained by the fact that he renders the best service to society who is most highly developed according to his own natural individual capabilities. Social efficiency is now the ultimate end of education—an efficiency that emphasizes the realization of physical, moral, vocational, avocational, and civic potentialities and capabilities.

The new point of view considers the child the center of the educational universe. The teacher is no longer merely a receptacle into which the material given out the preceding day is re-placed. He is rather a counselor, an adviser, a guide who takes the pupil by the hand and directs him along the proper paths leading to the attainment of an education. The class hour is no longer considered a period wherein matter presented yesterday is re-presented in the same form and manner today. The school period is considered rather as a time for socialized discussion with the conduct of discussion transferred from the teacher to the group itself. Technique is subordinated to enjoyment. Responsibility is shifted from the shoulders of the instructor to those of the students who, in a number of years all too few, will be forced to carry on for themselves. Much more important than the massing of facts is the training for proper ideals, correct attitudes, and worth-while purposes. In other words, the new education attempts to reconcile the aim of the type of school we attended—culture—with the aim of the modern type—experience—and to train for leadership through individual initiative.

And how are these aims attained through the teaching of English in high school? My limited time prevents anything other than a very brief sketch of the most popular methods.

I might well begin by mentioning the socialized recitation in which the pupils, impelled by the social interest and need of the subject, carry on their own discussion under the guidance of the teacher. The pupils studying "Silas Marner" differ radically in their opinions regarding Marner's justification for leaving Lantern Yard when he knew in his heart and soul he was guiltless. A heated discussion arises. Some condemn the weaver for departing from the scene and for allowing himself to become a forgotten man, instead of remaining to battle for his good name. Others are just as insistent that Silas would not have received a fair trial because public opinion was against him. The wise teacher grasps this situation as a natural opportunity for debate on the morrow. The class is eager to carry on the discussion further. Sides are chosen, a chairman is appointed, judges are elected, and the stage is set for the next day's period. After the speakers have finished and a decision has been rendered on the following day, the chairman throws the subject open to general discussion. The class has thus carried on their own recitation; the teacher has served merely as a guide; the work has been socialized.

Closely allied to this type of procedure is the project method whose aim is intellectual growth through thinking and doing. Let us assume that the senior class, having just finished their study of poetry, are desirous of making an original anthology of verse—a volume which will serve as a pleasant reminder in the future of some cherished efforts in the past. Committees are appointed to decide on the mechanics of the book, its form, the types of poetry to be included, the nature of the illustrations, the editing, printing, binding, and distributing. Naturally the "give and take" of social contact will play an important part in this work, and not the least of the benefits accruing will be the experience of subordinating one's own opinions and desires for the greater good of the group.

A scheme for the individualization of instruction by encouraging each pupil to progress at his own intellectual rate is the Dalton Plan, used in many high schools in a more or less modified form. Its three underlying principles are freedom, social coöperation, and the budgeting of time—all most useful in modern society. Each classroom becomes a "laboratory" where the pupil may find proper "tools" to aid him in his work. Instead of day to day assignments as in the conventional classroom, "jobs," comprising a certain number of "units" of work, are given each week or month, and when these are finished the student is free either to pass on to some other unit of work, or to do as he wishes. The teacher becomes the pupil's helper, adviser, friend, and must not only make up the various "jobs," but check on their successful completion as well. The Dalton Plan is based on educational

Scanned with CamScanner

"piece work," a system that prevails today in our shops and factories. The more adept a pupil is at completing his assigned tasks, the sooner he reaches his goal—graduation. It is not a system that prepares for living; it is life itself.

In the past, when most of you listeners attended school, little or no attention was paid to the manner in which pupils studied. Assignments for the most part were given by chapters or pages and the process of obtaining information was a hit-or-miss one. Today not only study, but also supervised study (which in reality is supervised learning), has a technique all its own and the number of books on the subject is legion. Not only are we interested in the facts and in the manner of obtaining them, but also in the proper insights, appreciation, attitudes, habits, and moral traits which are the resultants of study. The pupil who learns to study properly develops a characteristic which will be most helpful to him in after-life—self-dependence.

A type of lesson whose interpretation has undergone a great change since the beginning of the century is the review lesson. When you and I went to school it meant a re-hash of the old material in the old way. The teacher, who had dictated at least one hundred questions on "The Tale of Two Cities" during the course of the term, slaved till three o'clock in the morning composing fifty additional ones to serve as a basis for the review lesson on the morrow. Today, we consider the review lesson one in which a "new view" is to be presented and, accordingly, make the class responsible for their own questions and answers through the medium of the socialized recitation.

Another type of lesson which is becoming more and more important in our progressive schools, especially in teaching literature, is the appreciation lesson. Because of the highly subjective nature of this type of study, no definite steps can be formulated, but the instructor's enthusiasm for his subject, careful preparation, sympathy for and knowledge of the heart and mind of youth, and understanding of the aim of appreciation, which is enjoyment, not technique, make this type of lesson invaluable.

In this little talk I fully realize that I have but scratched the surface of the infinite resources the modern teacher of English has at his command. Yet if I have shown you ladies and gentlemen of the radio audience that our aim is a combination of cultural, spiritual, emotional, and practical aims, that our material is God's masterpiece—young manhood and young womanhood—and that the glory of teaching consists in moulding this material so that the aims of education may be realized through proper method, my present efforts will not have been in vain.

GEORGE J. CRANE,
Chairman, Department of English.
Boys' High School.

HIGH POINTS

The Use of the Text-Book in Mathematics

At the interdepartment conference of the Textile and Seward departments of mathematics, held September, 1931, one of the chairmen made a plea for a more intensive and intelligent use of the texts in algebra and geometry than prevails at present.

The writer was so impressed with this idea that he has attempted to analyse (1) the reasons why we have departed from the use of the text, (2) ways of returning to the text, if desirable.

To get a perspective, suppose we go back to the late nineties. The writer's experience may be typical. We attended a small district school in the country, where one teacher in a single room instructed from thirty to forty pupils, ranging from five to twenty years of age. The various classes were called up one at a time to benches in the front of the room and recited what they had learned about the subject assigned in the previous session. The recitation was a test of text mastery.

When we changed to the academy, we found conditions much the same. In geometry, theorems were assigned to be memorized and a few exercises to be worked out at home. Both were to be produced on the blackboard the next day. In algebra certain problems were assigned to be solved. We were expected to learn how to solve the problems by examining the models at the head of the exercise.

All this tended to make the pupils *text-minded*. By this expression we mean that the pupils looked to the text's explanation of processes as their guide to success, and considered the teacher as an auxiliary to the text-book.

With the growth of our large city high schools, the teachers soon learned that if they pursued the "assign and hear plan," their pupils would fail in very large numbers. Therefore they have taken to explaining theorems and methods in geometry and exercises in algebra on the blackboard in front of the class while the pupils become, for the most part, passive recipients of this information. Sometimes the pupils write in note-books, sometimes not, depending upon the method of the teacher. Usually, there is an attempt to draw the pupils into a discussion and thus with their active participation develop definite ideas or concepts. Homework follows along the same lines. The effect of all this is to make the pupils *teacher-minded*. By this we mean that in the eyes of the pupils the teacher is the chief source of knowledge, and that the text is an auxiliary.

Under such a system, the passing of the pupil depends to a large degree upon the teacher. If the pupil is able to follow his particular teacher, and becomes interested enough and smart

Scanned with CamScanner

enough to work faithfully and intelligently, he passes. Otherwise he fails.

What is the result to date?

1. Pupils still fail in large numbers.
2. Those passing have little power.
3. The pupils receive no organized or complete knowledge of fundamentals.
4. The teacher teaches for the examination and tries to beat it.
5. Tests are largely memory tests.
6. There is a tendency toward rote work and deadening repetition.

From another angle:

1. The teacher may and often does talk too fast.
2. The pupil may daydream.
3. The pupil may be distracted by disorder.
4. The teacher cannot possibly emphasize points to suit the needs of each individual student.
5. The concepts fade rapidly because the teacher's voice is soon a memory.

The text is a *reality* that stays in print to be referred to.

When a teacher-minded pupil leaves the classroom, he leaves the teacher behind. If he imperfectly understood the exercises in class, how can he do his homework?

If, on the other hand, the pupil knows how to study theorems and methods in a text-book in geometry and model exercises in algebra, he has in permanent form, in print, to master at leisure, the necessary material for success.

The texts in algebra now in use are complete and present a body of knowledge so organized that any pupil who follows them carefully and intelligently will store up not only facts and methods, but achieve power that will be of use to him.

With abilities and principles so mastered, it will be easier and more effective to tune up for the Regents' examinations at the end of the course.

The writer is, however, not entirely satisfied with the texts in geometry he has seen from this point of view.

And now arises the larger question: How can we make our pupils text-minded in high school?

1. The teacher must believe in the ideal here held up. Such teachers will point their pupils that way.
2. Have the students read aloud in class the texts, explanations and model solutions preceding an exercise and discuss with them various points to secure greater understanding. Merely assigning for home study or silent seat work to read such and such pages is a waste of time.

This reading aloud is to be continued until the pupils show signs of reading intelligently themselves.

The manner in which this discussion is performed is all important. A hurried, desultory reading is fruitless. The pupils must be kept interested. The text chosen must be clear and detailed enough to make a complete and understandable picture.

3. Hold the ideal constantly up to the pupil and encourage him to refer to the text as a friend in need.

So we ask for a return to the text as the key to independence, as the key to strength, but under different circumstances than formerly. The teacher and class discussions are to play much different rôles. For is it not true that students of books are our real scholars?

WILLIAM HANCE,
Chairman, Department
of Mathematics.
Seward Park High School.

A Health Exhibit as a Teaching Project in Health Education

Recently, the Department of Health Education for Boys of the Seward Park High School of New York City conducted a health exhibit as a teaching project in Health Education. This school has a well equipped room for such purposes. The exhibit presented practical information in an objective manner that stressed the visual method. The project was a novel one and the exhibit as a whole was made a definite teaching procedure.

The exhibits selected were practical. They applied to the everyday life of the adolescent, and were somewhat different from that generally presented as part of the course in hygiene.

The material was arranged to appeal to seasonal interests and to stimulate curiosity in games, skills, and practices partly or wholly unknown to the pupils before this exhibit.

Below are enumerated the various exhibits together with a brief description of the nature and content of the display.

1. The Sunburn Exhibit displayed a humorously illustrated poster of a sunburned bather. Charts carried instructions for the prevention and treatment of sunburn. Samples of carron oil, creams, and other remedies were displayed below the charts.

The possibilities for disability and even serious injury were suggested in this display and stressed the need for prompt treatment. The poster and charts were made by the school Art Department and the remedies were contributed by the Good Samaritan Dispensary of this city.

2. Posture Exhibit, showing silhouetteographs of posture of three general types of pupils.
   a. Thin type.
   b. Intermediate type.
   c. Stocky type.

On the poster of each type was indicated a silhouetteograph of excellent, good, faulty, and poor posture together with a description of the components that make up such posture. This exhibit was loaned by the New York Tuberculosis Association.

3. Poison ivy was displayed out of reach of the pupils. On the same level was a potted vine of Virginia creeper. Above the plants a poster gave susceptibility statistics which stated that two-thirds of all people are susceptible to poison ivy; also that it is wise to avoid trying to find in which classification the pupil belongs. Over the ivy and Virginia creeper

Scanned with CamScanner

plants were descriptive cards so that the ivy might be easily recognized. Above these, a Board of Health illustrated poster contained a section of the Sanitary Code relative to the destruction of poison ivy, poison oak and sumac. In an exhibit case below were the immediate or emergency and the general and more specific remedies for the treatment of poison ivy. The poster was contributed by the New York Board of Health, the charts by the Art Department of the school, and remedies by the Good Samaritan Dispensary.

4. Exhibit on Care of Feet. One vital chart compared the footprints of Charlie Chaplin with those of an athlete with a perfect arch. The charts and shoes were loaned by the Scholl Manufacturing Company and the Cantilever Shoe Company.

5. Poisonous Toadstools and Edible Mushrooms. Through the kindness of the Museum of Natural History, this exhibit of poisonous toadstools and edible mushrooms, together with cards indicating the difficulty of recognizing edible mushrooms, advised against the collection of this form of food at any time by amateurs.

6. Hornet Exhibit, showing a good specimen of hornets' nest and an additional case of hornets for identification purposes. Along with this exhibit were containers showing antidotes for hornet's sting.

7. Snake Exhibit. A garter snake was displayed opposite a poisonous copperhead. Posters called attention to the essential differences between the two; again, immediate and remote were indicatd on charts. Exhibits 5, 6, and 7 were borrowed through the courtesy of the American Museum of Natural History of this city.

8. An illuminated dental exhibit of X-ray films showed permanent teeth displacing temporary teeth. Other films revealed pyorrhetic and impacted teeth. Additional films were arranged to indicate the progress of decay where there were no outward signs of destruction of teeth. Colored charts displayed illustrations of many pathological conditions of the teeth and mouth such as Vincent's angina (trench mouth) and the technique for its arrest and cure, as well as stomatitis and other similar disturbances. In a case below was the Orthodontia Exhibit. Plaster casts of teeth showed malocclusions as well as normal occlusions. Particularly interesting was the cast of a young child's teeth showing its "open" bite; alongside of this cast was another which indicated definite improvement of this condition. This exhibit was donated by Drs. H. and J. Schleifer of this city.

9. Metropolitan Life Insurance Pamphlet Display. Particularly interesting were the pamphlets on "Milk," "Tonsils," and "Stories of Health Heroes—Jenner, Pasteur and Trudeau."

10. American Red Cross Exhibit.

a. Home Nursing. This exhibit displayed in miniature the preparation of common household remedies, the care and the feeding of the sick.

b. Campaign posters relative to the Red Cross annual swimming and life saving campaign urging all to learn to swim.

c. Charts on first aid and resuscitation, together with samples of various types of first aid kits and their contents. The contents of the kits were rendered pertinent by reference to charts displayed above.

d. An insignia display of the awards given to those who pass the graded life saving tests.

e. Instructions in the technique of life saving and safety on and in the water.

11. Pulmotor. A demonstration of its use was given each period This machine is part of the school equipment.

12. Camping Exhibit. This display consisted of a tent in a setting of artificial grass with a campfire realistically arranged, imbedded in sand and rocks, electrically lighted so that it seemed aflame. How to build a campfire for cooking purposes was the objective of one of the exhibits. All the paraphernalia of a camp, cooking kit, axe, logs and so on, as well as related athletic equipment such as surfboard, archery target, bows and arrows, and even a canoe, made up the display. How to leave camp, clean up and extinguish fires was emphasized.

13. Sport and Athletic Exhibit. In display cases were athletic equipment for the following sports: tennis, badminton, squash, golf, horseshoe pitching, quoits, archery, pelota, fencing, boxing, croquet and ring toss. Exhibits 12 and 13 were contributed by Alex Taylor and Company of this city.

14. The proper method of making a sleeping bag out of two blankets with its proper location in relation to the campfire was demonstrated.

15. Milk and Nutrition Exhibit. The Dairymen's League, Incorporated, Exhibit contained the nutritive elements of a quart of milk and an interesting graph on the growth of rats, showing the effects of coffee and milk on the rats, as well as the amount of gain in weight. A display of protective foods brought home the minimum requirements for certain types of foods for the growing student.

16. Model breakfasts, luncheons, and dinners with charts of Composition of Food Materials. These balanced meals were changed daily through the period of the exhibit, thanks to the coöperation of the school chef.

17. A display emphasized the annual medical examination and touched on neglect of colds, overwork, lack of rest, and the necessity for sleep in well ventilated rooms. Other displays and posters related to mental hygiene, recreation and to the preventive program of health. Some of the posters were worded like the newspaper want ads. Pamphlets were distributed relative to the incidence and dangers of tuberculosis. These pamphlets were published by the New York City Board of Health in conjunction with the Board of Education.

18. The New York City Board of Health Exhibit consisted in part of posters relative to the dangers of contact with poison ivy, and others stressed the necessity for a preventive

Scanned with CamScanner

program for the elimination of diphtheria. Safety posters relating to the proper use of inflammable liquids and the necessity of cleanliness in relation to health, were displayed in a definite pattern. Over two thousand pamphlets were distributed which referred to food and its relation to the teeth.

19. Another display case contained a table setting for dinner with cards containing questions relative to table manners and table etiquette and their answers. This exhibit was contributed by the Home Economics Department of the school.

20. The Safety Exhibit was unusual and gave practical suggestions regarding safety in the home, camp, street, playground and the factory. Safety rules of everyday life were given through the medium of other adequately illustrated posters. This exhibit was created through the cooperation of the Travelers Life and Accident Insurance Company, American Red Cross, National Bureau of Casualty and Surety Underwriters, and the New York City Board of Health.

21. Tuberculosis Exhibit. This exhibit was loaned through the courtesy of the New York Tuberculosis Association.

22. Olympic Exhibit. An Olympic Exhibit surrounded the official Olympic poster with pictures in all sports. Among others were famous football teams in action, water polo, wrestling groups, and remarkable photographs of soccer and diving. In addition, there was an athletic form display of the various track and field events. These form pictures illustrated famous champions in action, indicating that their championships were based on real form and that they were not freaks, and that athletic success came through training. Among the champions were Thompson, Simpson, Osborn, Bracy, and Paddock. This exhibit was made possible through the courtesy of Mr. Daniel Ferris, Secretary-Treasurer of the Amateur Athletic Union of the United States, the *New York Times*, and the Acme Newspictures Incorporated of this city.

23. The final item consisted of twenty-four sheets which we distribute for pupils' information in connection with our hygiene activities whenever needed or requested by the pupils. They refer to the subjects such as athlete's foot and its treatment, constipation, boils, acne, overweight, flat and weak feet, general directions relative to the treatment of postural defects, and additional leaflets on dandruff, colds, bathing and other allied subjects.

At the beginning of each hygiene period, the instructor with a printed program in hand took his class to the exhibition room, led the pupils through the exhibits, explaining wherever necessary the message intended, and gave necessary demonstrations. This lasted twenty minutes. For the remainder of the forty-minute period, the pupils moved about at will as their interest and curiosity prompted, while the teacher answered questions asked by the pupils.

During the week of the exhibit, the

English department coöperated in the project by making the various exhibits the subjects for themes and assignments.

Two weeks after the exhibit, a true-false test was given to 1,437 boys in all grades to determine if the information contained in the various exhibits was retained by the pupils and to discover what carry over, if any, had occurred. As the total register of boys during this term was 2,049, the results of this test should be reliable as to the effect of this exhibit. Below is given a copy of the test. Each of the thirty questions relates to a definite part of the exhibit, and is designed to minimize guessing and to require specific knowledge for a correct answer. The resulting scores, term by term, and a summary of the scores for the school as a whole are shown in the subjoined tables.

The scores of the test after statistical treatment indicate that there was a definite carry over and that the exhibit served the purposes for which it was created.

The planning of the exhibit and the collection and compilation of material was largely done by Mr. Adrien B. Paret and Mr. Alexander G. Rudel of the Health Education Department for Boys in conjunction with Mr. Herbert M. Ross, the chairman of the department. Effective coöperation was rendered by the electrical, chemical, and biological branches of the school's Science Department, the English Department, the school lunch room, the school's workshops, and the custodial force. The scoring of the tests and their statistical treatment were completed by the author.

Health Exhibit Follow Up

Questionnaire

To the student: If any of the following questions are true, cross out the letter "T" with a line: if it is false, cross out the letter "F." Every question must be answered.

T F 1. Poison ivy can be recognized by its five leaves and black berries.

T F 2. The best way to make a bed for camping out with two blankets is to lay a folded blanket on the ground and wrap yourself in the other one after reclining on the first blanket.

T F 3. The pulmotor is a useful machine to revive people who are unconscious from submersion in the water or overcome by illuminating gas.

T F 4. A fast ball game played in Canada is called jai-alai.

T F 5. Milk is a nearly perfect food.

T F 6. Temporary teeth should not be filled as they fall out anyway.

T F 7. Exercise cannot help weak feet or fallen arches.

T F 8. Arches and supports cure flat feet.

T F 9. The irregular bite of some children—called malocclusion—cannot be remedied.

Scanned with CamScanner

T F 10. Food and nutrition are closely related and concerned with the teeth.

T F 11. Most mushrooms are edible and can be eaten.

T F 12. The proper manner of distinguishing the harmless from the poisonous snakes is by the hiss and color.

T F 13. The appetite can always be trusted as a guide to food that is well balanced in all food elements.

T F 14. Hornets' nests are brown and are found in low bushes.

T F 15. The best immediate treatment after contact with poison ivy is to wash the exposed parts with common yellow laundry soap and gasoline.

T F 16. A good lotion for poison ivy is lime water.

T F 17. Form has little effect on a champion's performance in track and field athletics.

T F 18. The annual health examination is of great value in the prevention of illness and disease.

T F 19. Lacrosse, water polo, fencing, and squash tennis are mild, inactive games for a young man.

T F 20. Tuberculosis is the great foe of youth and is contagious.

T F 21. Night air is injurious to the sleeper.

T F 22. Pressure between the wound and the heart, or above and below the wound, is a good rule to follow in the arresting of the flow of blood.

T F 23. It is useless to continue artificial respiration after one hour.

T F 24. Always put out fires and clean up around camp sites in order to avoid forest fires.

T F 25. Regular use of the tooth brush does not aid in the preservation of the teeth.

T F 26. The best way to get all vitamins into the body is by taking cod liver oil.

T F 27. A quart of milk daily is needed by a growing child.

T F 28. Oil placed on the skin before exposure does not reduce sunburn.

T F 29. In a model shoe, a straight line may be drawn from the inner side of the heel to the toe.

T F 30. The best way to walk along a country road is against the traffic.

In marking, deduct 3.5% for each question answered wrong.

ALEXANDER G. RUDEL.
Seward Park High School.

Vitalizing the Teaching of Elementary Business Training

Business Training is a young and favored child in our curriculum. As such, it is not definitely "pinned down," but is in a tentative stage, subject to improvement as we see the need for it.

Because the subject is so new, many questions have arisen in the minds of the people teaching it. How can we teach the duties of the Stock Clerk or the Receiving Clerk to a class of fourteen-year-old boys and girls who are not interested in these clerks? How shall we make them feel the need for the study of these topics, uninteresting in themselves? I have tried a method which I think has aroused a felt need in the minds of the students. Let me give an illustration.

Our class studied the sales-clerk by turning the classroom into a department store. The teacher was relegated to the background. The students took turns at being the salesman or the customer. These student sales-clerks actually went through with the entire sale, from the tactful approach to the wrapping of merchandise. As a department store, our classroom had many shortcomings. None of the students, however, were so unimaginative that they could not visualize pens when the salesman said: "These are very fine pens. We are having a special sale on them." After our salesmen concluded their sales, they made out the sales slips on the blackboard. The forms had been drawn at the beginning of the period. During the progress of the sale, the rest

Scanned with CamScanner

of the class was busy listening and noting points for criticism. A class discussion followed each sale.

The criticism was based on the following points:

1. Manners and speech.
2. Interest in the customer.
3. Creation of desire in the customer to possess the merchandise.
4. Closing the sale.
5. Making the sales slip—form and legibility.

Most of the salesmen and salesgirls were very good, although a number made flagrant errors. Few errors were overlooked by the critics, who had many suggestions to offer. The customers were not criticized since real life situations were desired and the "customer is always right." We certainly did get a variety of customers —sweet, vinegary, hesitant and miserly. I think that we had almost as many types as any department store.

It is true that certain aspects of the subject had to be taken up in class to a greater extent, for they were only touched upon in the sales. This was relatively simple since we had the actual sales to which we could always refer. There was correlation with many subjects in the study of the salesclerk. The speech of the salespeople had been corrected in the criticism. The calculations on the sales slips made for training in arithmetic. The discussion of appearance and manners was an excellent opportunity in which to consider the effects of lipstick, chewing gum, high heels and flashy clothes.

Of course, the sales-clerk as a topic has many possibilities, but what is done when the shipping clerk or file clerk is studied? The shipping clerk was especially difficult to teach, since I have classes of boys and girls. We all know that girls are rarely, if ever, shipping clerks. Yet they have to know how to pack and mark goods, the methods of shipping, and so forth. The topic was motivated by the study of the history and means of transportation. Since our classroom in Curtis High School faces New York Harbor with its freight yards, incoming and outgoing boats, we had the opportunity of seeing all the means of transportation. Most of the information was given by the students, and I was delightfully surprised to discover their varied knowledge. After this, there was a class discussion of the factors upon which the choice of the means of shipment depends. In order to learn the duties of the shipping clerk, and the meanings of certain terms, such as consignee, bill of lading, route and charges prepaid, the class traced shipments from their sources to the destinations.

This method is far from new. It is just another variation of John Dewey's theory of preparation for life. In the examples given, it was done by placing the students in imaginary business situations. It is so simple to do this, for the grocer on the corner may be utilized, or the milkman, or any of the businessmen with whom the students come into contact. Thus deadening facts become alive in the concrete situation, and the students feel a need for the study of a truly vital subject.

FRIEDA WEINSCHEL.
Curtis High School.

Course of Study for Mathematics Honors Classes

The honors classes at Manual Training High School are made up of the pupils whose average the preceding term in the same subject was 75% or better. In a recent study undertaken by the Mathematics Department the matters of content and method of instruction for honor classes were given careful consideration. The following is a description of additional content which, it is hoped, will be incorporated in the course of study for these special classes.

In elementary algebra, when we teach fundamental operations and factoring in our ordinary classes we are forced to limit ourselves to integral coefficients. In the honors classes we plan to include fractions and decimals in both these topics. Furthermore, more difficult fractional equations than those taken in the ordinary classes are to be included. In our work with exponents we shall not stop with numerical exponents, but go on to literal ones in order to train these pupils in the ability to generalize.

Another topic in the elementary algebra syllabus is numerical substitution in literal equations. Under this heading we have the opportunity to give the pupils a background of the actual meaning of some of these literal equations which are formulas taken from geometry and physics. It would be very difficult to do the same thing in any average class. However, in the slower classes we are forced to spend so much time on drill and repetition that we cannot allow ourselves the time to go into the more interesting phases of the subject.

Graphic solutions of problems, such as time-rate-distance, work, lever problems, all of which are now solved algebraically, offer additional topics to be added to the elementary algebra syllabus because of their practical value and their interest to the student.

In plane geometry we compiled a list of supplementary exercises taken from a different text-book and arranged by weeks to correspond with our present syllabus. This list does not involve any new theorems in geometry. It is intended as illustrative material for the topics in the present syllabus, and as an aid to a better conception of geometric thinking. These exercises are to supplement, or in some cases to replace, some of the exercises in our own text. Although they are all valuable, lack of time will necessitate many omissions from this list. The number of exercises studied will depend upon the calibre of the individual class and will therefore be left to the discretion of the teacher.

In compiling the list we looked for exercises possessing the following characteristics:

First: Exercises which do not lend themselves to the stereotyped methods and mechanical aids with which we are forced to arm our weaker students, i.e., exercises the solutions of which

Scanned with CamScanner

involve the elements of discovery and geometric intuition. In such problems success is accompanied with much greater satisfaction and joy to the student than the solution of exercises which require merely the application of a specific method. It is the latter type to which we must limit ourselves in the non-honors classes

Second: Applied exercises taken from the fields of physics, chemistry and astronomy. These are exceptionally valuable in that they offer such clear evidence of the close interrelation between mathematics and the physical sciences. Here again, these exercises are not too difficult to be enjoyed by the average pupil.

Third: Exercises involving functional relationships; for example, changes that take place in certain parts of a figure when certain other parts undergo given changes, or the effects on areas when one or both dimensions are varied in some specific way.

In intermediate algebra, since the present syllabus is much too crowded for our ordinary classes, the most desirable accomplishment that can be hoped for is to cover this syllabus more thoroughly. For an exceptionally fine class, however, the following additional topics are suggested:

1. Graphic addition and subtraction of complex numbers. In advanced courses in physics students will find practical applications for this topic.
2. Graphic solutions of problems.
3. The solution of simultaneous equations in three unknowns.

In trigonometry we hope to be able to add to our present syllabus one or more of the following topics:

1. The use of the slide rule, which many of our students will find valuable in their later work in mathematics.
2. Plane sailing, a practical and interesting application of trigonometry to navigation.
3. De Moivre's theorem, the proof of which offers an excellent illustration of the beauty and elegance of mathematical thinking.
4. Construction of logarithmic tables, to prevent the students from using blindly one of the chief instruments in mathematical calculation.

In advanced algebra, we have added a unit of statistics, which are used so extensively now in practically every field of knowledge that an intelligent appreciation of the subject is highly desirable. Another topic to be added here is a little differential calculus as applied to maxima and minima and to the turning points of the graph, and also differentiation as applied to the laws of motion, velocity, and acceleration in physics.

In general, the chief aim underlying these additions is to teach the subject more intelligently, instead of serving as drill masters as we do in our ordinary classes. In this scientific age mathematics is necessarily one of the most vital subjects in the curriculum. It is unfortunate that in the average classes our efforts to get students to pass Regents' examinations are accompanied with so many difficulties and obstacles that we have not the time for anything but the barest outline of the syllabus. In the honors classes we should be able to do more justice to our subject.

ROSE SHORR.

Manual Training High School.

Method of Instruction in Mathematics Honors Classes

Pupils who receive an average of 75% or over in any grade of Regents' mathematics in Manual Training High School are segregated the succeeding term in special classes, known as honors classes. Since these honors classes are composed in the main of students who eventually go to college, we try to adapt our methods of instruction with these groups to the methods generally employed in college. Our aim is to conduct each lesson so as to bring the student more to the foreground, challenge his independence in thought and preparation of the work. The teacher conducts the lesson so as to stress rationalization. He puts more emphasis on functional thinking and less on mere mechanical manipulation of numbers. He tries to get the pupil to be critical of his own work and that of his classmates.

As the pupil is led to build up the new proof or solution by analysis he begins to realize that more is expected of his initiative. He, himself, must be satisfied and convinced. In the honors classes original exercises are left to the student to be done as homework. The teacher takes up a similar type of exercise in class and lets two or three of the pupils guide the rest of the class in arriving at a successful conclusion. But the homework exercises must be tackled by the student without a dress rehearsal.

At first the pupil resents having to do so much for himself. He is so accustomed to being coddled that he is at sea when left to his own devices. After a little success, however, he begins to realize that he is gaining in power. After working at an original exercise in algebra, geometry, or trigonometry for the major part of his allotted time, when the solution suddenly does sprout he experiences what is known as the "inventor's thrill," which makes him feel like an Edison or an Einstein, puts him back in good humor, and amply repays the difficult struggle.

Sometimes the lesson takes the form of organized study. The teacher merely makes the assignment for the following day's homework and leaves the students to their own devices for fifteen or twenty minutes. Then the teacher interrupts the work and there is a flood of questions on the various exercises. These questions are answered, whenever possible, by members of the class. Critical judgment is again emphasized. The wish to do as well as his neighbor will stimulate greater effort. At the same time the teacher realizes where the main troubles exist and builds a lesson to be given in the near future, definitely planned to help overcome these difficulties.

Occasionally an entire period or part of a period is given over to teach "How to Study." This is needed

Scanned with CamScanner

especially by those preparing for College. Taking some particular phase of the work as an illustration, the teacher by a series of skillful questions gets the class to tell just how the preparation and successful solution should proceed, the proper use of text index and dictionary, where the pitfalls occur and how they can be overcome. This is intended to cultivate in the pupils the habit of relying on their own resources and ingenuity.

As the term advances the classes are given longer stretches of the supervised study so that eventually the pupils build themselves into college material with a better chance for success there.

In the regular classes there is so much need for drill, repetition, and review that it is practically impossible to give even the fractional part of a period to supervised study. It is almost always necessary to do the greater part of the new assignment in class. The little time that is left of the period is used for recitation and review.

The assignments for homework in these honors classes are more thought-provoking. In the non-honors classes we find it necessary to repeat a theorem or exercise for several successive days, but with the honors group there is not so much repetition of assignment. Time is thus afforded for more original work and more difficult problems and for correlation of mathematics with the physical sciences.

For the time being, we are using the same mid-term and final tests for honors pupils as for the others in the same grade. Eventually, we hope to conduct recitations and make home-work assignments in such wise that we shall no longer fear to face our alumni who return to see us during their short vacations from college to inform us that we do too much for them at Manual, thereby leaving them unprepared and unfit to digest the college menu.

JEANETTE S. GOLD.
Manual Training High School.

Teaching Something About Engraving in the Advertising Course

In teaching Advertising in the high schools it is proper to include in the course some work on engraving.

In this connection the teacher undoubtedly has access to a number of line cuts and half-tones that have been used by the school newspaper or magazine. While these can be passed around and explained, it is so much better to obtain prints of the engravings right in the classroom. All that is needed is some printer's ink, an ink roller, and a piece of glass on which the ink can be spread. The cuts can be quickly inked and pressed against some mimeograph paper. A fair amount of pressure is all that is needed to transfer the image.

A much simpler means of printing is possible. Press the engraving on to a well-inked stamp pad. Then firmly lay the cut on to a piece of paper. This is as simple as printing your name with a rubber stamp.

While the students will enjoy the experience of inking and printing the cut by hand, there is a further opportunity of making the work still more attractive. This is by means of permitting them to do the entire job, from beginning to end, by themselves.

Of course they cannot work with metal. Instead they have to go back to the first step, historically, in printing. Only instead of using wood, we find it easier to work with linoleum.

The work consists of the following steps:

1. Prepare the sketch or advertisement on paper.
2. Transfer the above to a sheet of transparent tracing paper.
3. Reverse the tracing paper. (In printing the reversed part comes out as in the original.)
4. Lay the reversed tracing paper on the linoleum block with a sheet of typewriter carbon paper between both.
5. Go over the tracing with a pencil. The sketch is carried over to the linoleum.
6. Our next task is to cut away with the proper tools those parts of the block which are not to be printed.
7. When the engraving work is completed, the block is inked. Only the uncut surface takes the ink, therefore only this surface prints.
8. After the first print is made examine it for defects. You will thus find that you can improve the cut by going over certain portions with your tools.

Battleship linoleum should be used. A number of students may be assigned to go around to some of the neighborhood linoleum shops. They can probably pick up left over scraps suitable for this work at a very low cost. It should be warmed slightly before using, to get the best results.

The tools can be bought at a very slight cost. The cutting blades are available at a size comparable to a penpoint and very conveniently fit into an ordinary pen holder. They can be bought for $1 per dozen so that for a few dollars the class is supplied with tools which may last for several years. I am referring here to the "Tif" blades.

In inking, spread a little printer's ink from the tube on a piece of glass. Use the roller, going over the ink until it is thoroughly spread out. Apply the roller to the linoleum first in one direction, then in the other.

Lay the block on the table, the inked portion upward, place a sheet of paper on the block, and apply pressure. Work the fingers over every part of the paper to get the best print possible.

Pan American Day Festivities in New York

Pan American Day, an annual occasion set aside by presidential proclamation in each of the twenty-one American republics, was celebrated this year for the third time. Nevertheless, the significance of this day, dedicated to the ideal of inter-American friendship, has already, so soon

Scanned with CamScanner

after its institution, penetrated into the consciousness of thousands of students in the City of New York. If one asked for evidence of such a state of interest in inter-American relations among our student youth, especially in the cultural phase of Pan Americanism, the manifold activities of an educational nature carried on by students in connection with the observance of this new ALL-American holiday would be ample to indicate that there has really been achieved an understanding, an appreciation and a sympathetic comprehension of what the Portuguese and Spanish speaking Americans signify in the general scheme of human civilization and especially in the panorama of the New World.

However, in order to measure fully the value of these festivities and the students' participation in them, it is essential to bear in mind that they are the direct outgrowth of an all-year-round program of inter-American education carried on through the forty-three chapters of The Pan American Student League of New York, which now includes in its ranks almost all of the senior high schools of New York in addition to two of its colleges and an alumni chapter, and has already made its entrance into the junior high school system. This League functions actively throughout the school year. It does not limit itself to several gala occasions that occur during the year. These merely represent certain high points in its annual career, that bring together into one assembly large numbers of students from every part of the city. Such gatherings are its city-wide conventions, held once each school term, in May and December. These meetings of the representatives of the chapters of the League, constituting its Student Council, followed by public sessions or luncheons at which many other student members and their friends usually attend, are today the Greater City's outstanding forum on Pan Americanism. There is no other body carrying on this educational inter-American program here on a scale approaching that of the League's work in the high schools and other educational institutions.

Credit for guiding and encouraging this extra-curricular activity, comparatively new in New York, is due the Director of Modern Languages in the High Schools, Mr. Lawrence A. Wilkins, and to the corps of faculty leaders, each of whom is doing his or her share most devotedly in widening the American horizon of our students as a contribution to the development of minds capable of grasping the problem of international life, that are so rapidly becoming more tangible than ever to each and every individual in our own national community as everywhere else on the earth. The faculty leaders include not only teachers of Spanish but also those of American history. To emphasize the fact that inter-American relations concern all Americans, the Pan American Clubs, constituting the League, are conducted in English, so that there may be no language barrier. Of course, study of the Hispanic civilization of America and the cultural life of Portuguese-speaking Brazil in a variety of entertaining and interesting methods is the program of each of these Clubs.

This year, as on previous occasions, the League held its Pan American Day celebration in coöperation with The Pan American Society of New York, under the chairmanship of Mr. John L. Merrill, the Society's president and a leading figure among the country's foremost Pan Americanists. Due to a conflict of the official date of April 14 with the first day of the schools' Easter Vacation, our exercises as well as those of the Society were held on Tuesday, April 11. There was an essential difference, however, this year in the character of the celebration. While heretofore the League members came as the welcome guests of The Pan American Society, listening to their program, this time the distinguished members of the Latin-American Consular Corps in New York and the eminent ladies and gentlemen of The Pan American Society were treated to a splendid student interpretation of the Spirit of Pan American Day given in a series of dramatic and musical numbers. Officially, The Pan American Society was the host, generously placing at the disposal of the League the magnificent Grand Ball Room of the Hotel Commodore, which was most appropriately decorated with the colorful banners of the twenty-one nations of America. The Society also used its good offices to obtain the coöperation of the 16th Infantry Band of Fort Jay, and of a troop of Boy Scouts of America to raise the colors of the American republics for a salute by the audience as the corresponding national anthem was played by the military band.

The student portion of the day's program was preceded by a luncheon of The Pan American Society, at which Mr. Lawrence A. Wilkins represented the schools. The luncheon guests were addressed by Hon. Enrique de Ruiz, Mexican Consul General; Hon. John Bassett Moore; Dr. Jacobo Varela, Uruguayan Minister in Washington and Hon. José Richling, Consul General of the same Republic and dean of the Latin-American consular corps here. Mr. John Merrill presided.

At 2:00 p.m. the student celebration opened in the Grand Ball Room, which was filled to its large capacity with the rising generation of an All-America-minded youth, pledged to bring closer to realization Simón Bolívar's dream of an America united in friendship and inspired with a New World Spirit for peace and harmony among the nations. The preparation of this program, in which several schools participated, was ably managed by Mr. David S. Goldberg, Faculty Leader of the Pan American Club at Samuel J. Tilden High School. Mr. Wilkins and Mr. William P. Flower, Secretary of The Pan American Society, worked out together the schedule of quotas for the schools invited to send student delegations.

The following program was received with enthusiastic plaudits by the audience, which included the con-

Scanned with CamScanner

suls, members of The Pan American Society and their friends as well as the members of the Student League.

1. "Argentina" — By Students of Samuel J. Tilden High School.
   Prepared by Miss Ethel Lehrer.
2. "Lo Que Significa el Panamericanismo Para Un Estudiante Hispanoamericano" — Address by Federico de Córdova, First Vice-President of The Pan American Student League of New York.
3. "Cuba" — By Students of John Adams High School.
   Prepared by Miss Selma Schulman.
4. "What Pan Americanism Means to a North American Student"—Address by Miss Marie Hammer, Member, The James Monroe Chapter of the League.
   Mr. David Rosenblum, Faculty Leader.
5. "Mexico"—By Students of Curtis High School.
   Prepared by Miss Elizabeth Eakin.
6. "Songs of Brazil"—By Miss Yolanda Norrisa (Soprano).
   Courtesy of The Consulate General of Brazil.
7. "Award in the Chile-American Association Essay Contest"—By Col. A. K. C. Palmer, Director of the Chile-American Association.
   Winner: Herman Slotkin, of the Samuel J. Tilden Chapter.
   Mr. David S. Goldberg, Faculty Leader.
   Prize: $25.
8. "Greetings to the Pan American Students" — Dr. Sebastião Sampaio, Consul General of Brazil in New York.
9. "Seeing the Other Americas"—Address by Edward Tomlinson, Contributing Editor of *Collier's Weekly*.
10. "Salute to the Flags of the American Republics"—Boy Scouts of America Raising the Flags.
    National Anthems by 16th Infantry Regiment Band, Fort Jay.

In addition to this city-wide celebration by the League in coöperation with The Pan American Society, each school held its own exercises under the auspices of its local Pan American Club. As the dates naturally varied with conditions in each of the schools, it is nearer to the truth to say that in New York we have a Pan American Month rather than a Pan American Day. To give in detail each of these programs would require much more space than is available for this purpose. However, the following are cited because of their interesting character and because they can serve as models and suggestions for faculty leaders of clubs and teachers who may have occasion to supervise such programs.

AT BUSHWICK HIGH SCHOOL—MR. LOUIS BERKOWITZ, FACULTY LEADER

Assembly Program, April 12—Miss Rose Scheick, Chapter President, in charge.

1. President's Pan American Day Proclamation — Read by Harold Vogel.
2. Dr. Butler's Idea of Pan Americanism—Rosario Scatturo.
3. Tango—Danced by Josephine Pizzinger and Morris Morrocco.
4. Current Events in Latin America —Reviewed by John Michaelis.
5. South American Melodies—School Orchestra.
6. Latin-American Idea of Pan Americanism—Adele Sloman.
7. Latin-American Songs—By Members of the Bushwick Chapter.
8. Pageant of National Anthems—Miss Kulick at the Piano.

AT DE WITT CLINTON HIGH SCHOOL. PROGRAM ARRANGED BY MISS R. FREUDENHEIM AND DR. I. MICHAEL LEVY

Assembly Program, April 24.

1. Scriptures.
   English by Major C. D. Frank.
   Spanish by Rafael Gold.
2. Salute to the Flag.
   English by Assembly.
   Spanish by Frank Castaldi.
3. América — Sung in Spanish by Spanish Glee Club.
4. Scenes from Don Quijote — A Marionette Show Directed by Dr. Levy.
5. "Moral Disarmament" — Address by Mr. Edward R. Murrow, Assistant Director of The Institute of International Education.
6. The National Anthems of the American Republics — Mr. Williams, Organist.

AT HIGH SCHOOL OF COMMERCE—MRS. LEAH KAHNHEIMER, FACULTY LEADER

Chapter Meeting Program, April 13—Mario A. Rodríguez, President.

1. Meaning and Significance of Pan Americanism—T. Hammerman.
2. National Anthems—J. Politi at the Piano.
3. The History of Pan Americanism —By S. Kritz.
4. Latin-American Selections on the Harmonica—By A. Canales.
5. Argentina's Educational System—By B. Defrin.

In Evander Childs High School the celebration of Pan American Day had to be set ahead to May 5, because of the intervention of a mid-term examination schedule and the Easter vacation. However, this choice of a date is as original as the idea embodies in the elaborate program developed by the Evander Childs Chapter under the leadership of Mr. G. Torres Colón in coöperation with the Department of Social Sciences, under the chairmanship of Dr. Ernest D. Lewis, who has given splendid and able direction to the spread of interest among students not reached by the Spanish Department. Miss Harriet Proctor, Chairman of the Spanish Department, puts all the resources of her organization at the disposal of the Pan American Club and therefore it presented a program of unusual interest and content, including an address by the Adviser on Inter-American Relations of the All-Nations Association, Mr. Philip Leonard Green, on "New Pan Americanists." In addition the program

Scanned with CamScanner

featured numbers of Latin-American music and talks on various Hispanic-American themes by members of the Club, presided over by Lucille Horowitz. Dr. Lewis spoke at the close. This meeting program was amplified by special programs in the recitation classes of Mr. Colón, S. Weinstein, and Mrs. Adele Mazzoranna.

Honorable mention for programs revealing student initiative as well as capable faculty direction is also due the following schools: Port Richmond High School, Mr. Bruno G. Mattei, Faculty Leader, held its celebration on April 7 and staged a Romería with typical Hispanic-American setting. Under the leadership of Miss Emma Dolgin, co-Leader of the Seward Park Chapter, the Club gave a program of Latin-American dances in full costume, prepared by the club members, and music. The outlying borough of Richmond is represented by another active chapter at Tottenville High School under the leadership of Mr. M. P. Wallace. A program of music, talks by students and a flag pageant featured by the Pan American Day exercises.

JOSHUA HOCHSTEIN.
De Witt Clinton High School.

The Teacher and Crime Prevention

A short time ago many Civics teachers were invited by the Police Department of New York City to see the police line-up. The inspector who questioned those who singly or in groups ascended the platform tried to impress upon the teachers present the fact that many of the offenders were boys and men who had been through elementary and high school.

Few of those present, I dare say, left the room feeling that they were personally responsible for the wrong-doing of these young men who ranged in age from 19 to 25. And yet there must have been some among the 18 who were interrogated who at some time or other were the black sheep in school. What can be done to minimize crime through school efforts?

Let the writer cite a case of two. Let the reader draw his own conclusions.

John had just entered high school. He was 15 years of age, 5 feet 11 inches in height. He was not as bright as the other boys in his class, although he tried hard to keep the pace. Being given certain extra-curricular responsibilities, he attended to them remarkably well, but failed two subjects the first marking period. His official teacher saw his report card but did not reprimand the boy. One of his subject teachers asked the official teacher why this boy was permitted to do the extra-curricular work and suggested that the extra duty be discontinued and the boy persuaded or forced to do his school work. This was done. The boy became morose, did less school work and ultimately quit school.

This is not a condemnation of the teacher. It is written in the hope that some light will be thrown on the method used in this and many other instances. The writer firmly believes that in instances of this sort an appeal to the sporting instinct would have produced far better results, and when we say sporting instinct we do not mean to be sentimentalists. To be exact, here is a suggested method of attacking the problem.

John is asked (not after, but during school hours), "Won't you let us take you off the team until you can catch up with your studies? If you can catch up by the next marking period, you will not only be allowed to play ball again, but you will also be allowed to join the Science Club."

The writer has tried and found this procedure to produce good results. Many boys and girls need treatment before they ask for "another chance." To recognize or diagnose each case, take the time to treat it and get the satisfaction that comes from seeing the boy or girl prove the trust placed in him or her, is in itself pay enough. Don't you think so?

LOUIS FUERST.
Jamaica High School.

An Experiment with Third-Term Latin Students

I have long been of the opinion that, if only our Latin students—whether of normal or of sub-normal ability—could be made to pursue their endeavors under circumstances conducive to inspiring in them not only a feeling of pleasure consequent on some definite, worth-while achievement, but also a profound conviction that, because of the indissoluble connection of their studies with the ordinary experiences of their daily lives, they are, at no moment of their task, engaged in acts of impractical value, a revival of interest in classical learning would almost immediately be engendered in our secondary schools and in our colleges. Despite this long-standing opinion, however, it was not until September last that, obtaining for the first time what seemed material appropriate to my purpose, I resolved to perform an experiment calculated to determine the tenability of my view.

Instead of following the customary procedure of reading, with the class, the story of the Argonauts at the beginning of the third term, I decided to have the students make an acquaintance, at the outset, with one of the enchanting stories in the new text-book, "Second Latin Book" (by Ullman and Henry), that had just been given to them. Past experience had taught me that it was impossible—nay, even hopeless — through the medium of the story of Jason's adventure, to develop in the boys and girls a mastery of the correct approach to a well-balanced Latin sentence. For one thing, even the brighter students were found to resort to "cribs"; and, of course, a teacher's efforts at explaining the Latin sentence structure are rendered utterly null and void, if the students have determined, in the meantime, to pin all their faith and hopes on these reprehensible makeshifts. Moreover, I had become satisfied that the very story of the adventure supplies the average high school boy or girl with none of the "*thrills*" which so often—alas!— com-

Scanned with CamScanner

prise his or her only adolescent quest. Again and again the boys have said to me that the plot seems "unreal," "not true to life." Well, here in their new books at last, I felt, was to be found an enchanting story, one that would readily appeal to them; for does it not portray student life, the very kind of life that they are now living, the very body of experiences through which they are passing? Furthermore, not only did it lend itself to a systematic presentation of the grammatical constructions to be studied during the term; but, in the absence of "cribs," it provided the students with an excellent opportunity for independent and honest labors.

As the term proceeded, I discovered that nearly all of the students found increasing joy in their efforts. To their pleasant surprise, the study of Latin seemed not a source of fear and worry, but of unalloyed delight. They were happy at the thought of accomplishing day by day for themselves something unmistakably worth-while; and this accomplishment was combined with the still more enjoyable circumstance that they recognized, in the deeds of Publius and Furianus, an almost faithful reflection of the daily round of student life of this as of other ages. They feasted—in imagination, to be sure—in the Athenian cook-shops with these two youths whose parents had sent them from Rome to study with the illustrious rhetoricians and philosophers in the Attic seat of culture. How sympathetically they read the letter sent by one of the boys to his parents with a gentle request for ample funds with which to entertain his classmates—yes, and even his teacher! The event, however, that evoked their greatest enthusiasm was the "hazing" which the two Roman boys received at the hands of their fellows at the opening of the school term. Natural enthusiasm! Unquestionably; for what sophomore does not delight either in "hazing" a freshman, or, at least, in witnessing the "hazing"? In short, the Latin period became an active part of the everyday life of these third-term students.

Taking advantage of the keen interest that the boys and girls had been manifesting in the lives of the Roman students in Athens, I sought gradually to direct their attention to the vehicle through which the story found expression. The idea was constantly impressed on their minds that thought can be enriched and illuminated only in so far as it finds expression in elegant, melodious, and explicit language. Latin, I pointed out, is admirably fitted, in view of its inherent characteristics, to impart to the thought which it conveys such beauty and lucidity as will cause the thought not only to sound agreeable to the trained ear but also to persuade the minds of its hearers. In other words, I endeavored to convince the boys and girls that a great part of the pleasure that they were deriving from the narrative was to be attributed to the inherent genius of the Latin tongue.

This naturally aroused in them a desire to examine some of the characteristics of Latin that had hitherto been exerting upon them a marked—though unconscious — influence in their appreciation of the narrative. Thus arose studies of such topics as:

a. The Concreteness of Latin expression;
b. Its Lucidity;
c. Its Distinctness and Directness;
d. Its Precision;
e. Its Logical Character;
f. Its Realism;
g. The Embodiment of the Writer's or Speaker's March of Ideas in the Latin Word Order;
h. The Detached Sentence;
i. The Period.

While, in these studies, we made ample use of both the narrative before us and the exercises based thereon, I had fully resolved on introducing the boys and girls to Caesar's style. I wanted them to realize that their ability to *think in Latin*—which is the great *goal* of their study—depended entirely upon their diligent study and thorough mastery of the best Roman models. In this connection, it was important to them to understand clearly that, while the Latin of modern authors *might* be good, the Latin of Caesar and Cicero was *bound* to be good. After careful consideration, however, I decided not to introduce them directly to Caesar but, in their Prose Exercises, to have them translate into Latin English versions adapted from Caesar. In order to do effective work with these versions, they were made to study practically the entire vocabulary required for the fourth term. My hesitancy to have the students read Caesar directly was due to the fact that I feared that one or two who had not fully developed a feeling for Latin mode of expression might have been tempted to make short work of their difficulty by resorting to the very "cribs," the use of which I was trying to forestall.

I cite a single example to illustarte our study of the characteristics of Latin style. The students were asked to render in Latin the following passage:

> The chieftains of the state as well as the three sons of the king himself were received as hostages. All the baggage was delivered up from the city. Then Caesar received the enemy into surrender.

Only a period, it was explained, was to be used. The following steps were then carefully gone through:

a. Selection, as the *Principal Clause* of the Period, of *the last event in respect to time;*
b. Selection, as Subordinate clauses to be rendered as *Ablative Absolute phrases* or as *Temporal Clauses,* of all sentences describing events *prior to* or *contemporaneous with* the Principal Clause;
c. *Omission of such conjunctions* as were rendered unnecessary by the re-phrasing of the passage;
d. *Giving emphasis and distinctness to the subject* by placing it at the *beginning* of the Period, *not* in the *Ablative Absolute* or in the *Subordinate Clauses.* "Caesar," therefore, the logical

Scanned with CamScanner

subject of the entire passage, was to be put at the beginning;

e. Writing the Subordinate Clauses or phrases in their *logical time sequence;*

f. Re-phrasing of the expression "c h i e f t a i n s" as "*the first* (men)"; also changing "*as well as*" to "*and also.*"

This preliminary preparation having been completed, the students could then proceed with the translation proper:

> Caesar, obsidibus acceptis primis civitatis atque ipsius regis tribus filiis, impedimentis omnibus ex urbe traditis, in deditionem hostes accepit.

One result of the students' interest in Latin, consequent on our unusual method of approach to it, was that on Friday, December 16 last, the Latin Club, comprising many of the third-term students, presented in the auditorium a play written by one member of the third-term class. This play, performed as part of the celebration of the Saturnalia, dealt with the experiences of an American student who was forced, through circumstances, to go to Rome (for the purpose of the play, in its ancient setting) to imbibe Latin culture. It was excellently executed, and revealed how much knowledge the author had derived from his Latin study.

A still more important result—I might almost say, an astounding result—was the fact that, in a contest for a silver medal, I gave to six of these third-term students the Regents' examination for last January, and the highest mark attained was 90½. The competitors were not aware, of course, that they were answering Regents' questions; for, shortly after the beginning of the Regents' examination, I had hurriedly made typewritten copies of all the questions—except the last, dealing with historical matter—, which I gave to them.

It will be recalled that I stated, in an earlier paragraph, that the class was not permitted to read any part of the "De Bello Gallico." The students, therefore, had no conscious acquaintance with Caesar's style. They did learn, however, from our procedure throughout the term, how to "attack" any type of Latin sentence; and not only had they developed a fair knowledge of the technique of Prose Composition, but they had acquired an excellent vocabulary. With this preparation, they were able to render in almost flawless English the three farily difficult excerpts from Caesar's accounts of both the Gallic and Civil Wars. Their Latin Prose Composition, too, was in most cases almost perfect—in one case, it was perfect; while, in another, only half a point was lost. Let me mention, in this connection, that, in place of Question 7, which, as I have mentioned before, was omitted, I gave them the entire six Prose sentences in Question 4. Thus, for the eight points which they lost on the easy historical question, they had to work much harder on the extra two Prose sentences. It is noteworthy, too, that they completed their test within *two* hours.

The ratings of the six are as follows:

1.	90½
2.	88½
3.	81
4.	75
5.	68
6.	58

Very many conclusions, it is evident, may reasonably be deduced from this experiment. I leave these, however, to be drawn by the reader. I content myself merely with observing that the results of the experiment are pregnant with significance for our teaching technique in Latin. Perhaps I may venture the added observation that herein may be found an indication of a partial solution of the harassing problem that ever confronts the Latin teacher, namely, how to prevent students from resorting to "cribs."

I am not aware of a project of this kind that has been conducted on similar lines hitherto. If, therefore, this article shall be the means of pointing my colleagues to a path whereby they may inspire in the students a keener interest in the language so dear to the hearts of those of us who, in our eager and loving quest, have been rewarded with a knowledge of something of the Mind of Rome, I shall feel amply repaid for the effort involved in drawing it to the attention of all friends of the Classics.

WINIFRED RANKIN.
James Monroe High School.

The Club Council at the Abraham Lincoln High School

One of the subsidiary groups that comprise the Abraham Lincoln High School G. O. Council is the Club Council. This organization was designed primarily to take care of the clerical work necessary in regard to the chartering and supervision of clubs. Since the school's inception two and a half years ago, the Club Council has increased its functions in many respects, and is, in points of numbers and enterprises undertaken, the most active of all clubs in the school.

Besides setting a standard for issuance of charters to clubs, the Council has undertaken as its primary duties those two of increasing club membership so as to have every Lincolnite a club member, and of having mutual coöperation among all clubs. The work has proceeded slowly; but with new ideas being introduced every term, the success of the completion of these aims is rapidly becoming evident.

To be chartered, a club must have held a meeting under the supervision of a Faculty Adviser, who has previously announced his intention to the Club Council of forming a new club, and has been assigned a room by the Administrative Assistant. At the meeting, the roll is taken, and a check-up is made as to whether every club member belongs to the G. O. This is done since the club activity is an extra-curricula activity financed by the G. O. A constitutional committee is assigned the task of preparing a club constitution, based on models of other clubs which are furnished by the Club Council. The Club Council retains these constitutions and examines them carefully.

Scanned with CamScanner

And what, exactly, is the Club Council? It really is the super-club of the school as it consists of the President of every chartered club in the school. The Council meets every other week to discuss club problems such as the two mentioned above; how to increase membership; and how to have mutual coöperation among all the clubs.

To further these plans the following projects have been carried out by the Club Council, or are being undertaken:

1. The publication of a club insert page in the school's publication. This was worked on by members of the literary clubs, who did the actual rewriting; by the Camera Club, which took all photographs, and the art clubs, which prepared cuts for the issue. All clubs submitted a report of their own activities, and the write-ups were grouped under such categories as Science Clubs, Social Science Clubs, and so on.

2. The Club Exhibit of last Fall, which was sponsored and publicized by the Club Council. This exhibit showed the work of more than forty of the school clubs, and was attended by hundreds of parents.

3. The preparation of club programs by the various club groups, to demonstrate the type of work these clubs perform. So successful were these Club Council programs that the G. O. has introduced them into several school assemblies for the edification of the whole student body.

4. The formulation of a definite plan whereby all clubs doing a similar type of work get together to discuss their plans two or three times a term.

5. The working out of a definite club code and a list of suggestions to be given to every club. This code is based on observation of the work done by the various clubs in the school.

6. The observation and written reports of the various clubs by members of the Club Council.

7. The posting of bulletins in the Main Hall Corridor to inform students where club meetings are being held for that particular day.

8. The preparation by the various clubs of articles and materials for sale at next Fall's Club Bazaar. The profits of this enterprise will accrue to the Student Aid Fund.

9. The constant publicizing of interesting club activities through the channels of the school's publication, the *Lincoln Log*.

All of these projects have not, as this is written, been worked out to complete perfection. The combined meetings of clubs doing similar types of work is an innovation of this semester, for example, and the Club Bazaar will not be given until next term. But the fact that the Council has done so much and is doing so much has stirred up interest in its activities to such a degree that others than club officers attend its meetings and frequently teachers are present.

Through the operation of an organization such as this, the most worthwhile of all school extra-curricula activities (and I call clubs such because

every student can equally participate in them) can be greatly enhanced.

BERTRAND BURGER,
Adviser, Club Council.
Abraham Lincoln High School.

Chemistry in Popular Periodicals

Several interesting and valuable studies are available of the type of science articles appearing in either newspapers or magazines. Caldwell and Finley,[1] in an analysis of the biology content of a number of newspapers, found that these articles relate to genuine public needs and interests. They state it as their belief that if the public did not require this information, the paper would not publish these items. Curtis[2] found, in a study of science articles in newspapers, that 41.4 per cent. of the items dealt with the biological sciences and 49 per cent. with the physical sciences.

An examination was made of articles on chemical topics appearing in a number of popular scientific and non-scientific magazines for a period of one year from June 1, 1931, to May 31, 1932, inclusive. It is intended here merely to show the frequency of appearance of articles on various phases of chemistry. Since these magazines are widely circulated, it is believed that continued studies of this kind may serve as valuable guides to topic emphasis in our changing chemical curriculum. Obviously, it is important that our pupils, when they leave school, should be capable of understanding material of a chemical nature appearing in the newspapers or magazines that they are likely to read. Studies of this sort, to be of genuine curriculum value, must be made over long periods of time, since many articles on one topic may appear in a relatively short time because of some recent discovery or occurrence.

The popular scientific magazines examined were:

Nature
Popular Mechanics
Popular Science
Scientific American

The popular non-scientific magazines examined were:

American Mercury
Contemporary Review
Current History
Forum
Good Housekeeping
House and Garden
Ladies' Home Journal
Literary Digest
Nation
North American Review
Reviews of Reviews
St. Nicholas
Saturday Evening Post

SAUL S. HAUBEN.
Brooklyn Technical High School.

A Satisfying Experience in the Teaching of the "Idylls of the King"

There were three introductory periods. Two were given over to prepared discussion, by the students, of such topics as *King Arthur*, *The Holy Grail*, *The Round Table*, *Chivalry*, and *Victorian England*. The third was devoted to an account, by the teacher, of the Legend, following closely Tennyson's treatment of it in the five Idylls to be given detailed study in class. Coupled with this account were the reading of selected passages and the working out of a genealogical chart.

Then followed an assignment requiring the reading of "The Coming of Arthur" and the writing up of special topics, given row by row as follows: (1, 2 and 3) select at least six character-revealing passages, indicating page and line numbers and, briefly, wherein each reveals character; (4) select at least six passages distinguished by the vividness of the pictures they suggest, indicating page and line numbers and, for each, the picture imaginatively seen. Pretend you've been commissioned to portray the picture on canvas; and (5) select at least six passages for their beauty of language or imagery, indicating page and line numbers and, for each, the nature of the beauty discovered.

The reports on this assignment were made on a single day in three classes. In the first, the students were requested to report on the topics assigned. Voluntary discussion was lively and proceeded somewhat as follows. After ascribing certain traits to a character, the speaker would refer his classmates to, and read, the lines revealing them. The results were disappointing. Discussion, though animated, was disjointed. The Idyll was ridden roughshod.

In the second class, this choppiness was avoided by confining discussion to one character or topic at a time. Again the results were disappointing. There was something overworked, futile, about character discussion. In addition, the cumulative beauty and effectiveness of the Idyll were quite thoroughly lost.

I left that second class with firm resolve not to subject the third to a like experience. At lunch I cogitated and masticated. The success of both efforts sent me to the third class with renewed hope and vigor. The ensuing period was so thoroughly enjoyable and the results so satisfying that I decided to record them, on the immodest assumption that such a record might, somewhere, sometime, prove profitable to someone.

I announced to the class that I proposed to read the Idyll and that I would pause frequently in my reading, so that students who had, in doing their homework, selected lines already read, might explain why they had done so. Explanations were, if anything, rather too abundant and were, happily, confined to discussion of the narrative rather than to its restatement. In fact, I deliberately ruled out the possibility of such restatement by telling the story of each subdivision before reading it. For example, in a later period, I told the story of one such subdivision somewhat as follows:

"Now Gareth didn't rush right off to Arthur's Court, even though his mother had said, 'O. K.' But one night, when all was quiet, and Bellicent's sad eyes were closed in sleep, Gareth and two servants, all dressed as farmers, softly stole from the castle and set out for Camelot. And after they had walked for a long time, they could see, far off, the spires and turrets (that is, the towers and steeples) of the City of Camelot. But even as they watched, suddenly the spires and turrets and everything disappeared. This so frightened Gareth's two servants that they turned to him and said:

" 'Oh! Mr. Gareth, Camelot seems to be a swell town, but . . . but it just occurred to us that we forgot to wind the cat and put the clock out before we left.'

"Now, let's see how Tennyson tells the story."

How gratifying was the absorbed interest with which the class then followed the reading! In all, I managed to get through almost half the Idyll, to give thirteen students an opportunity to make fairly extended, oral contributions, and to keep forty students voluntarily interested.

In conclusion, if I were asked to state four essentials for successful teaching of the "Idylls," I would list the following:

(1) Before assigning an Idyll, or part of one, for home reading, relate its story and read selected passages,

Scanned with CamScanner

preferably highly dramatic ones.

(2) Assign, together with the reading, the selection of passages on the basis of their poetic beauty, descriptive power, or character delineation.

(3) In class, read the Idyll, pausing at appropriate points for two reasons: (a) To permit class discussion of the lines read; and (b) to tell the story step by step.

(4) Bear in mind, at all times, that *superior* students have *great* difficulty understanding the archaic language of the "Idylls."

James Monroe High School.

Extra-Curricular Activities at the James Monroe High School

No longer is the mere acquisition of knowledge considered educaton; the emphasis is now upon the development of the individual so that he can take his place in society and contribute to its welfare. He has a civic responsibility to which he must be trained. Secondary education must afford a liberal education to all. This means that we must break away from tradition which is keeping secondary education shackled, for what is the aim of education? In the last analysis, character is the final goal. The question arises, is character the result of nature or nurture? Character training must recognize the individual's own power—self, and also his contemporary life, his contact with his environment. We must therefore teach coöperation, loyalty and honesty through the activities of the school. Character training is successful when the child has a chance to develop from within and when we recognize his latent possibilities and give him an opportunity to cultivate his individuality in such a way that thereby he will be of greater service to others. For this reason we have introduced extra-curricular activities into the high schools.

The extra-curricular activity program at Monroe has been in operation for more than two years and in that time the "point system" adopted has proved very advantageous. Students are encouraged to participate in activities, but the students who are inclined to "run for every office" to "gather all the plums" are prevented from doing so by the rules of the point system, to be explained later. Students who are physically handicapped are directed into activities which are not detrimental to their health and a close check-up is made on the activities in which such students participate. Several teachers of the Health Education Department are on the Extra-Curricular Activity Board. The scholastic record of every student engaged in any kind of activity is carefully checked and complaints from subject teachers are registered with the teacher in charge of activities guidance. In some cases the student is required to give up the activity, and in other cases, where it is found that the activity may be of great benefit to the student, special help is given through individual scholarship aid by other students. In this way many students have taken a greater interest in their school work because they have realized that we want to help them.

Last term nearly 3,000 activity cards were filed, representing more than 1,200 students who participated in extra-curricular activities, showing that each student on the average participated in about two activities. This does not include the annexes. The figures show an increase over the previous terms, and indicate that the students feel something is obtained besides the regular curriculum. Furthermore, the opportunities for development of leadership have been increased.

An interesting factor is the matter of dean's cases (boys only). Of the students engaged in extra-curricular activities, only 72 were discipline cases. These 72 cases included such minor infractions as failure to carry a program card, using a wrong exit, coming late to class, and the like. It does not necessarily follow that extra-curricular activities are the cure of discipline cases; it may be that the troublesome student does not engage in any activity other than annoying his teachers and fellow classmates. On the other hand, the fact that there was a decrease in the number of cases as compared with the previous term, might lead one to suspect a correlation. However, only a more thorough investigation could satisfactorily answer the question.

The "point system" worked out and used at Monroe classifies all activities of the school into six categories under the headings: (1) executive, (2) literary, (3) dramatic, (4) teams (athletic and non-athletic), (5) clerical, (6) squad and club membership.

No student may participate in more than two activities in the same category per term, and all activities are divided into five main groups, A, B, C, D and E, depending on the importance of the activity and the amount of time devoted to it. Students are thus restricted also in the number of activities in which they may participate, not only in the types. This gives many students opportunities to participate in an activity and prevents a student from becoming a "joiner."

Part of the "point system" is herewith reproduced to illustrate how the plan operates.

Every activity in Group A counts 5 units and a student may carry only one activity in this group, which is composed of

President of the General Organization,

President of the Senior Class,

President of the Service League,

Editor-in-Chief of the *Monroe Mirror*,

Vice-president of the Service League,

Captain of Patrol Squad,

Assistant Captain of Patrol Squad,

Managing Editor of the *Monroe Mirror*,

A principal part in a major school production.

Each of these activities is classified as executive, literary or dramatic. A student holding an office in Group A

Scanned with CamScanner

may carry 7 units in other groups in addition to the 5 of the first group.

Every activity in Group B counts 4 units and only 2 of this group may be used in one term. Group C counts 3 units, Group D counts 2 units and Group E 1 unit. A student may enter 3 activities listed in Group C, or 4 in D, or 5 in E, but at no time may there be more than 2 activities of the same kind (executive, literary, etc.), and in no case may a student combine his activities to exceed 9 units except those students of Group A who may carry 12 units. At the end of the term credits are assigned to the various activities ranging from 5 to 50, in multiples of 5. These ratings become a part of the student's permanent school record.

Guidance work in this field is comparatively new, but, when worked out, it ought to prove of inestimable value to the student and to the school.

EUGENIE C. HAUSLE,
In Charge of Extra-Curricular Activities,
James Monroe High School.

EDUCATIONAL NOTES AND ANNOUNCEMENTS

The Coöperative Test Service of the American Council on Education

Until quite recently, high schools have been unable to obtain standardized objective tests for testing pupil achievement in high school subjects which were not unsatisfactory in several respects. High school people should be interested to learn that more satisfactory tests are now available for most of the academic subjects taught in secondary schools.

These tests are produced by the American Council on Education through its Coöperative Test Service, directed by Dr. Ben D. Wood of Columbia University. The production of the tests is financed by a grant from the General Education Board.

Some of the outstanding advantages of the Coöperative Tests are:

1. There will be ten comparable forms in each subject so that it will not be necessary to repeat the same form of a test in any school within a period of ten years in order to carry on a periodical testing program as a basis for guidance work. This point will be readily appreciated by school people who have tried to carry on such a program when only two, or at the most, three forms of any test were available.
2. A new series of tests in all subjects is to be issued about the middle of April each year for ten years. Therefore, they are not available for any possible irregular use by either teachers or pupils before the spring testing period. Also, the tests will be sold only to properly identified school officials and, by special arrangement when desired, will be shipped so as to arrive at the school on any given date.
3. The tests are as uniform in mechanical make-up and in administration procedure as the different subject-matters will permit, so that pupils are not faced with tests of different size, appearance and arrangement in each subject or with widely varying administrative techniques.
4. The results are more nearly comparable than can be obtained usually by using tests from several different sources.

The 1932 and 1933 series of the Coöperative Tests are now available and further information concerning them may be obtained from the Coöperative Test Service, 500 West 116th Street, New York City.

Closely affiliated with the Coöperative Test Service is the Educational Records Bureau at 437 West 59th Street. The Bureau is a non-profit-making, self-supporting organization for educational service. It sponsors an annual spring testing program for both elementary and high schools and furnishes scoring and record service at cost to schools that want such service. It also solicits the coöperation of all schools or school systems carrying on testing programs with a view to establishing adequate norms for the tests used. Write to the above address for more detailed information concerning the Bureau.

The Social Science Teachers' Association Meeting on the Revision of the American History Syllabus

This brief summary of the proceedings of the meeting of April 8 is offered in the hope that it will bring to the entire teaching body, and to social science teachers particularly, a realization of the importance and vitality of an organization still in its infancy. There is no doubt, also, that the topic which was considered is in itself of special significance at this time.

In opening the meeting the chairman emphasized the fact that changed conditions in American life made revision of the American History Syllabus necessary, yes, inevitable. As a matter of fact, a committee of first assistants in social science was already at work on the problem.

What implications have the recent changes in America or the new outlook, created by problems such as the world has never before faced, upon the formulation of such a syllabus? With what philosophy of history or preconceived notions of social purpose, if any, must we approach this task of revision?

The Association was very fortunate, indeed, in having Louis Hacker, the well-known co-author of "History of the United States since 1865" by Hacker and Kendrick and a collaborator in the *Encyclopedia of the Social Sciences*, as the principal speaker of the morning. Lucian Lamm, chairman of the history department of the Franklin K. Lane High School, led

Scanned with CamScanner

the discussion which followed Mr. Hacker's stimulating presentation.

Mr. Hacker immediately plunged into his main thesis. The syllabus required changing because of the changes in what he termed the "American climate" since the war. These changes were so vital, so far-reaching in effect, that it would be better to say that we had witnessed the passing of "an age, not a decade." It was, therefore, absolutely necessary that we stop and question the bases of the previous syllabus, the intellectual philosophy which guided its preparation.

The speaker made it clear that, in his opinion, the chief purpose or philosophy of the old syllabus was to stress the operation of *political* forces —the triumph of *democracy*. It is permeated in all its parts by this political interpretation of history. In furtherance of its basic philosophy, the syllabus depends upon a system of rationalism which attempts to explain the rise of the middle or capitalist class in all countries as both the cause and result of political democracy. This, then, is the central theme. Democracy, therefore, is sanctified as the *summum bonum* of social striving. From this it follows that freedom of speech, suffrage, representative government, *laissez faire* and all the other trappings of political democracy become the very heart of the old syllabus.

Of course, the speaker readily admitted that, in a large measure, these principles were undoubtedly behind many of the social and economic developments of the previous "age." As a matter of fact, when we viewed conditions right after the World War, we might perhaps be justified if we examined them with equanimity. While it was true that here and there certain abuses did arise, we could with considerable justification feel that the principle of democracy had created a highly satisfactory social order. At that time we could hold fast to our old syllabus with smug satisfaction.

Although there was considerable questioning of the political philosophy of the previous decade in former years, never before was it on such a wide scale as it is today. There are many who now realize that the time has come to adopt a different theory of history, a new philosophy of social action, upon which a new syllabus must be built. "In place of political democracy as a guiding, pervasive interest, it should be our purpose to teach and interpret American History entirely on the basis of economic development." As for the old philosophy, we must now admit that it did not shape our economic institutions, but was merely one expression of them.

When we consider, among other things, the changes wrought by technological progress in recent years, the economic interdependence of nations, more apparent now than ever before, how else can we understand the America in which we live except on the basis of economic interpretation? We must retrace our steps and "point out how America evolved from a small agrarian community to a great capitalistic, imperialistic system." We must stress not only the story of the growth and concentration of wealth and industry, but even more the history of the development of our present theories of ownership of wealth, and this as the very keynote to an understanding of our present *mores*. We must make the effort to explain the concepts involved in such questions as why the American Federation of Labor parted with the Knights of Labor, why the I. W. W. arose in American life, what the present position of labor is. How else, Mr. Hacker asks, can we appreciate the importance of finance capitalism? How can we understand our international position today, unless we realize that after 1915 the United States was changed from a debtor to a creditor nation with investment needs abroad?

The speaker, in the course of his presentation, made a vigorous and courageous attack upon a problem, which had been troubling social science teachers for a long time, a problem which goes to the very heart of syllabus making, namely, *indoctrination vs. objectivity*. He asserted that scholars do not now want to wipe out indoctrination. On the contrary, they believe that it is absolutely necessary. Objectivity will not help us in the social sciences. We cannot and should not attempt to struggle through a maze or labyrinth of facts in the hope that they will point to some connecting thread, some underlying Zeitgeist or Weltgeist. In the social sciences we must work on deductive principles. We must start with a preconceived theory of history or philosophy of social action. Further, one cannot escape the fact that consciously or otherwise indoctrination is always present. Objectivity in social science is therefore nothing more than a fiction.

A syllabus cannot be free from indoctrination or propaganda. This is of course true of the old syllabus. It is now merely a question of changing the old form of indoctrination which made political democracy the result of American striving to a new form, more vital, more consonant with changed conditions.

The speaker who opened the discussion which followed Mr. Hacker's presentation expressed the view that the new syllabus must contain fewer details. It must lay stress on habits, skills and attitudes; it must contain more of the world background; it must emphasize social history to a greater degree and certainly more of the history of social thinking in accordance with the ideas of Rugg. Literature, art, and the like should not be taught in separate units. There should rather be an integration of all forces or factors in the development of a unit. The syllabus must also make provision for the specially able pupil who must be trained for leadership. Adequate emphasis must be placed on recent and current events. Mr. Lamm concluded by calling attention to two basic propositions. First, social science must be a preparation for the future as colored and controlled by technological advance. Second, more important than the syllabus in achieving the above objectives is the teacher. A

Scanned with CamScanner

more vital social science in our secondary schools must therefore be conditioned on a re-education of the teacher himself.

Only a very sketchy outline of the interesting discussion which followed from the floor can be here attempted. Among others, the following questions were put to Mr. Hacker:

(1) Will not indoctrination cause social science to lose its character as such and become an adjunct of religion?
(2) Who shall determine what shall be indoctrinated?
(3) If this is the function of the teachers of social science, what should we do if the community refuses to subscribe to our philosophy?
(4) Should the school adopt a new function in the social order? Should it promote revolution?

The danger of starting out without a careful definition of terms became immediately apparent when Mr. Hacker attempted his answer to these questions. The term indoctrination had obviously had a different meaning in the minds of many in the audience, for the speaker began his reply with the statement that his presentation contained the answer to the questions asked. He therefore reiterated that what was necessary in the construction of a new syllabus was the substitution of the economic interpretation, as he had explained it, for the political one.

In conclusion it may interest the general teaching body to know that the Association of Social Science Teachers is making definite plans for civic coöperation by social science teachers. This movement is predicated on the belief that those who teach for leadership in society, for social attitudes and coöperation, must themselves be leaders and active participants in work of worth-while social significance. Tentative plans have already been laid for the functioning of social science teachers in such civic matters as charter revision and election service.

JACOB L. BERNSTEIN.
Franklin K. Lane High School.

Why Go to Chicago?

What will teachers find at Chicago where the Century of Progress Exposition is held this summer?

There will be a well-planned exposition, the theme of which is the demonstration of the dependency of industry and commerce on the pure sciences. This is illustrated by a number of carefully worked out laboratory displays showing exactly how a process or phenomenon would be demonstrated in the school room or laboratory. In another place, these same processes, as they have been adopted by commerce and industry, are shown. For example, the laboratory and commercial production of pig iron from the ferrous and ferric oxides may be demonstrated. These demonstrations have been thoughtfully selected and prepared, in most instances by teachers in colleges and universities. They are not merely spectacular, but truly scientific.

These exhibits have been divided into seven subject fields; Astronomy, Physics, Mathematics, Chemistry, Biology, Geology and Medicine. For teachers, many new things in presentation and approach can be learned from them.

The University of Chicago offers summer courses to teachers. Its School of Education is sponsoring several conferences. One, that of the Administrative Officers in Institutions of Higher Learning, plans to discuss "Permanent Readjustment in Higher Education to Meet Changing Social Conditions." Another, the Institute for Public School Superintendents and Principals, expects to discuss "Public Administration and Supervision." Mr. James M. Stifler, Secretary of the University, indicates that many of the exposition projects are correlated with the work of the University, and have been worked out by members of the University staff.

The Adler Planetarium is one of the few fine ones in the world. To students of astronomy, this beautifully synchronized set of projectoscopes is indeed a delight. When the lights are turned off, the visitor sees, projected on the dome-shaped ceiling, the firmament. More remarkable still is the fact that the positions of the stars, moon and sun, as they were one hundred years ago, or will appear one hundred years hence, can be shown by simply manipulating the projectors. This mechanism was produced by the Zeiss Optical Company, and is the only one in America.

The National Education Association will meet in July at the exposition, and the Intercollegiate Musical Council will hold a meeting there during the same month.

Those interested in Art will find the Summer School of the Art Institute of Chicago an attraction. There has been collected by the Art Institute, in connection with the exposition, "the most important exhibition of European and American paintings and sculpture ever assembled in this country." The proposed work at the Institute includes such courses as Methods of Art Instruction, School Crafts, Modeling and the several types of drawing.

Dr. Henry Crews, former professor of Physics at Northwestern University, who is Chief of the Scientific Exhibits of the Exposition, has this to say concerning the fair:

"The aim of our staff is to interpret to the American people the spirit of the National Research Council Committee, as inspired by Dr. Burgess and Dr. Jewett. In attempting this, we are attempting to demonstrate the theme of the fair and to make plain what is meant by scientific method, which, after all, is the outstanding achievement of the last three centuries. To show phenomena rather than apparatus is not easy, but that is what we are attempting; to show the processes of life rather than museum specimens is still more difficult, but that is what we are attempting. . . ."

The Rosenwald Museum of Commerce and Industry is patterned after the famous Deutsches Museum in Munich. Here, the story of man's progress is graphically told. The vis-

Scanned with CamScanner

itor with serious interest can spend many profitable hours in this museum.

Available for students, too, is the Field Museum and the Shedd Aquarium. Both are long established and rich in materials for study.

Announcements of reasonable prices for hotels and restaurants have been made. Transportation will be cheap. The University and the Art School have announced special courses and lectures. It may be well here to remind the reader that Chicago is on Lake Michigan and that a fine boat service to Cleveland, Detroit, Canada and other lake ports is available. Teachers who care to combine a summer of serious study with a vacation will find the Chicago Exposition worth while.

High School Teachers at the Chicago Meeting of the National Education Association

The May issue of *Secondary Education*, which is published by the Department of Secondary Education of the National Education Association, contains much matter of interest to high school teachers. Especial attention is given to the present emergency in education. Valuable articles appear under the following headings: "Providing for Individual Differences Among High School Pupils," "International Relations in a Rural High School," "It Takes More Than Victories to Make Sport," "Radio in Secondary Education."

In addition to some minor articles, *Secondary Education* includes the tentative program of the Department of Secondary Education, in connection with the Chicago convention of the National Education Association. The program centers around two general meetings and eight round-table conferences, dealing with the National Survey of Secondary Education. Many men and women connected with the work of this National Survey will present their viewpoints as specialists. High school teachers will lead in discussions of the papers presented.

The program has been arranged by President Ernest D. Lewis of the Department of Secondary Education, with the assistance of Emma McCredie of the Lindblom High School, Chicago, Ill.

FIRST SESSION—JULY 3

After a General Meeting, the Department will Divide into Eight Round-table Conferences.

General Meeting, 2 p. m.—Stevens Hotel, Grand Ballroom:

Presiding, Frederick T. Wilhelms, Bowen High School, Chicago, Ill., President, Chicago High School Teachers Association.

Report of the Joint Commission on the Emergency in Education—James B. Edmonson, School of Education, University of Michigan, Ann Arbor, Mich.

"The Changing High School Curriculum"—

Leonard V. Koos, School of Education, University of Chicago, Associate Director of the National Survey of Secondary Education.

Discussion—Joseph B. Orleans, George Washington High School, New York, N. Y., and Chairman of the Committee on the Integration of High School Studies of the Department of Secondary Education.

English Round-table Conference in Coöperation with the National Council of Teachers of English, 3:00 p. m. — Stevens Hotel Room 423 A:

Chairman: Mrs. Mabel Tillson Garrette, Crane Jr. High School, Chicago, Ill.

"English in the Changing Curriculum of the High School"—

Dora V. Smith, College of Education, University of Minnesota, Minneapolis, Minn., and Specialist, National Survey of Secondary Education.

Leaders of Discussion: Stella Center, John Adams High School, New York City, former president, National Council of Teachers of English; Frederick Houk Law, President, High School Teachers Association, New York City.

Science Round-table Conference in Coöperation with the Department of Science Instruction, 3:00 p. m. — Stevens Hotel Grand Ballroom:

Chairman: Willis A. Sutton, Superintendent of Schools, Atlanta, Ga.

Section A

"Nature Study in the Schools"—

Elliot P. Downing, School of Education, University of Chicago, Chicago, Ill.

Leader of Discussion: Theodosia Hadley, Western State Teachers College, Kalamazoo, Mich.

Section B

"Science in the Changing Curriculum of the High School"—

Wilbur L. Beauchamp, Department of Education, University of Chicago, and Specialist, National Survey of Secondary Education.

Leader of Discussion: Allen R. Moore, Director of Natural Sciences, J. Sterling Morton High School, Cicero, Ill.

Mathematics Round-table Conference in Coöperation with the National Council of Teachers of Mathematics, 3:00 p. m. — Stevens Hotel:

Chairman: E. C. Hinkle, Chicago Normal College, Chicago, Ill.

"Mathematics in the Changing Curriculum of the High School"—

Edwin S. Lide, Department of Education, University of Chicago, Chicago, Ill., and Specialist, National Survey of Secondary Education.

Leader of Discussion: William Betz, Department of Mathematics, Rochester, N. Y., and President, National Council of Teachers of Mathematics.

Foreign Language Round-table Conference in Coöperation with the National Federation of Modern

Scanned with CamScanner

Language Teachers, 3:00 p. m.—Stevens Hotel:

Chairman: Arthur A. Bovee, Principal, University High School, University of Chicago, Chicago, Ill.

"Foreign Languages in the Changing Curriculum of the High School"—

Helen M. Eddy, University of Iowa, Iowa City, Iowa, and Specialist, National Survey of Secondary Education.

Leader of Discussion: Lilly Lindquist, Supervisor of Foreign Languages, Detroit, Mich.

Social Science Round-table Conference in Coöperation with the Department of Social Studies, 3:00 p. m.—Stevens Hotel, 250 Lower Tower Ballroom:

"Social Studies in the Changing Curriculum of the High School"—

William G. Kimmel, Executive Secretary for the Investigation of the Social Studies in the Schools, American Historical Association, and Specialist, National Survey of Secondary Education.

Leaders of Discussion: Winfield L. Rice, Acting Director of Civics, High School Division, New York, N. Y.

Music and Art Round-table Conference, 3:00 p. m.—Stevens Hotel:

"Music and Art in the Changing Curriculum of the High School"—

Anne E. Pierce, University High School, University of Iowa, Iowa City, Iowa, and Specialist, National Survey of Secondary Education; Forest Grant, Director of Art, High School Division, New York City.

Leaders of Discussion: Lilla Bella Pitts, Grover Cleveland Junior High School, Elizabeth, N. J.; Estelle Hayden, Director, Art Department, Public Schools, Des Moines, Iowa.

Commercial and Vocational Branches Round-table Conference, 3:00 p. m.—Stevens Hotel:

Chairman: Emma M. McCredie, Lindblom High School, Chicago, Ill.

"Commercial and Vocational Subjects in the Changing Curriculum of the High School"—

Victor H. Noll, Teachers College, Columbia University, New York; Lloyd L. Jones, Ohio State University, Columbus, Ohio, and Franklin J. Keller, Director of National Occupational Conference, New York.

Leaders of Discussion: Anne C. Woodward, Somerville High School, Somerville, Mass.; J. O. Malott, Specialist in Commercial Education, Office of Education, Washington, D. C.; Howard L. Briggs, Director, Department of Vocational and Practical Arts Education, Cleveland, Ohio.

LUNCHEON

July 4, 12:30 p. m., Stevens Hotel

SECOND SESSION—JULY 5

General Meeting, 2:00 p. m.—Stevens Hotel, Grand Ballroom.

Presiding, Ernest D. Lewis, President, Department of Secondary Education.

"Relations Between College and the Public High School"—

P. Roy Brammell, School of Education, Connecticut State College, Storrs, Conn., and Specialist, National Survey of Secondary Education.

Jerome Kerwin, Dean of Education, University of Chicago.

George Works, Dean of Students and University Examiner, University of Chicago, Chicago, Ill.

Leader of Discussion: Mary E. Courtenay, Dean of Girls, Lindblom High School, Chicago, Ill.

The Second Session Will Be Followed by the Annual Business Meeting

How Schools in 1,095 Cities Have "Cut Their Cloth"

How America's city schools have been affected in the present economic crisis is revealed by the Federal Office of Education. Inquiries addressed to more than 3,000 school superintendents in cities having a population of 2,500 or more brought information on school budgets for current expenses, school budgets for capital outlay, teacher-salary budgets, school building activities, length of school term and educational activities eliminated or curtailed.

The report, Office of Education Circular No. 79, prepared by W. S. Deffenbaugh and Emery M. Foster of the Office of Education staff, shows among other facts and statistics the following summary of adjustments made in many instances by city schools to meet decreased resources.

Teacher salary budgets lowered in some cities to as much as 40 per cent of last year's budgets.

Increased number of pupils per teacher in elementary schools, junior high schools and senior high schools. (In more than 50 per cent of cities reporting.)

Decreased number of teachers 2.4 per cent, although enrollment increased 1.3 per cent.

Planned for a shorter term (91 cities).

Decreased text-book purchases 16.8 per cent. (Approximate decrease, $5,487,177.)

Bought 12.6 per cent fewer elementary school books.

Bought 31.2 per cent fewer junior high school books.

Bought 20.7 per cent fewer senior high school books.

Decreased capital outlay in two years 57.6 per cent.

107,000 pupils attending school "part time" because of inadequate school building facilities.

59,000 pupils are housed in portable or temporary buildings because of lack of classroom space in regular school buildings.

Postponed repair of existing buildings. (In about 25 per cent of cities reporting.)

Curtailments in School Activities

Naturally, since the school exists for

Scanned with CamScanner

imparting knowledge to the pupils, the curriculum is generally the last thing to be touched by the Nation's school economy program. However, more than half of the cities reporting to the Federal Office of Education had eliminated or curtailed some school activities or services.—*Release of the U. S. Office of Education.*

REVIEW

The Great Technology: Social Chaos and the Public Mind

By Harold Rugg. New York, John Day Company, 1933.

There was the implication of a challenge to this country's future in Matthew Arnold's remark: "The test of your democracy will come with the exhaustion of your public lands." The time has come; our public lands are practically exhausted. Therefore, we cannot solve present problems by the time-honored American way of sending surplus labor westward, thus ending the surplus and at the same time providing expanding markets for the return of "good times." The present depression, which began as a stock market crash, has become an international crisis with political, social and educational aspects as well as economic. It is not surprising, then, that leading minds are grappling with the problem from various points of view, explaining the present from the past, suggesting routes through which we should pass toward recovery.

But the engineer considers the problem from the point of view of the generation and distribution of power. Similarly, economists see the problem from the viewpoints of the price system; the political scientist from the viewpoint of the organization and administration of government. What is needed is an integration of economics, government, engineering, education and history, an integration which will view the social crisis steadily and as a whole, and which will provide the basis for decisions and plans of social policy for production and distribution of goods. Such an integration is attempted in this book by Harold Rugg, who is no novice in this process, as he has to his credit a series of text-books wherein the various social sciences have been blended into a unity so that the student can see social problems in their larger relations.

In general, Professor Rugg believes that the present crisis is not just one more depression from which we will emerge into prosperity, according to the well-known theories of the business cycle, but really marks the end of an epoch. He presents a series of problems which must be faced now before a new social order may arise. The solution lies along the path of education of adult and youth, to indoctrinate them with the idea that the scientific methods, so successful in production, must be applied to social problems.

In the early pages of the book are documented six reasons for considering this depression more than an incident in a cycle. These reasons are as follows: (1) This depression is more prolonged. Practically all previous depressions have been short-lived. In most cases the first signs of recovery were noted within two years. This crisis, however, is now in its fourth year with very few hopeful signs in view. (2) It is world-wide and more violent. This needs no evidence here, for the newspapers have printed enough to verify a hypothesis held by some impracticable academicians that the world is an interdependent whole with an economic nervous system extending to all parts of the globe. (3) Trade-destroying tariffs have been raised between trade-starved peoples. This symptom of pathological nationalism which has assumed the proportions of an epidemic, is to a large degree due to the leadership of the United States which has taught the world how trade can be paralyzed in the name of patriotism. (4) Large stocks of merchandise were on hand in 1929 and have not as yet been consumed. The stocks on hand at the beginning of previous depressions were used up within a year or a year and a half, and the consequent demand for more goods started industry on its upward path. But almost four years have not been sufficient to deplete the stocks on hand in 1929. (5) An undue burden was placed on the economic system by the World War and the Treaty of Versailles. The former had all the evil effects on the economic system that wars generally have on the economic structure. Versailles, however, introduced the economic concepts of reparations and war debts on a world-wide scale and their reactions on the flow of credits destroyed the finely adjusted balance of international payments. It is more than a mere coincidence that history's biggest war was followed by history's biggest depression. (6) The development of machine technology, referred to in Modern History texts as the Second Industrial Revolution, made possible the over-production mentioned above and introduced technological unemployment by its new and more efficient method of generating and distributions energy in its various forms.

Many options present themselves as a way out of the muddle, but they all can be reduced to three: "rudderless, drifting inaction; emotional assertion of class rights with some degree of design; scientifically designed reconstruction of society." Needless to say, the author prefers the last course of action.

Before giving descriptions of various plans of social reconstruction, the author gives an account of industrial development since the First Industrial

Scanned with CamScanner

Revolution. This account consumes about one-third of the book.

In general, his historical account is acceptable in its development. He recognizes the trend during the past century and a half away from *laissez-faire*, greedily accepted by industrial leaders one hundred years ago, to the modern age with its tendency toward social control. However, I could not help feeling that his ideal was not Thucydides, the impartial, but Tacitus, the Judge Advocate, pleading his case at the bar, for at times his understatement, or overstatement, while very rhetorical, loses its force when checked with more reliable sources. For instance, on page 51 Dr. Rugg gives the population of England in 1800 as 7,000,000 and on page 80, the population in 1811 is given as 12,000,000, an increase of 71%. However, the Statesman's Year Book gives the population as 8,900,000 in 1801 and 10,000,000 in 1811, an increase of only 12%.

His point of view may be given in his own words: "As a result of the century of effort men were given fairly competent machines to aid them in producing a livelihood. Power-driven machines to raise, harvest and prepare their food; machines to make their clothing; machines to build, furnish, heat, cool and clean houses; machines to transport people and their things. Machines — power-driven — to send messages, to carry on business, to make records, to printing reading matter, to entertain. Thus, the foundation was laid for the power production of goods.

"But machine technology could not have been achieved by the invention of engines and machines alone. Two other sets of ideas contributed to it equally . . ." (p. 42). The first of these was the concept of corporate control; the second, *laissez-faire* and with it the "myth" that government rules with the consent of the governed.

This whole system led to economic anarchy. Since the aim of the leaders was not the greatest good of the greatest number, but maximum profit in terms of dollars, there was no social design of the system for social ends. Rather was the future often mortgaged for the sake of immediate gain. And the result of it all was 1929 and after.

After any crash comes the task of reconstruction and the author considers various choices in the last half of the book. He first presents synopses of various plans (those of Beard, Chase, Soule, LaFollette, and Swope) which are elaborated more fully in the Beard's "America Faces the Future." Not one of them, it may be noted, assumes a need of making drastic changes in the nature of the economic system. All of them, on the other hand, provide for far greater social control through statutory creation of a National Economic Council to act as a planning board with power to regulate the basic means of production which, in general, remain under private ownership.

From all this, Dr. Rugg deduces fourteen axioms considered indispensable to a new synthesis of economic reconstruction wherein the technical operation of industry will be reconciled with democratic control. Some of these may be mentioned briefly.

1. An economy of abundance is possible with the present level of technological development.
2. Wages and prices cannot be set in terms of workers' productivity. Some other unit of purchasing must be found.
3. The national economic system must be controlled and operated as a single unit.
4. Reconstruction must recognize that dynamic populations are becoming static.
5. A stabilized social order demands a new set of units of exchange.
6. Only real wealth must be produced and distributed. An unduly large surplus must not be allowed to the well-to-do.
7. The national economic system must be reconstructed to provide for central control of the whole enterprise.

Up to this point, the author is at his best. Not so convincing is he, however, when he offers specific plans. One of his plans, for instance, calls for a National Council of Cultural Reconstruction, which would call for the modest sum of two or three billion dollars *each year* to be obtained from the Reconstruction Finance Corporation. Compared to this our present wonderland of bureaucracy would be very Lilliputian indeed! It is enough to recall that total appropriations for the fiscal year of 1933 were about four billion dollars and that the deficit is still with us.

In discussing educational consequences of the crisis, the learned doctor soon gets back into his stride. Education of adult and youth, that is to say, education of the whole being for life in a technological order and not merely training in literacy, is considered the key to social reconstruction, for education occupies a strategic position in the social order.

Education is in a state of flux; there is much unrest since the World War. This is not unexpected, for great social movements and crises have always been accompanied by a critical re-evaluation of educative aims and processes. The Renaissance was responsible for the reorganization of secondary education; the Reformation, for universal elementary education; the French Revolution for development along national lines; the scientific movement's influence on industry and its concomitant economic nationalism paved the way for vocational education.

The above are examples of piecemeal reconstruction. Dr. Rugg visions an educational reconstruction which will make the process life-long and though he offers a program for youth, he is as much concerned with the education of those beyond school age.

His program, the ultimate aim of which is the creation of human personality, divides itself into two phases: the scientific, to teach the technique of problem solving (the search for facts, hypothesis, verification, etc.),

Scanned with CamScanner

and the aesthetic, to teach appreciation. "No matter how efficient its technology or humane its government, no culture will be truly great if it does not instill a high order of appreciation in the people." The central intellectual core of his curriculum is an introduction to changing civilization and cultures, the title, incidently of one of his texts. It would be "social science . . . plus some of the materials and activities sometimes grouped in English literature and science."

Although this book must be read with others, notably "America Faces the Future," edited by Beard, to get a balanced view of the problem, this work is nevertheless significant, not so much for the problems it settles, as for the problems it leaves unsettled—problems which must be faced in attempting an intelligent criticism of our economic structure. Matthew Arnold's challenge remains unanswered.

TEACHING makes the teacher subordinate to organization. Therefore important school changes come often more easily when a whole system is moving in the same direction. Teachers' meetings, unless the participants are content to remain civically ossified, must discuss what are the political needs of now, and must resolve what changes the teachers will make. Superintendents, meeting with representatives of teachers, must clarify the doctrines of tax-supported schools and lay out plans for making the daily exercise work toward civic betterment.

Superintendents and teachers planning district conventions must recognize the absurdity of the old programs which have given this preponderating theme so little attention among the matters of less importance.

The management of teacher-training institutions must give every student thorough inoculation with the overwhelming political duty of the tax-supported public school and equip the teacher graduates with intelligent ability to work toward the civic aim.

These are the chief discouragements appearing in recent educational literature. In spite of my absurdly optimistic temperament, I find the situation desperately serious.

But in spite ot ali the evidence of undesirable qualities developed in teachers by teaching, these men and women are not so debilitated by unfortunate traits as are ministers, lawyers, business men, politicians or any trade or profession I ever came in contact with. During all these years I have known intimately some pitifully wizened souls holding places intended for teachers. But I could match each one of them with two or three contemptibles in each of the other walks of life. An outstanding fact of every group of teachers I have worked with during forty years is that they could be led to higher ground. What does teaching do to teachers? The undesirable things I have quoted. But teaching also, as I have seen year after year, creates a hunger to be of value to the world, a desire to be in the procession of progress, an affection for the human stuff that keeps walking into school year after year and walking out to make up the nation. Teaching has taught teachers that teaching has to be organized, that loyalty to the organization is the only respectable course. Organize, with the coöperation of representative teachers, the public schools on their original foundation of political preparation, supervise the new teaching fairly, applying to it the same corrective measures you have given to reading and arithmetic. You will at least escape the present nasty charge that you never intelligently or actively tried to carry out the promise that the founders made for you.

WILLIAM McANDREW

In his address "What Teaching Does To Teachers," given at the 15th Mid-year Education Conference, Michigan State Normal College, January, 1933, and published in **The American Schoolmaster** for May 15, 1933.

THE CHOICE OF TEACHERS DURING THE DEPRESSION*

BEYOND the swirling rapids of the East River there stands in a quiet tree-shadowed courtyard the only monument to an educator of which New York City boasts. Behind the statue lies a low wooden building dating from the 18th century. In front of it rises a tower reminiscent of Magdalen College in Oxford. Through the archway beneath the tower one catches glimpses of the life of the town flowing busily and noisily past this sheltered close. The town is a descendant of the Dutch village whose fathers built the little low-set frame school house behind the statue. That is possibly why the bronze Erasmus, a replica of the original in Rotterdam, seems so perfectly at home in his new environment, as he stands, intent upon his book, a look of inscrutable benevolence on his keen face. Here you have a man neither young nor old, yet perennially youthful, eager for life and knowledge, *turning* the pages of the book he is reading as he stands backed by antiquity, facing modernity

The statue of Erasmus may be said to represent an ideal. It recalls a man of definite standards, profound scholarship, keen wit, wide and varied experience of life, himself a teacher in a time of unrest and upheaval. It suggests that there is a certain permanence of ideals of which the school is the guardian, somewhat as the monasteries of the Middle Ages were the guardians of the old ideals of learning, of hospitality, of the honesty of manual labor.

This parallelism between the ancient monasteries and our schools today has dictine Monasteries," says Robinson, "furnished retreats where the scholar might study and write in spite of the prevailing disorder of the time." What of our schools today? I have in mind a boy whose father is slowly dying of a malignant growth. The mother and sister both work. The boy himself works from eight at night to four in the morning, sometimes, in an emergency, to six or eight in the morning, then comes to school, as to a retreat where he may "study in spite of the disorder of the time." I have in mind a young girl whose home has been without heat for most of the winter and who has studied her lessons in the evening by the light of a candle because there was no money to pay for electricity. She finds school not only a retreat for study, but also a refuge that meets her actual physical need of light and warmth. In these days there are literally hundreds of such children, and of other children whose escape from an intolerably unhappy emotional situation at home lies within the shelter of the school.

*Delivered before the Modern Language Conference on the Improvement of Teaching During the Depression, Teachers College, Columbia University, May 13, 1933.

Scanned with CamScanner

How are we to choose the men and women who shall teach these as well as the more fortunate children? Not, primarily, because those men and women want a job or need one. In times of depression we read a great deal about the injustice of keeping on the older teachers and so keeping out the young ones. As if age and justice had any relation to each other in such a case! Or, especially, as if the schools existed merely to furnish jobs! Teaching is of necessity a highly individualized art and not simply a wage-earning occupation. "Not every one that saith unto me, Lord, Lord, shall enter into the kingdom of heaven," and not every college graduate who clamors for a job is fit to be a teacher.

One's attitude toward any question is inevitably influenced by one's previous history. You will recognize this statement as a premonitory symptom of an approaching attack of reminiscence. In the early days of this century, then, the choice of a teacher for a New York City high school was to a very great extent at the discretion of a principal. To illustrate: A young friend of mine, recently graduated from Vassar with Phi Beta Kappa, was at that time finishing her second year of teaching in a small boarding school in the Hudson River valley. She learned through the superintendent of schools in her home town of a possible vacancy for the coming year in Erasmus Hall. By the same gentleman the principal of Erasmus Hall, Dr. Gunnison, was informed that my friend Miss X. would consider favorably exchanging the seclusion of the Hudson River town for the lure of gay Flatbush. There was an interview in the principal's office in the old 18th century building, to which Miss X. went with a very rapid pulse, though greatly fortified by a brightly shining Phi Beta Kappa key and all the credentials she could muster. Unfortunately, Dr. Gunnison ignored the key and brushed aside the credentials rather cavalierly, saying:

"Oh, yes, that's all very well, but what can you do?"

Before my goggled-eyed young friend could manage to stammer that she thought she had spent the last few minutes telling him all that quite prettily, he went on:

"You see, it is my belief that the school should be a social centre, that the four years of high school should be years of happy social intercourse for the pupils, and I want teachers who can contribute a great deal more than mere classroom work. I wish you played the fiddle."

"Why the fiddle, Dr. Gunnison?"

"Because it can be transported without a truck and four or five men to handle it, and because I'd like to have you play in the school orchestra."

My friend looked past Dr. Gunnison and the old mantel-piece with tiles imported specially from Holland. She saw the gracious old sycamore trees shading the lawn that stretched to the pleasant old street. Everything looked attractive to her. Then she remembered, with a flash of inspiration, that in her long-gone childhood she had insisted on having a violin and on practising it to the agony of her family and the wrath of the neighbors. Falteringly she said: "Perhaps I *could* play the fiddle, I used to years ago." Always afterwards she said she got the job because she could play the fiddle. This was literally true, though there were certain formalities necessary to legalize the award.

This is what was done at that time: The principal desiring the appointment of a certain teacher recommended him—or her—for the city examinations. Without such recommendation no one was admitted to the examinations. These were given on two successive days, pedagogy the first, your subject last, three hours to each session. If you had come from out of town, the examiners very kindly arranged upon request to give you the oral examination on the afternoon of the second day. It seems incredible, doesn't it? Life was so simple, in those days. Simple and direct, too, was Dr. Gunnison's expression of opinion regarding the pedagogical part of the examination:

"You say you haven't had a lot of courses in pedagogy? Don't let that worry you. Just get De Garmo's *Principles of Teaching* and cram up on the nomenclature and you'll get by. You know enough of the practical side of it."

After these three examinations you had, of course, a physical examination. Then you spent a long morning teaching, under observation by Dr. Gunnison, his assistant, Miss Turner, some teacher of your subject, and anybody else the principal thought might enjoy the show. Finally, having survived these various ordeals, you met the local school board, of which Mr. Richard Young was at that time president. They were very august and serious-minded gentlemen—apparently—and you felt like a very small and wriggly cabbage-moth impaled on a pin as you sat at the long mahogany table during the interview. After they had read aloud the confidential letters from the good-natured souls who had permitted you to refer to them, and had questioned you and discussed you quite dispassionately in your uncomfortable presence, you were glad to flutter out into the free world again. But you almost always got the job, because you never took the *first* examination unless the principal thought you would do.

Dr. Gunnison had rather definite ideas as to what would do for his school, and went to considerable pains to find the teachers who could give him what his school needed. He did not always wait for them to come to him, but in the early days of developing Erasmus Hall High School he frequently went to other towns to observe the work of able teachers and to interview them. Always he had in mind the valuable social qualities which he believed were essential for his purpose. "Your scholarship and your ability in the classroom I take for granted," he is quoted as saying. "Your tact and sympathy and sense of humor I should like to be assured of." "I wish you weren't so—serious in class," he said to a sober-minded young man. "Why don't you smile more?" There was a

Scanned with CamScanner

story current of a man who came to apply to Dr. Gunnison for a position. After setting forth the items of his excellence of equipment, the candidate said:

"I must not forget to tell you, sir, that I neither smoke nor drink."

"That's quite all right," replied the Doctor cheerfully. "I do enough of both for the whole faculty."

"She is an able woman," he said of one candidate, "but her health is poor. We cannot take on a hospital."

One needed robust health, for indeed it was no sinecure, teaching in Erasmus Hall thirty years ago. The first year my friend Miss X., was there she taught the regulation number of periods, played second violin in the school orchestra, coached a basket ball team, and was adviser to a sorority that met every fortnight. In addition to this she was expected to accept every invitation to class spreads, which were frequently of weekly occurrence. Sinecure or not, you knew when you took your job that your extra-curricular activities were an important part of it, and you came to value your social contacts with your pupils for the insight into their spiritual and intellectual needs that you gained from them. Dr. Gunnison had always so valued them, and had scoured the country to find teachers who met his need.

Because he realized, whether our present dignitaries do or not, that there is very great danger of in-breeding in the school system of a big city. It seems on the face of it so logical that the graduates of the high schools shall go on to the local colleges and universities and training-schools for teachers, and then come back to train other generations to graduate from the high schools and go on to the local colleges and universities and training-schools for teachers and then come back to train—and so on, just like the locusts going in and carrying off another grain of corn! Yet one staggers before the appalling perspective of sameness and monotony. There is unquestionably an invigorating quality in the infusion of new blood, the adoption of a different view-point. But the procedure through elementary school to university and back is pretty generally followed by our young people. They have, in consequence, no actual experience of life outside their own town. Very few of them even go outside of New York City to teach before becoming candidates for appointment to our local schools. Apparently they believe with Romeo:

"There is no world without Verona walls,

But purgatory, torture, hell itself!"

No matter how great their scholastic achievement they lack the broadening experience of contact with viewpoints of other regions. They remain parish-minded with the provincialism of a metropolis.

What, then, are we to do about the choice of teachers in a time of depression? Well, remembering that the teacher is the Keeper of the Gate, that we have behind us a precious past and before us a noble future, let us, hardening our hearts and stopping our ears to the clamor for jobs as teachers from the needy of the city, realize that our responsibility is to the children who come thronging to us for sanctuary in these disordered times and select with care those men and women whose endowments promise to meet their needs.

How select them? The technique of selection seems to me unimportant, convinced as I am of "the sterility that is inherent in a technique and the magic that flows from a philosophy." But I am quite sure that when they *are* chosen, their minds will be open, like the book of my bronze friend Erasmus, and that, like him, they will always be ready to turn over the page.

BEATRICE SHAW MCGILL,
Chairman, Department of French.
Erasmus Hall High School.

PRESENT STATUS OF INTELLIGENCE TESTING

What Is Intelligence?

As a preliminary to this discussion it will be worth while to take a moment to get a clear understanding of what the psychologist understands by intelligence. Like most terms in which psychology couches its proclamations, it has come into the laboratory from the street. In non-technical usage it means ability to meet the situations of life successfully, and especially to acquire new experiences and make new adaptations economically. No question is raised as to whether such ability is of ancestral origin or whether it is constructed by experience. Within some thirty years the word has acquired for the psychologist a distinct technical meaning. Even in this limited field of technical usage, however, there is not complete agreement. So illusive is the thing denoted by the word in its narrow technical sense that it is difficult to find enough agreement among experts to justify a definition. The conversion of language from popular to scientific use always leaves upon terminology the taint of loose thinking. Furthermore, the manifestations by which we observe intelligence in those around us are the manifold forms of behavior by which they display this assumed capacity, and such external activities often throw a screen about inner factors such as motive, objectives, and adaptations of actions to purposes. To illustrate: an individual who hears a witty story may laugh mimetically with those about him, and the next moment turn to a companion and ask, "What was the point of the story?" Judged from behavior this dullard responded to the cue as quickly and generously as the quickest-witted there gathered, and yet his slow mentality failed utterly to click to the subtle cue. Another source of obscurity that this term shares in common with all other abstract general terms is that the name seems to create an entity. An identical difficulty is characteristic of the word *instinct*, which has become such a conjuror of ghostly abstractions that careful psychologists and biologists are on the eve of dropping it from their vocabularies. It is the tissues of imagination that abstract terms have

Scanned with CamScanner

woven in the past that gave rise to the outcaste faculty psychology, that myth-maker of the days happily gone by. At the outset we shall lay aside the implication of some obscure and abstract power lurking in the *hinterland* beyond biological phenomena, and regard the word *intelligence* as a term that summarizes the striking single trait of quick and successful behavior in meeting the amazingly complex and shifting situations of environment. I know of no verbal formulation better than that of Woodworth, modestly advanced as merely tentative:

"Acting according to the situation in hand, with use of what has been learned before, but also with due regard to what is novel in the present situation, and to the whole situation rather than to some striking part of it." ("Psychology," Rev. Ed., p. 24)

This definition stresses the following features of intelligence behavior: (1) facility in adjusting to the present situation; (2) application of accumulated experience to the present problem; (3) recognition of points of deviation of the present situation from those roughly similar to it in past experience; (4) mental adjustment to the whole stimulatory situation rather than to some particular, perhaps minor, but exciting aspect of it. One aspect of human intelligence that this definition implies but does not sufficiently emphasize, in my opinion, is the ability through imaging of means that are not directly conveyed by the stimulatory situation to make mental conjectures of solution before a behavioristic application of the imagined means is tried out. This use of images is a kind of rapidly functioning mental trial-and-error. It greatly enriches the resources of our human problem-solving, economizes our energies of both mind and body by dispensing with the actual physical try-out of the several ideational suggestions by substituting a mental try-out that leads to abandonment of futile suggestions in favor of those that will work better, and thus facilitates the most economical and efficient behavior when the moment of action arrives. This feature of intelligence is well illustrated in the suggestions that guide in perfecting inventions, and is given a beautiful laboratory demonstration in the study preceding a chess move or in the preliminary pondering in anticipation of the direct attack on an intricate mathematical problem. In order to incorporate this last important point I hazard in fear and trembling the following definition:

Intelligence is the native capacity to meet problems of both behavior and thought with native and acquired resources, so that adjustment can be made to their crucial difficulties through mental and physical manipulation of means with the greatest economy of effort.

My definition brings to the fore one other point on which there is now pretty general agreement that Woodworth fails to advertise sufficiently, namely, that intelligence itself is native or inborn, though most of the tools through which it demonstrates itself are acquired. At present there would be, I think, practically no

dissent from the view that for biologically-minded psychologists intelligence is a transmission of inheritance, working no doubt through neurological instrumentalities that function as bodily maturation proceeds.

The Opposed Theories as to the Factors in Intelligence: Spearman's; Thorndike's

Current opinion as to the components of intelligence is alined under the leadership of Spearman and Thorndike. Spearman's theory is known as the "two-factor" theory. One of these factors he symbolizes by *g*, which refers to the so-called "general" intelligence tested nowadays by the more famous intelligence tests; while the other, more obscure factor he designates by *s*, which alludes to a supposititious factor that invigorates each behavior or performance. For example: the *s* manifested by subject A might be an artist's unusual sensitiveness to color-tone, while the *s* of his brother artist B might be feeling for form or else composition. Spearman, armed with the mathematician's training, does not find it inconsistent with his two-factor theory to introduce two other symbols, making a sum of four. In his book, "The Abilities of Man," published in 1927, he introduces into his formula two modifying tendencies that he considers to be constantly operative, just as a varicolored spotlight will change the appearance of a dancer. These are an element worked out by Garnet and symbolized by *c* and another differentiated by Webb that is symbolized by *w*. To summarize Spearman's formula: *g*=a general factor analogous to the *energy* of physics; *s*=any single specific factor (multiple *s*'s may cluster in an individual intelligence); *w*=volitional stability (Webb speaks of it tentatively as "persistence of motives" and "consistency of action resulting from volition or will"); *c*=freedom from inertia or quickness of response. It would seem to the lay mind that Spearman's theory has changed subtly into a four-factor theory to be formulated thus: *intelligence* = *gs* modifiable by the variant *wc*. Spearman summarizes the effects of maturation or aging on intelligence thus:

"*g* increases from birth—at first rapidly, then more and more slowly—until not later than 15-16 years (and perhaps much earlier) its growth definitely ceases. Thereafter it normally retains its maximum level unaltered right up to the end of life (or, at least, to the onset of senility). The lines of different individuals run parallel to each other; that is to say, whoever is ahead of another at some early age (11 years, or perhaps still younger) will normally retain this advantage for the rest of his days. For the *s*'s the life history cannot be traced on such simple lines, since these *s*'s themselves are far from simple. At the core of each is what may be called a pure, innate specific aptitude."

Thorndike's theory is called the *Multi-factor Theory*, and he explains it thus:

"The hypothesis which we present and shall defend . . . asserts that . . .

Scanned with CamScanner

the higher forms of intellectual operation are identical with mere association or connection forming, depending upon the same sort of physiological connections but requiring *many more of them*. By the same argument the person whose intellect is greater or higher or better than that of another person differs from him in the last analysis by having, not a new set of physiological processes, but simply a larger number of connections of the ordinary sort."

Thorndike symbolizes a connection by *c*; it would seem to follow that all one has to do to measure an intelligence is to take a census of its *c*'s.

Résumé of Intelligence Test History

The universally known pioneer work in intelligence testing was the elaboration by Alfred Binet and his assistant Simon of an age-level test for backward Paris school children. This testing began at the turn of the century. The tests were standardized and revised in 1908. They had by this time aroused the interest of American experts in the mental-defective field. Dr. H. H. Goddard, then connected with the Vineland, New Jersey institution for the feeble-minded, was the leader who exploited them in this country. He revised them somewhat to adapt them to our American ways. Other revisions have since been made, the most widely used being that of Terman, known as the Stanford Revision of the Binet-Simon scale. It is a remarkable tribute to the genius of Binet that no more accurate measures have been devised for ages 2 to 12, and that this is still the only test that gives a direct I Q, the intelligence index given by all other tests having to be equated to the Binet-Simon. One difficulty of administration with these tests is that they are individual and thus require much time and patience to get results. It was felt that if a satisfactory method of group testing were devised, this handicap would be largely overcome and a much wider use of the testing device could be made. It was our entry into the World War in 1917 that spurred on American psychologists to work out group testing. The need of sorting out recruits on levels of adaptability that would permit them to profit by the kind of intensive training-camp regimen that was appropriate to their degree and kind of intelligence was the incentive to group testing technique. Since many of the recruits had poor schooling two tests were devised: the "Army Alpha", a group test for literates, and the "Army Beta" a group for illiterates. The latter variety of test, which has since been developed in other forms, is known as a performance test. One of the most commonly used is the Pintner-Patterson Performance Scale.

Two difficulties have confronted test-makers: one is to devise a means of testing infants, who should be the most useful subjects for securing data on strictly native behavior, owing to the fact that experience has as yet affected them relatively little. The difficulty in testing infants is obviously to get test material that will encounter measurable and steady reactions. The other difficulty is to devise tests for adults in intelligence maturation. In this case the difficulty is to find testing elements that minimize the experience factor. It must be apparent that if the generally held opinion is correct that so-called native intelligence reaches its complete maturation toward middle adolescence, it is hazardous to introduce the only available test materials that must by that age have become deeply overlaid with experience, and to make the somewhat gratuitous assumption that we can lift off the load of learning and find beneath a deposit of inherited intelligence. Despite these difficulties some progress has been made in both directions. The American phychologist Kuhlmann has revised the Binet tests downward so as to provide fairly successful test materials for infants at the 3-months, 6-months, 12-months, 18-months, and 24-months reaction levels. The Pintner-Cunningham Primary Mental Test is very well adapted to children just entering either the kindergarten or the first grade. There are several other less known tests covering the same field. Many ambitious endeavors have been made at the upper end. The Stanford Revision of the Binet-Simon Test constructed under Terman's supervision provides two super-age tests beyond the 14-year range, one for "average" adults and one for "superior" adults. One of the most widely used group tests for secondary school students and collegians is the Otis Group Intelligence Scale—Advanced Examination; also his Self-administering Tests of Mental Ability—Higher Examination. Other well-known tests for this age-range are Thurstone's Test IV—Psychological Examination for College Freshmen and High School Seniors, and Thorndike's more recent (1927) test called "Intellect CAVD." In this test Thorndike relies largely on the products of academic and other social learning. The elements of this test are indicated by the four letters of the code-title, which mean respectively *completion, arithmetic, vocabulary,* and *directions*. Mention of this test reminds me to emphasize again one point that has already been alluded to, namely, *all intelligence tests are under the necessity of using the products of normal and universally prevalent learning to get at the underlying intelligence indirectly on the assumption that experiences not acquired when the environment favors their acquisition indicate a deficiency in inborn capacity to acquire them*. This assumption underlying intelligence testing makes of school learning-environment a slowly operative intelligence testing device; hence the age-old academic assumption that those who fail to learn under school motivation are mentally dull may be said to be well-founded. However, as will be mentioned more at length in the critical summary, there are pertinent factors in the school atmosphere besides mentality that may encourage or impede attainment.

Practical Uses of Intelligence Testing

Intelligence scores have some practical use in sociological studies and

Scanned with CamScanner

vocational selection. A recent investigator, Burt, made a study of juvenile delinquency and intelligence by investigating 200 juvenile delinquents in comparison with a control group of 400 non-delinquents of the same age and social status. He found 7.6 per cent of the delinquents mentally defective and only 1.2 per cent of the non-delinquents so affected. However, the delinquent groups showed a normal intelligence distribution from I Q under 70 to high I Q's in the 120-140 range. Healy's extensive and careful studies of Chicago delinquents show a similar wide distribution, indicating a negligible correlation between delinquency and defectiveness. As an example of these sociological studies to which allusion has been made I cite two tabulations, the first a picture-drawing performance test given to children ranging from four to ten in California, and the second an intelligence test study of very young children of different occupational groups.

Drawing Test

Parental Stock	*Average I Q*
Jewish	106
Scandinavian	105
Chinese	103
American	100
Japanese	100
German	99
Armenian	92
Iatlian	88
Mexican	87
Indian	86
Negro	83

Occupational Groups

Father's Calling	*Average I Q*
Professional	116
Manager—Proprietor	112
Clerk—Salesman—	
Retailer—Mechanic	108
Farmer—Baker—Printer—	
Chauffeur—Barber—	
Waiter	105
Semi-skilled factory	
operatives—Teamsters—	
Porter—Servant	104
Unskilled laborer	96

But the most wide-spread use has naturally been in schools. A study of such uses has been made from questionnaire reports received from 21 cities of over 10,000 population. The findings are arranged below in order of frequency.

1. Homogeneous classification.
2. Supplementing teacher's estimate of pupil's ability.
3. Diagnosis of the cause of failure.
4. Selection of subnormal groups.
5. Extra promotions.
6. Comparative study of school systems.
7. Admission to the first grade.
8. Placement of entrants from other schools.
9. Regular promotion.
10. Scaling relative teaching efficiency.
11. Selection of supernormal groups.
12. Diagnosis of success.
13. Demotion.
14. Changing teaching methods.
15. Determining class marks.

16. Selection of supervised study groups.
17. Vocational guidance.
18. Determining the number of courses in the curriculum.
19. Determining the selection of the high school curriculum.
20. Admission to high school activities.

An interesting study of the relation of the I Q to school marks is given in a table based on the analysis of over a thousand cases in the Providence public schools.

School Mark Status

I Q Score Range	*Per cent Failed*	*Per cent Condition*	*Per cent Passed*	*Per cent Good*	*Per cent Excellent*
Below 70	40	54	6	0	0
70-79	24	60	16	.0007	0
80-89	4	31	55	9	.009
90-99	.0005	11	67	20	1.5
100-109	.006	6	39	45	9
110-119	0	3	19	57	19
Above 120	0	0	14	33	48

Another short tabulation shows the relation between intelligence and alertness to danger.

Intelligence group	*Per cent injured*
A	33
E	32
C+	51
C	64
C—	71
D	100

Reliability of I Q for Diagnosis and Prognosis

Intelligence testing has been widely used in schools to diagnose learning difficulties and to prognosticate scholastic probabilities. Judgment differs as to its worth. Arguments have ranged all the way from the *laissez faire* attitude of lethargy of the old-fogy type of pedagogue to the battle royal between Bagley and Terman. Bagley maintains that handling pupils on the basis of intelligence expectations is a procedure of educational determinism that steals from youth under the name of science its inalienable right to an equal chance. If all men are created free and equal, why take from them at the threshold of life a fair start by labelling some stupid? Terman replies by calling his opponents would-be miracle-mongers who would conceal under a coating of soft and sentimental words the stubborn fact that nature makes differences that no sophistry of educational optimism can erase. It is a kindlier educational policy to face these inborn variations in ability and provide experiences adapted to their most fruitful exploitation than to gloss them over by sentimentalities that are totally out of keeping with natural law. Let us leave the verbal dispute and look at the statistical evidence. The following table indicates some of the correlations that have been found.

Scanned with CamScanner

Correlations between Entering I Q Scores and High School Ratings

	(r)
I Q and Average Achievement	.495
" " English	.70
" " Social Sciences	.42+
" " Mathematics	.49—
" " Science	.46
" " Foreign Languages	.63
" " Commercial subjects	.43+
" " Manual Arts	.19—

It will be noted that the highest correlations are in the linguistic field and the lowest in manual arts, suggesting that I Q's are better measures of intellectual than of manipulatory and feeling abilities.

As to prognosis, Terman's studies of high I Q's by the follow-up plan would indicate that I Q's give a reliable basis of prediction when they are at the high end of the scale and unusual factors of circumstantial interference are left out of account. In general he and his co-workers have found that high I Q'd individuals have made good in other than purely academic situations. They more than hold their own in the business and professional worlds, on the athletic field, at the social gathering, and in most of the enterprises of after life.

It will be of interest, however, to quote a few opinions of some practical teachers who are not enthusiastic over the deliverances of intelligence testing in order to give a balanced picture of opinion. The views quoted are a few selections from statements made by some 300 teachers and principals who represent fifteen departments of instruction from kindergarten to senior high school. The data were obtained by pupil-teachers who were perhaps able to get a somewhat franker response than awe-inspiring administrative officials could elicit.

Commercial teacher: "No use; they don't correlate with anything."

Classroom teacher: "Tests take too much time; we should study the child."

Modern language teacher: "Don't need these tests; I test by conversations."

Woodshop Teacher: "Not much use; telling is not doing."

Attendance teacher: "I Q tests are dangerous; rarely detect skippers."

High school principal: "Do not show will or determination of pupils."

College faculty member: "I can tell what mark to give when I see the work."

High school English teacher: "By looking at a girl's face I can tell what her mark should be."

Tenth grade teacher: "They do not detect potential criminals."

CRITICAL APPRAISAL

In conclusion, it will perhaps be appropriate to give a summary of personal opinion about these tests so far as they bear on school work.

(1) It is probable that in their present form they have reached the zenith of popularity; this does not imply that they will not still be widely used, but merely that they will not continue as a dominant note in the pedagogical fashion show.

(2) As instruments of measurement they are deficient in exactitude because as Thorndike has pointed out they lack both a zero point and exact equated graduations—a deficiency that scientific measuring devices cannot tolerate.

(3) The great majority of intelligence tests are either entirely literate or preponderantly so; this weights them too heavily with abstract and symbolical material.

(4) Even the more behavioristic performance tests either resort to pictures or to artificial pastime materials such as puzzles, and therefore do not present the practical life situations which, generally speaking, motivate the most adroit reactions.

(5) The artificiality of the testing situation is likely to be suspected by even the very stupid and the very young; hence reactions are more likely than not to lack the normal response "set" which is so valuable in appraising human behavior of all kinds.

(6) These tests indicate "intelligence" almost exclusively in its intellectual aspect. The writer is personally inclined to doubt whether there is such a thing as a purely intellectual mental activity. We certainly see in all forms of problem solving from the cross-word puzzle to the inventive creations of higher mathematics, science, and philosophy a marked accompaniment of emotionally conditioned motivation. Dogged determination to solve the riddle despite bafflement is the great potential back of all human achievement. With the exception of such clumsy pioneer efforts as the Downey Will-Temperament Test the emotional-volitional factor is not measured. It may be hoped that intelligence tests will be invented which will include this neglected factor; but they lie in the future.

(7) Since intelligence tests are strictly time-limited, they do not provide sufficient experimental outlet for either mental or manipulatory trial-and error. It is now generally conceded that all problem-solution, both the trivial and the crucial, resorts to trial-and-error; indeed, that short-cut solutions by so-called insight are simply expeditious trial-and-error in the experimental chamber of a richly stored imagination. Intelligence tests should be devised and administered so that this universal thought-and-action-pattern may be given ample play.

THE OTHER SIDE OF THE PICTURE

The above criticisms are not meant as grounds for repudiating intelligence testing. It has rendered signal service, and with probable improvement in test-construction, standardization, and administrative technique, much more may be hoped. At present the following seems to be the most useful service that intelligence tests can render to schools:

(1) Homogeneous grouping for the purpose of similar methodology, progress-rate, and curricular adaptation. For this purpose intelligence tests should be supplemented by aptitude and attitude tests. Grouping must avoid inferiority fixations.

(2) As a basis for vocational guidance. Misfits are a heavy social liability. They could be largely avoided by sympathetic testing.

WILLIAM J. TAYLOR.

AVAILABLE VISUAL AIDS IN THE TEACHING OF FRENCH CULTURAL MATERIAL

THE visual aids in the teaching of French cultural material in the senior high schools of New York City, offered gratuitously by museums and organizations of the city, will be treated under the following topics: (1) Special Exhibits (including photographs); (2) Lantern (colored stereopticon) slides; (3) Motion picture film, both 35 mm. and 16 mm.; (4) Lectures by members of the Museum staffs; (5) Special guide service, school service and opportunity.

The museums and organizations whose aid is discussed in this article are the following: The Metropolitan Museum of Art, Fifth Avenue and 81st Street; The American Museum of Natural History, Central Park West and 77th Street; the Official French Government Tourist Office (Office Français du Tourisme), 4 East 52nd Street; and the Compagnie Générale Transatlantique (French Line), 19 State Street; all located in New York City.

THE OFFICIAL FRENCH GOVERNMENT TOURIST OFFICE

The Office Français du Tourisme, operating under the Ministère des Travaux Publics, République Française, is not a "travel agency," but a bureau of official tourist information about France. It was established in 1920. The OFFICE has a large and constantly renewed supply of the latest tourist literature about France, copies of which are given free to inquirers. For the convenience of would-be tourists, it has also a few good guide-books (chiefly in English) and maps for sale at cost, and also special road maps for motorists. It also has a collection of thirty-seven motion picture films, loaned free to any New York school, and a collection of fifty-three sets of stereopticon slides, each set having about sixty slides, also for free loan to our schools.

SPECIAL EXHIBITS, INCLUDING PHOTOGRAPHS

The Metropolitan Museum of Art has more than twenty galleries filled with objects of interest to students of French. It is therefore not possible to list their contents. The collections range from jewelry and weapons of the time of Charlemagne to the work of present-day painters, sculptors and craftsmen. As to the many photographs and colorprints that are lent by the Museum to the schools, their number is being increased almost weekly, and it is therefore impossible to supply lists or catalogues of such material.

The American Museum of Natural History has among its special exhibits anthropological material from French Congo, Africa. Also of particular interest are the reproductions in the Hall of Man, of the prehistoric paintings found by M. Norbert Casteret in the subterranean caves at Les Eyzies, Dordogne, France. The finding of these paintings and sculptures of 50,000 years ago is described in detail by M. Casteret in an article in the *National Geographic Magazine*.

The American Museum of Natural History has some of the *National Geographic* photographs mounted and available for distribution to the schools. They are at present cataloguing the prints which are ready for distribution, and have not yet sent out to the schools any notice that these aids are available for them. The mounted prints are sent out in celophane bags to protect them and are classified in the same manner as their series of lantern slides.

The Office Français du Tourisme has innumerable beautifully illustrated booklets of the various regions and important cities of France.

The French Line will supply picture-plans of their most important ships, including the "Normandie," the largest ship in the world. They also have a very large collection of illustrated booklets.

SLIDES (COLORED STEREOPTICON)

The lending collection of the Metropolitan Museum of Art comprises more than 52,000 lantern slides and 12,000 photographs, consisting of reproductions of architecture, sculpture, paintings and decorative arts, furniture, textiles, casts, maps, charts and electro-type reproductions of ancient coins.

There is no printed catalogue, since the collections are being added to constantly.. Application forms for loans are furnished on request and a selection of material will be made for those who cannot come in person, complying as far as possible with their demands. There is one prepared set of slides of interest to students of French: "Jeanne D'Arc," from Domrémy to Rheims.

The American Museum of Natural History has an enormous collection of colored slides. Some of these are *not* accompanied by manuscript. The slide groups *not* accompanied by manuscript are the following:

G 94 Life in a (French) Congo Village
G221 The (Panama) Canal Zone, The French at
G 30 A trip through Belgium
G 28 Normandy and Brittany
G234 Cities of Northern and Central Europe
G235 Europe's High Mountains
G238 The Mediterranean Region
G239 Industries and Products of the Mediterranean Region
G 97 Africa
G 34 Famous Canals of the World (including the Suez, built by the French)
G279 Famous Explorers
G 48 Early Discoverers and Explorers
G304 The Middle Ages
G 63 Paul Revere's Ride
G288 Yorktown
G 53 Inventions of the Early 19th Century

1. Western Europe
*17. France,—Paris
*18. The French Riviera (La Côte d'Azur)
*38. Climbing Mont Blanc
2. Panama Canal (Work of the French at)

The lantern sets of the Office Français du Tourisme have each about sixty slides. They are not accompanied by manuscript. They are as follows:

Set No. 1. Nord de la France
2. Meuse, Champagne, Ardennes
3. Touraine, Orléanais
4. Ile de France
7. Armorique
11. Bourbonnais, Berry, Sologne
12. Bourgogne, Morvan
13. Alsace
14. Jura
15. Dauphiné
19. Vallé du Rhone
21. Vivarais, Velay
23. Région des Causes
18. La Côte d'Azur

46. Tourisme Nautique, Côtes et ports de France
49. L'Hotellerie française autrefois et aujourd'hui
51. Paris
52. Maroc
53. Exposition Coloniale Internationale, Paris, 1931

* Prepared by the writer for French classes in senior high school.

Motion Picture Films

The film comes in two widths, 35 mm. and 16 mm. The former may be shown only in an enclosed fireproof booth and by a licensed operator. The 16 mm. may be shown in any classroom.

The Metropolitan Museum of Art has a dozen films:

A Visit to the Armor Galleries (2 reels). These pictures give in historical sequence authoritative and vivid knowledge not easily obtained in any other way. Knights in authentic armor perform many feats on foot and horseback. Furthermore, the great beauty of design of armor and the armorer's skill in modeling in steel are clearly brought to the attention of the spectator.

The Hidden Talisman (1 reel). Here one sees the ghost of a 15th century French lady searching for a talisman.

Chronicles of America Photoplays. The films of interest to students of French are: Jamestown; The Pilgrims; The Puritans; The Gateway of the West; Wolfe and Montcalm; Declaration of Independence; Yorktown; Eve of the Revolution; Frontier Woman. These are all of three reels each.

The American Museum of Natural History has the following in the 35 mm. width:

Across the St. Gothard Alps (2 reels)
Basques, The French Pyrenees (1 reel)
Berber Tribes of North America (3 reels)
France, Ports of (1 reel)
Lace Makers of Central France (2 reels)
Land of Evangeline (1 reel)
Landmarks of Early Explorations and Settlement of North America (2 reels)
Magic Minas (Basin, Canada) (1 reel)
Normandy and Brittany (2 reels)
Oil Lands of Europe and Africa (Germany, France, Spain, Algeria, Morocco) (2 reels)
Paris (4 reels)
Perfume and Wine Industries in France (1 reel)
Wolfe and Montcalm (Chronicles of America) (3 reels)
Silk, from Cocoon to Spool (1 reel)
Syria (1 reel)
Yorktown (Chronicles of America) (1 reel)

The following films are in 16 mm. width:

Wanderers of the Arabian Desert (1 reel)
Cod Fisherie (½ reel)
Normandy and Brittany (2 reels)
Land of Evangeline (1 reel)
Versailles (1 reel)
Children of Africa (1 reel)
Forest People of Central Africa (1 reel)
Bedouins of the Sahara (1 reel)
Silk, from Cocoon to Spool (1 reel)
Wolfe and Montcalm (3 reels)
Yorktown, (1 reel)

The Office Français du Tourisme has thirty-seven films, 35 mm. only, all of one reel, except Normandy-Brittany, which is two reels:

1. Le Havre
2. The Valley of the Seine, near Paris
3. The Valley of the Seine from Rouen to the Sea
5. A Stroll Through the Lower Alps
7. In the "Cognac" Country
8. Devastated France, Reims
9. Devastated France, Arras
10. Reconstruction Immobilière dans les Régions Dévastées
11. In the Resin Country
12. Cauterets, Pyrenees
13. In the Basque Country
15. Chantilly
16. Tunisia
17. Strassbourg
18. Notre Dame de Paris
19. La Route des Alpes
20. Vichy, The Thermal Establishment
21. Normandy, Brittany (2 reels)

Scanned with CamScanner

22. Le Beau Pays de France, Le Midi
23. The Ascent of the Mer de Glace, Mont Blanc
24. Paris, Walks Along the Banks of the Seine
26. Maroc, Formation des Cadres Indigènes
25. Maroc, Ecoles et Travaux Manuels
27. Maroc, Marrakech la Rouge
30. French Pottery Making
31. Champaigne Wine Preparation
32. The (French) Perfume Industry
33. The Manufacture of Gobelins Tapestry
34. Manufacture of Porcelain at the Sevres National Factory
36. Un Marriage Breton
37. Exposition Coloniale Internationale, Paris, 1931

The French Line, Publicity Department, offers one film 35 mm. in width, in three reels, "The Longest Gangplank in the World."

Lectures by Staff Members

A group of instructors at the Metropolitan Museum of Art, listed on the special leaflet concerning guidance, give special lectures in the lecture halls and gallery talk, many of which concern collections of objects originating in France. At the American Museum of Natural History this special guidance service is also offered. Besides this, there is a semi-weekly afternoon series of illustrated lectures (including talking motion pictures) in the great auditoriums. Among these lectures are:

Our Friends Across the Sea. (Making the acquaintance of Europeans by means of the motion picture camera.)

Normandy and Brittany. (The quaint costumes and customs of the Normandy and Brittany fisherfolk, illustrated by material obtained in France. Talk is given in Brittany dress.)

Wolfe and Montcalm. (This film depicts in detail the statesmanship of Pitt, the strategy of General Wolfe, the obstacles faced by the gallant Frenchman, Montcalm, through the jealousy of Vaudreuil, Governor General, and the spectacular battle waged on the Plains of Abraham, Quebec.

Special Guide Service, School Service and Opportunity

At both museums, classroom and lantern (including motion picture machine) operators are offered free to teachers of the public schools of the City of New York, upon application to the museum. In addition, the American Museum of Natural History has a "School Service Building" which is used for carrying on the Museum's varied activities with the schools. The second floor is given over to classrooms where special instruction is given by museum staff members. Here is also a duplex assembly hall where special lectures and showing of motion pictures may be arranged upon request. Lockers are provided in the basement where classes may hang their wraps when remaining for several hours. On the third floor, in the Lantern Slide

division, is a Teachers' Consultation room provided with illuminated tables to aid in the examination and arrangement of slides for special talks. In the projection room teachers may try out the lantern slides on the screen and review motion pictures.

The Compagnie Générale Transatlantique offers to give performances of the "Guignol" attached to the "Ile de France" wherever that ship is in the harbor. "Guignol" has a répertoire sufficiently varied to suit French students of all grades.

George Washington High School.

THE TENDER TEARES OF THE CROCODILE

There are few teachers who can afford to take themselves and their work so seriously as to ignore the possibilities of an intriguing or humorous quotation in lightening the day's work. What bold spirit among us would have the temerity to deny that a hearty laugh is a most effective lubricant for the machinery of the classroom? After all:

> A little nonsense now and then
> Is relished by the best of men!

In fairness to the reader, however, it must be confessed that the somewhat rambling anthology which follows was selected for a more edifying purpose than that of lessening "the dreary round of teaching." It most effectively illustrates the point that science has made vast inroads upon our traditional lore; that many a high school student of today has more knowledge at his fingertips than renowned sages of a bygone day.

To return to less serious matters: In this sophisticated age we usually apply the term "crocodile tears" to the lachrymal outpourings of insincere individuals. In the past, however, this phrase was exclusively applied to the copious tears of the crocodile. Now what possible occasion, short of unrequited love, could so provoke these unhappy saurians? To find the answer, we must resort to the pages of Spencer's "Faerie Queene." There, couched in beguiling rhymes, we learn:

> As when a wearie traveller, that strayes
> By muddy shore of broad seven-mouthed Nile,
> Unweeting of the perilous wandering wayes,
> Doth meet a cruell craftie crocodile,
> Which, in false griefe hyding his harmfull guile,
> Doth weep full sore, and sheddeth tender teares;
> The foolish man, that pities all this while
> His mournfull plight, is swallowed up unawares.

In our mental peregrinations, some of us may have wondered how the salmon succeeds in vaulting over high waterfalls in his laborious pilgrimage from the sea. M. Drayton, a writer of the eighteenth century, offers an ingenious, albeit an imaginative account. Says he:

> When the salmon seeks a fresher stream to find,
> Which from the sea comes yearly with his kind,
> Here when the labouring fish doth at the foot arrive,
> And finds that by his strength but vainly he doth strive,

Scanned with CamScanner

His tail takes in his mouth and bending
like a bow,
That's to the compass drawn, aloft him-
self doth throw.
Polyolbion; Song iii.

Those of us who read Longfellow's "Hiawatha"—and who among us has not?—will not soon forget the obliging hedgehog who:

Shot his shining quills like arrows,
Saying, with a drowsy murmur,
Through the tangle of his whiskers,
Take my quills, O Hiawatha!

But a truly miraculous porcupine described by the French writer, Guillaume du Bartas, more than matches the above feat:

But O! what monster this that bids me
Battell,
On whose rough back a host of pikes doth
rattle,
Who stringless shoots so many arrows out,
Whose thorny sides are hedged round
about
With stiff steel-pointed quills, and all his
parts
Bristle with bodkins, arm'd with auls and
darts,
Which, by fierce darting, seem still fresh
to spring,
And to his aid still new supplies to bring.
O fortunate shaft-never-wanting bow-man!
Who, as thou fleest, canst hit thy follow-
ing foe-man,
And never missest, or but very narrow,
Th' intended mark of thy selfs-kindred
arrow.
Divine Weekes and Works, Fol. 1633.

And now, even worse: The sins of the house fly, arch enemy of every board of health, dread adversary of Howard, are condoned, nay, forgiven by Shakespeare who writes:

Titus—What dost thou strike at Marcus,
with thy knife?
Marcus—At that which I have killed, my
lord,—a fly.
Titus—Out on thee, murderer; thou killest
mine heart;
Mine eyes are cloy'd with view of
tyranny.
A deed of death done on the inno-
cent,
Becomes not Titus' brother. Get
thee gone;
I see thou art not for my company.
Marcus—Alas, my lord, I have but kill'd
a fly.
Titus—But how if that fly had a father
and a mother, . . .
Poor harmless fly.
Titus Andronicus, Act II, Scene 2.

It must be admitted that the great Elizabethan was somewhat off the mark in locating the fangs of the snake, choosing the forked tongue as the poisonous weapon:

And when thee from thy bosom pluck a
flower,
Guard it, I pray thee, with a lurking
adder
Whose double tongue may with a mortal
touch
Throw death upon thy sovereign's enemies.
Richard II, Act III, Scene 1.

Webster, his fellow dramatist and contemporary, prefers to locate the fangs in the tail of the adder:

Repentance then will follow like the sting
Placed in the adder's tail.
Victoria Corombona, Act II.

Ben Jonson subscribes to the superstition that young snakes are protected from danger by being swallowed by their mothers. It is scarcely necessary to point out that this belief still secures wide currency. Says Jonson:

Or, till we speak, must all run in, to our
Like the young adders to the old one's
tongue.
The Devil Is an Ass, Prologue.

In connection with the subject of insect metamorphosis, Francis Bacon's ideas were somewhat vague, if not actually erroneous. Ignoring the pupa stage which all good caterpillars must undergo, he writes:

The caterpillar, towards the
end of summer, waxeth vola-
and turneth into a butterfly
perhaps some other fly.

Leigh, an eighteenth century writer, pours contumely upon the young

the ichneumon fly, accusing them of unfilial affection in devouring their maternal parent. However, whatever sins the young flies may possess, this one should be wiped off their 'scutcheon in the interests of truth and justice. He writes:

The caterpillar deposits her eggs in the clefts of trees which are enliven'd by the influence of the sun at a proper season of the year. I do not think that she is devoured by her young ones which creep within her to suck, for I have sometimes found them creeping on cabbages with twenty young ones within them, and sometimes dead with these within their bodies.

What poet of the eighteenth century could possibly forego an opportunity to point an edifying moral? The poem which follows gives all the harrowing details of a poor worm's mortification. Needless to say, virtue triumphs in the end.

As an ant of his talents superiously vain,
Was trotting with consequence over the
plain,
A worm in his progress remarkably slow,
Cry'd—"Bless our worship, wherever you
may go.
I hope our great mightiness won't take
it ill,
I pay my respects with a hearty good will."
With a look of contempt and impertinent
pride,
"Begone, you vile reptile," his antship re-
ply'd;
"Go, go, and lament your contemptible
state,
But first, look at me, see my limbs how
complete!
I guide all my motions with freedom and
ease,
Run backward and forward and turn
when I please.
Of nature (grown weary) you shocking
assay!
I spurn you thus from me, crawl out of
my way."
The reptile insulted, and vex'd to his soul,
Crept onwards, and hid himself in his hole;
But nature, determin'd to end his distress,
Soon sent him abroad in a butterfly's dress.
Ere long the proud ant, as repassing the
road,
(Fatigu'd from the harvest and tugging his
load)
The beau on a violet bank he beheld,
Whose vesture in glory, a monarch's ex-
cell'd;
Whose plumage expanded—'twas rare to
behold,
So lovely a mixture of purple and gold.
The ant, quite amaz'd at a figure so gay,
Bow'd low with respect, and was trudging
away.
"Stop friend," said the butterfly, "don't
be surprised;
I once was the reptile you spurn'd and
despised;
But now I can mount; in the sunbeams I
play;
While you must forever drudge on in
your way.

Moral

A wretch, tho' today he's o'erloaded with
sorrow,
May soar above those that oppress him
tomorrow.

Anonymous.

Ireland is indeed a nation among nations, its climate being such that all kinds of venomous creatures soon languish and die within its borders. As the "Venerable Bede" wrote in 620:

No reptile is found there; no serpent can live there; for often carried thither out of Britain, as soon as the ship draws near the land, and the scent from off shore reaches them, they die.

Works, Book I.

Geraldus Cambrensis, in the twelfth century, also subscribes to this belief. Flying in the fact of all tradition, he holds that the absence of noxious reptiles is due, not to the kindly intervention of St. Patrick, but to "some natural deficiency of the island." In our own barbaric times, much may be learned concerning the settlement of territorial disputes by applying some

Scanned with CamScanner

simple test similar to one which Cambrensis describes. Referring to the great controversy between England and Ireland concerning the possession of the Isle of Man, which is situated in the Irish Sea midway between the two nations, he states:

> Which country it rightly belonged to was a matter of great doubt among the ancients; but the controversy was settled in this wise: since the island allowed venomous reptiles brought over for the sake of experiment to exist in it, it was agreed by common consent that it belonged to Britain.

If we are to take Ben Jonson's word for it, it would seem that an effective substitute for rat poison in Ireland would be the use of sonnets; the number of Hibernian rodents being in inverse ratio to the number of poets. Referring to unfavorable critics of his works, Jonson suggests that drastic means be used in their extermination:

> Rhime them to death, as they do Irish rats
> In drumming tunes.
>
> *The Poetaster*, Apologue.

It cannot be said that Shakespeare was ignorant of the finer sensibilities of these rodents; for he has Rosalind coyly remark, à propos of the numerous sonnets penned by her admirer Oliver:

> I was never so berhymed, since Pythagoras' time,
> That I was an Irish rat. . . .
>
> *As You Like It*, Act III, Scene 2.

Nor is Ireland's near neighbor, Scotland, entirely devoid of unique creatures. The barnacle or Brent goose of Scotland is born upon a tree, and undergoes a "strange sea change" before attaining its pin feather. Butler, a contemporary of Shakespeare, comments upon its marvellous metamorphosis as follows:

> Whereas those scattered trees which natu-
> rally partake
> The fatness of the soil, send from the
> stocky bough
> A soft and sappy gum which from the
> fluxure moist
> Still great and greater thrive until you may
> well see
> Them turned into perfect fowles, when
> dropping from the tree
> Into the meery pond which under them
> do lie,
> Wax ripe and taking wing away in flocks
> do flye,
> Which well the ancients did among our
> wonder plaie.

Du Bartas enlarges upon this most curious phenomenon:

> Whose fruitful leaves falling into the
> water,
> Are turned (they say) to living fowls
> soon after.
> So rotten sides of broken ships do change
> To barnacles; O! transformation strange!
> 'Twas first a green tree, then a gallant hull
> Lately a mushroom, now a flying gull.
>
> *Divine Weekes and Workes.*

Du Bartas neatly solves that perennial question: Where do little frogs come from? He says:

> . . . as in a summer ev'n
> After a sweltering day, some sultry show
> Doth in the marshes heaps of tadpals pour
> Which in the ditches (chapt with parch-
> ing weather)
> Lie crusht and croaking in the mud to-
> gether.
>
> *Divine Weekes and Workes.*

Jumping a century, we now open the august pages of the *Spectator*, the most enlightened journal of English life. There we find a most vigorous editorial by Steele in which he inveighs against quackery. In fact, with a few changes it might serve as an editorial leader for the crusading *Journal of the American Medical Association.*

> It gives me much despair in the Design of reforming the world by my Speculations, when I find that there always arises, from one generation to another, successful Cheats and Bubbles, as naturally as Birds of Prey and those which are to be their food. There is hardly a Man in the World

> one would think, as not to know that the ordinary quack Doctors who publish their great abilities in little brown Billets, are to a man Imposters and Murderers; yet such is the Credulity of the Vulgar, and the Impudence of these Professors, that the affair still goes on, and new promises of what was never done before are made every day.

Nevertheless, advertising being then the rich source of revenue that it is today, and such being the frailty of our poor human nature, the following advertisement appeared within a few weeks:

> R. Stoughton, Apothecary in Southwark, having some time since, by order of a Merchant, sent 50 dozen of his Cordial Elixir to Sweden, has lately receiv'd Advice that great numbers of people finding it to be a great preserver of Health, drink it every morning. And further to assure it is so, hath a certificate from thence. He hath also a certificate from on board a ship to Jamaica, that after 6 or 7 of the men died in 24 hours of a malignant distemper, the Captain himself (fearing he should lose all his men) gave the rest, who were seiz'd, plentifully of this Elixir (which for many years he took with him) and by God's Blessing on it, saved every man after. He is not only willing but desirous that this be published for the good of others. The certificates themselves any gentlemen may see if they please.

Nor is the nineteenth century entirely without blemish with regard to the besetting sin of quackery. Did not the distinguished Edinburgh surgeon, Dr. John S. Smith, refer to it as a "thing that's not so bad?" It is to be hoped that his tongue was in his cheek when he wrote the following verse:

> This song refers to Quackery: a thing
> that's not so bad,
> Since nowhere else so many perfect cures
> are to be had:
> Each one from every malady will make
> you quite secure,
> And should it fail, another's quite prepared to work the cure.
> For nervousness, or listlessness, or bloodlessness combined
> With any other somethingness, a remedy
> you'll find.
> Which cures your gout, removes your
> corns, your whiskers helps to grow,
> Sets up your liver, oils your joints, and
> makes your juices flow.
> Quack! Quack! Keep it up, there's no
> disease so bad,
> But fifty perfect cures for it can any day
> be had.

And we, too, of the twentieth century must hide our heads in shame. Did not our own Sir William Osler have the hardihood to write the following verse in an effort to bring the gospel of fun to a very young patient?

> I will to you speed
> If you truly me need
> But meanwhile apply
> Three or four crumbs of bread
> To the edge of your head.
> If relief does not come
> While you spell the word thumb
> Take a hair of your mother
> Or sister or brother
> Cut it up very fine
> And take it in wine.
> No head can withstand
> A medicine so bland
> The ache will just fly
> Like the glance of an eye.
> For advice thus by post
> My charges at most
> Are a dollar a word.
>
> *The Great Physician,*
> *Sir William Osler.*
> E. G. Reid, Oxford University Press, 191, p. 103-4.

POETRY IN STUYVESANT HIGH SCHOOL

EVEN in these days of depression there is no end to the number of books being turned out by the printing presses of the country. Their authors touch upon a variety of subjects ranging all the way from the sublime to the ridiculous. This feverish industry in the literary field exists because, thanks to the schools, most people know how to read and write and like to indulge in both these pastimes. Thus an extensive market is created and writing becomes profitable. Instead of pondering their thoughts until they are mellow, people allow them full play immediately, and the worship of novelty insures their efforts public consumption. If the uninitiated need additional stimulus, they can find it at reasonable rates in the various university and home-study courses offered by well advertised minor writers. The majors in literature are affluent enough not to give such courses.

It is difficult to say whether the scholastic literary renaissance of recent years is a cause or result of these conditions. Personally, I like to think of it as being both result and cause; for the schools are as much influenced by as they influence society. The fact remains that the high schools have developed elaborate literary machinery. Every form of literature has its special coterie. The faculty advisers in charge encourage students to write essays, stories, editorials, and poems because they are able to offer a coveted prize —publication in the school newspaper, magazine or semi-annual. This tickles the ego of every adolescent as it does that of every adult. It gives both a sense of power and prestige not easily obtained otherwise.

Thus every literary enterprise in the world at large is paralleled in the schools with one important difference. Whereas those who pass judgment on the labor of adults realize that creative genius is rare and hesitate to use the label "creative" except in extraordinary instances, the pedagogue critics of student literary efforts allow their enthusiasm so much headway that they slap this adjective on anything which shows a fair degree of promise. This in an effort probably to encourage by praise.

As a result a "creative" epidemic is in full blast. Most of the poems, essays, and stories written by clever high school students are "creative"; their art work is "creative"; their reading is "creative"; their learning is "creative." In fact youth in general is "creative" in every way.

That is the question I propose to examine. Is youth creative? If it is then why are not adults as creative as youth is supposed to be? What happens to the creative spirit as we grow older? Who kills it and how? On the other hand, is it not possible that we as teachers have become intoxicated with the fine results we have obtained in making youth articulate that we have ceased to be realists in this matter? The answer must be —and I want to state it emphatically —that young people are not even as creative as their elders. Creation like reflection is not an instinct but a habit, and it takes time to develop. In fact, the vast majority of all people, regardless of their ages, are happier on the beaten path than on the untried byways. Only the exceptional venture forth alone to seek the new. Any other view, I think, would tear to shreds the behavior patterns so painstakingly mapped out by psychologists and sociologists.

Youth is experimental. It must be, for it has no fixed rules to use as guides. In its fumbling and stumbling, in its attempts to learn by trial and error, youth can see only one fixed star in a whirling nightmare of change the world adults have made. This star the young and inexperienced alternately accept and repudiate as optimism or pessimism grips their unstable emotions and intellect. This is as it should be because experimentation is always born of uncertainty and prepares for the creative act. Of course, creative is here used in the more or less literal sense to signify that which has been fashioned from pre-existing material into a new pattern. An act of creation can occur in a flash; but the ground must be carefully fertilized. It can be done only by fully mature men and women who have abundant tools with which to reshape this material according to a crystallized purpose and vision, usually known as talent or genius. Such people as these never represent more than a tiny fraction of the population. Given time and opportunity, a similar fraction of our clever youngsters may find themselves within the ranks of these chosen few—this aristocracy of pioneers. The most that can be said for these youngsters is that they are on their way.

We may, therefore, expect the literary output of our high school boys and girls to be imitative, emulative, derivative, critical, even cynical, but not creative. To prove my point I shall take the liberty to quote from the prose and poetry written under my direction during the last three years by members of The Literary Society of Stuyvesant High School.

In December, 1932, Edward Ressler was studying Tennyson's "Idylls" in an English 6 class. His teacher, Mr. Astrachan, in charge of the school magazine, *The Caliper*, needed material and promised extra class credit and space in the periodical to the student who wrote the best "Thirteenth Idyll." To the tom-tom music of an Eberhard lead-pencil Ressler beat out his poem and won all the honors, including a gold medal.

Gutham, "a king of former years," came to Arthur's court and told his tale of woe:

"To North and far,
Two hundred leagues and more, my people live;
A happy people once, but now o'erset
With deepest grief and anguish all untold.
'Tis why I have grown old in early life.

" 'Tis naught but work of one, a stark crazed fiend,
Malin he calls himself, and prideful, too;

Scanned with CamScanner

He terrifies us with his men—more beasts
Indeed than men; of monstrous strength
are they
And taller yet and stronger still by far
Than any man or beast upon this earth.
In truth, another stratum lower yet
Than man, these heartless giants do repre-
sent.

"Their eyes but hollow bulging
orbits on
A face of smoothness truly uncompared;
Their hair, full five feet long and black
as night,
Disheveled and unkempt, hangs to their
arms;
Their faces,—empty,—void of interest all,
Of smile, of frown, of laugh or cry, of all
Save that of change from sleep to wake-
fulness.

"All men who would have con-
quered them have naught
But death's reward and, aye, yet worse
than that.
They know no peace; sweet sleep is them
denied,
For yet though dead they serve the Giants'
will.
At each new moon we see them from afar
By its youthful glow; each holds a spear
And marches round a tower thrice, while
light
In chaos plays about the thunderous heav-
ens.
And when they are no longer to be seen
Each of us, weeping, fills their pit with
plenty.
Deep and wide it is with sloping sides
On which, pace after pace, are many
stakes
Inset—a score of cursed stakes in all.
Oh cunning monster, they! For ere the
night
Fades into the dawn, the hole to full
Has to be filled, or Death, untimely Death,
Fells us with its cold and tranquil breath;
Ten men for every stake that eye can see.

"But now, oh King! The hole is
deeper dug:
Naught but its full wish they in human
tolls.
Impatient beasts! The pit has overflowed.
Two months have passed since then and
many a score
Have I,—oh coward—led away, all tied,
In fear that all my men might else be slain
With one great blow. A foolish thought!
If not
The beasts, then surely time would finish
all.

For all are doomed in that unholy town.
Those that these evil giants do not kill
At once will waste to death, waiting to die.
By purest chance have I escaped their
watch."

So saying Gutham kneeled and
bowed his head. According to the
well known formula, a brave knight,
Charlott by name, begs King Arthur
for permission to deal with this Malin
and his men. The King grants him
his wish and away he rides with
Gutham to beard the lion in his den.
Gutham doubts whether a single man,
no matter how brave and skillful, can
manage this business, but leads the
way and holds his tongue. After an
arduous journey they reach the mon-
ster's home, "a castle deathly black."
This castle is pictured in all its gar-
gantuan awfulness.

And as they nearer rode they came
upon
A tree. And from a limb there hung a
sign—
A dreadful sign—its message made in
blood.
"He that this horn in foolishness doth
blow,
Another foolish act he will not know."
So read the sign. And from the strongest
branch
There hung a horn; enormous was its size.
And skulls and bones were painted all
around.
Some yards away there was a pit. And
from
The pit stood men, their hands upraised,
their lips
Apart. Though dead and mute, they
lived and spoke.
Away spoke lips, away flashed eyes, away
Each hand did point, and all away, away

Charlott does not heed this warning.
He seizes the horn and blows "a long
shrill blast." Amid the flashing of
lightning and the crashing of thunder
the drawbridge is lowered by invisible
hands. Gutham, overcome by fear,
begs Sir Charlott to fly before it is

too late. But NO! Charlott spurs
his horse, reaches the bridge, raises
high his mighty sword and swings a
"mighty blow" at Malin's men.

A contact! Crash!
A roar! And then——

Lo and behold! It all
Had changed. Of monsters six naught
could be seen.
The thunder stopped; the lightning ceased;
the wind
No longer blew; and dark black night gave
sway
To faint sweet blushes from the distant
east,
The tranquil herald of a lovely dawn.
The castle door had opened to its full
And from there came a people all ajoy;
And when the last came from the castle
grim,
A sound that caused each heart and every
breath
And every limb to stop be-rent the air,
As if a sword had reached a monster's
heart,
And it, afraid to die, in frenzy clung
To its departing strength. But all in vain!
And when that thinnest shred which held
life snapped,
It spurted out its life in that last gasp.
The pit closed up, and where the castle
stood,
A blooming meadow came to grace the eye
And draw contentment's soft sweet sigh
from all.
And all fell down and kissed Sir Charlott's
feet
In blessings great; and then, with heads
all bowed,
They clasped their hands and thanked
Almighty God.

These eighty-five lines give the full flavor of this 160-line narrative poem. It is what it was intended to be—a conscious and premeditated imitation of Tennyson's "Gareth and Lynette." The characters, like Tennyson's, are inconsequential shadows. The plot creaks just as much under its load of romantic machinery. The blank verse echoes the poet's haunting melody. The macabre details are probably de-rived from Poe whose stories and poems are read in the same term of English.

Again as in Tennyson, the optimistic criticism of contemporary affairs woven into the allegory is the thing which transcends all else in importance. Sir Charlott breaks down an almost insurmountable obstacle easily because he has the courage of his convictions—a trait we sadly lack today. What he finally liberates is not a fair lady but a group of people glad to be free again. Who this Malin is who had them in his dark grasp before, it is hard to say; but even at the risk of being accused of straining a point, I shall suggest that this ogre is not despair, but depression. After all, when the depression is finally forced to give way to prosperity, it will then appear to have been so simple a task that we shall probably laugh at ourselves for having been such children to allow a figment of our imagination to scare us so long. If Malin is not depression, then he must be cancer.

Whether all this ran through Edward Ressler's head as he wrote his "Thirteenth Idyll" I do not know; for me it is enough that it runs through my head as I read the poem. This thought-provoking quality, plus its high seriousness and honesty, cloak this poem with sufficient merit even though I realize fully that it is imitative, derivative, and critical rather than strictly creative. To call it creative would merely befuddle our thinking and would add nothing to Ressler's achievement.

This seems to be the opportune moment to digress slightly and point

Scanned with CamScanner

out that as far as my acquaintance with young people goes, their humor is only potential. This explains why Ressler did not write a parody of Tennyson's "Gareth and Lynette," why none of my young friends ever wrote an amorous poem that was not mawkish, why I would never recognize the following as "A Satire" if it were not so labeled.

FOR NOMINATION (A SATIRE)

My friends from the rockbound coast of Maine
To the place of the running tide,
From the northern shore where folly ends
To the heart of the rim-round-eyed.

A man of noble strength and such
A sport he loves us all;
A man whom very few can touch—
Oh! Hear your country's call.

Vote for him on election day.
He'll clean the country, raise your pay.
A foe of want, a friend of gain . . .
He'll bind again the union chain.
And so I place before you
Sir Lucifer D. Gust
Our slogan for the country?
"Vote for Gust or Bust!"

—*Harold Meyers.*

These verses appeared in the January, 1933 issue of *The Indicator,* Stuyvesant's semi-annual, in charge of Mr. Mostow. They no doubt emulate in a crude way the type of verse that appears in the dailies, especially at election time. Harold Meyers could not have written a poem such as this in January, 1931, when I first met him because at that time he had not yet had the experience of being a candidate for or an officer of the G. O. or a campaign speaker for any other candidates of his party. In fact, I doubt whether he had a party then. But to me his poem is important because of the expressed criticism of present-day conditions and the implied criticism of human nature contained therein. This criticism, however, is far from cynical.

For youth, as a rule, is idealistic. Of course, there are exceptions to this as to all other rules. Of the hundred or so boys I knew intimately in the past three years, only three were in any degree cynical. It happens that these three are all disciples of Louis Zukofsky and his school of "Objectivists." This may be a mere coincidence or not. I do know that none of us are immune to this quality and that sometimes, like Shelley's west wind, it purifies. My theory is that my three pessimistic young friends were so, precisely because they were the most mature and the least sheltered of all. Incidentally they were the only boys I knew who loved words for their own sake, who could combine words in striking patterns, and who felt that words had a reality and an existence all their own. This power in their case sometimes led them to pull words out of a hat as a magician pulls rabbits. In their poetry there are echoes not only of Louis Zukofsky, but also of Ezra Pound and T. S. Eliot. Finally, I shall pay them the greatest of all compliments—publication meant practically nothing to them.

GOOD SNOW

Good snow, Sunned ocean whitecaps
breaking beneath my feet.
My light myth carpets, where do we go
this morning?
Inside me, outside me, the air, flurrying
snow and wind.
Into a thoroughfare of fishmongers, into
The mob of bargaining red-handed women.
Smelling reminiscently; from cart-cries and
crowd I walk
Long-strided into a park.

Sleighing children down the white hill,
Shouting, belly-whopping,
Laughing past the thin trees with (whizz)
Red mufflers flying.
I, spying the pond, slide on wet leather.
On the boulevard, laughing.

—*Jerry Reisman.*

A POEM

Green light means go,
Grit teeth, catch clutch.
Having walked in the park,
Heard litany in the tree arbor,
Felt the voices rushing in a breath of air,—
"Come all ye unto me—"
Seen, coral shades of leaves
Fall in the rain.
We rode in the omnibus of blank
Silent faces,
The deep grooved paint of yesterday,
And spoke the incomprehensible
In the silence of our brain.
Let fall
All believable and practical
Into the pool of duck-laughter,
The full half-laugh,
Of the simple tickle of the vertebrae.
We pulled
Our wet selves out of the rain, the
Steaming smoke of a deserted street.
And paused one moment under the lamp,
A vivid eye of the tree.

—*Harry Ladizinsky.*

Instead of quoting a poem by the third member of this trio, I shall quote an essay in which he explains the philosophy of art and life which he and his friends derived in emulation of the "Objectivists" and perhaps Shelley.

DEFINITIONS

It is impossible to conceive an absolute critical hierarchy. Creative work is necessarily tempered by the actuality of time and of place, and any criticism of present or past work can only be arrived at by a conception that is actual in the sense of time and of place. To criticize we work upon the premise that the poet is not introspective. If we are to speak of the external differences of a horse, an apple-tree and a tiger, we are confronted by no difficulties because these things are actual. But if we speak of their souls, we can only do so by using the arbitrary God or Lucifer—this is not actual to the horse, the apple-tree, the tiger or to ourselves. Thus in speaking of a poem we can conceive only styles; the thought is arbitrary, conversation is non-existent.

Thus style is creation.

To create is to destroy.

If in reading a poem one's whole pre-conceived idea of what poetry should be is destroyed, if he senses a crack in the pottery, a fruit unrelated to the tree, then he has read a poem.

In writing a poem the word predominates over the thought. We should attain the vision of Judgment Day. We should see each word in its relative position separated from thought. The word then has a certain acid quality. Connectives have disappeared.

A poem!

—*John Dwyer.*

If it be remarked that here at last we have creative work, I shall object as strenuously as before. True, a crystallized point of view is present here to some extent; but it is still groping for the full light of day, and even if it were not, it must not be forgotten even for one moment that it is a point of view original not with the students here represented, but with individuals exterior to themselves.

I can enjoy their work for what it is worth without mixing my terms or

Scanned with CamScanner

my ideas. Some day these boys, when they are no longer young, may look back upon this work of theirs as Edgar Lee Masters looks upon his "Doomsday Book."

Now for a second digression in which to relax and enjoy the most successful humorous poem I came across in my three year experiment. The poem is sheer nonsense, interesting only because it is brilliant and reminiscent of *The New Yorker*.

PARADOX

If ears could tell
the tales they hear . . . oh dear . . .
what things they yet might spell.
(Poor mute conchoidal shell.)
If lips could hear
they'd loathe to mouth
the awful tales THEY tell.
These portals would not be
such hell
—were eyes to see—
nor would they knell
like tolling bell;
our empty minds
could not with admiration swell.
(They turn our lines pell mell.)
O well,
our senses can't excell
dissolve
nor jell . . .
So what?

—*Arthur Stern.*

I come now to a group of poems by Alexander Epting, a boy who has, according to John Ruskin, the greatest of all gifts, eyes that can *see* and a tongue that can tell these observations. He also has a heart that can feel the spell of nature in her more colorful moments. Nor is he guilty of the pathetic fallacy; probably because he has come in contact with nature herself instead of with poetic accounts of her. Creative poetry it is not; for William Wordsworth lived and wrote before Alexander Epting.

VALLEYWARD

Down from the mountain pasture to the valley,
Down from the wild grass to the quiet fold,
The young calves journey, through a scarlet alley
Of sumac, leaving the briers and the gold
Caverns of beech-woods. Slowly bawling and crying,
Their soft hoofs thudding on the tangled ground,
The young calves journey down at autumn's dying,
Drunk with the first sweet summer they have found.

SPRING RAIN

The rain is coming down
In gleaming, shining streams,
And through the crystal drops
The sun still shyly beams.
Here in the meadow
I have forgotten care and pain.
I have forgotten everything;
I am running in the rain.

NOT THAT IT MATTERS

I like turtles on a log
And flagpoles slim and tall,
Beachwoods gray in twilight fog
And crickets' poignant call.
I like spider-webs in dew
And tinkling strings of bells;
Slender moons, alert and new,
And tales a robin tells.
All these things will go right on
Without regarding me . . .
Clouds will flush at coming dawn
And tides still sway the sea.

Alexander Epting's next poem, "The Ruthless," introduces us to a group of five poems which defy classification; therefore we shall classify them as miscellaneous. Nietzsche would have applauded the message recorded here.

It is not the strong
I fear,
But the weak.
Their clinging fingers
Are like water creeping
To undermine
The stout foundation,
And like water
They turn suddenly
To seek a new course.
In the end
It is the weak
Who are ruthless.
Protect me
From the ruthlessness
Of the weak!

In the next a childish prank is given memorable expression.

THE SEXTON

The sexton, going his rounds,
Hears the choir at hymnody;
I go up to greet the hills,
Green hills roll down to me.
Not for me will vesper ring,
Sprinting down the crooked lane;
Nor for the whitecaps on the sudden sea,
Nor for lightning in the rain.
While he is tending candle-wick,
I may be baiting hooks with flies,
Or racing wild and quick
Past the church where his life lies.

—*Edmond Arbib.*

The writer of the following shows that he once read Gray's "Elegy."

ELEGY

I own an easel in a far-off land
That none may see,
And there a piece of canvas still unstained
Belongs to me.
And I could take the sunset in my brush
And lay it there;
But not without your crystal voice that's lost
In breathless air.
The sea was blue, the meadow grass was green,
Now all are gray;
Your voice that was the gentle whisper of the wind
Is gone away . . .
I own an easel in a far-off land
That none may see,
And its unblemished white may be touched by none,
Not even me.

—*F. A. Zambetti, Jr.*

The next poem has a strange history. It was written about a year before Edison's death. Afterwards its author dedicated it to him because of its fitness.

DEPARTED

Dedicated to Thomas A. Edison

Gone—
Like the last rays of the sun
Over the hill.
And like the sun at noon
His life was beautiful,
Shedding light.
And we,
Bewildered children that we were,
Stood and watched
In wonder.

—*Harold Meyers.*

The next is last because it explains in four lines the struggle that goes on in every adolescent's breast as he seeks to become articulate.

GIFT OF SONG

The man whom I call poet
Is the mute who labors long
To tell the world the thoughts of his soul
Though he's given no gift of song.

—*Harold Meyers.*

CHARLES AUSLANDER.

Stuyvesant High School.

THE DEAN AND DISCIPLINE AT GROVER CLEVELAND HIGH SCHOOL

Notes For A Study of Character Training

WHEN the dean assumed office last September it was clear to him that attitudes of both teacher and pupil needed remaking. The dean's office was not to be considered the whipping post of the school, nor should the dean be a mere character accountant for the school, recording the pettiest offenses and loading the card files. Rather should the office be a place of adjustment where school is made to adjust itself to the child

Scanned with CamScanner

and child to school—where the individual pattern and the society pattern are harmonized. Rather should the dean busy himself with the task of inculcating the notion that discipline is character formation, constructive as well as corrective in its aim, and as such a function of the classroom teacher rather than that of any appointed officer of the school.

I

His task defined, the dean marshalled the forces of the school to aid him. As chief aid he had the most rigid, prompt, and efficacious coöperation of the principal who, realizing the importance of the task, devoted the conferences of the term to different phases of discipline. The dean addressed the first conference, at which he said in part:

"Constructive discipline means that method of procedure which will result in getting students to make the most of their opportunities and not the least; and which from our point of view, means making the most of these opportunities with the least infringement on the rights of the rest of the children of the school. We can readily see that a child interested in art and not in accounting may be found drawing pictures during his accounting period. If we were to permit this, we should be advancing the individual wishes of one student and lowering the total efficiency of the accounting period. A student interested in health education might cut a period for the purpose of taking a walk or a run outdoors, therefore lowering his usefulness in an English class, or any other. To attain our end, then, it is necessary to build programs allowing the greatest possible scope for individual development, maintaining at the same time a general program which will work for the best advantage of the student body as a whole." . . .

"A child becomes a discipline case when he wishes to follow a pattern of his own in conflict with the one laid down for him by the school. Our problem consists in bringing him back to the school pattern or the class pattern or the group pattern. Now comes the method whereby this change in conduct is to be effected. Heretofore, it has been the duty of the dean, through punishment, to make life so unpleasant for the offender that the school pattern becomes less obnoxious than his own plus the punishment involved. It is our purpose to study reasons for departure from the school pattern and methods for return that will be constructive rather than punitive. We shall find that we teachers are very often contributory agents to the dereliction."

Three other conferences were held during the term, each studying the problem from a different angle.

II

In addition, the dean prepared the following short discussion of the problem for teachers' guidance:

About Discipline

The problem of discipline divides itself, for purposes of administration, into two definite classes:

1. Discipline within the classroom.
2. All other discipline.

It is with the first class that this paper will largely deal, for it is here that the greatest change must be made.

This change must come about through a realization (on the teacher's part) of responsibilities, and a study of all the factors that go to make up the well-ordered class.

The teacher must know at the outset that he, and he only, is the man responsible for proper conduct of pupils within his room and under his guidance. He must know that an appeal to outside power, unless imperative, is an immediate admission of his own inability to cope with a situation or a pupil. A discipline case is something that concerns the teacher, *and must be solved by him* or he is unworthy of the name. If the case is beyond him, his first appeal is to his chairman, and if a solution cannot be found by either teacher or chairman, or by both of them, and home contacts are desired, and law is invoked, then the dean, administrative assistant and principal, in the order named, are called into the matter.

Problems arise through a variety of causes. A few of the chief ones are noted here:

1. Teachers themselves are not agreed as to what constitutes proper conduct. Teacher A requires students to proceed immediately to their seats on entering the room, whereas Teacher B considers the five-minute interim between lessons as a rest or recreation period and allows students to stand in groups and chat, look out the window, and so on. In the recitation itself, Chairman C calls children by row or by some definite system, while Chairman D wants his classes to be so violently excited by the lesson that the pupils spring from their seats unbidden. In other words, there are as many behavior patterns as there are teachers. And we expect children to go from teacher to teacher and conform to all these patterns, remaking themselves en route!
2. The lesson that abounds in interest is never disorderly. You will say that some children (those waiting for work papers, marking time until discharge, for example) interest themselves in nothing. Quite true. But this fact is equally true: These few will remain merely inert, quiescent, doing no work, *but never actively annoying*, if the vast majority of the class are keenly interested. These few malcontents will never oppose the *esprit de corps* of the class.
3. As a corollary of the above, the teacher must know enough not to provoke trouble by attempting the impossible. He must not force issues that will not be forced. He must not go to such pupils and demand work in equal measure and of equal standard to that presented by the rest of the class. Nagging

Scanned with CamScanner

and calling names get one nowhere and react unfavorably on the teacher.

Dr. O'Shea, in his recent report on Character Training, asserts that good character is the end of all education; and subject matter merely the vehicle through which that end is attained.

Procedure

In cases of classroom difficulty act as follows:

1. Study the case and make every effort to solve your problem. Keep a written record of your attempts. It will be asked for if the case comes to the office.

2. In the event of failure, consult your chairman.

3. If both efforts are still without success, report the case to the dean. The student is not to be excluded from the room except by order from the office.

If teachers understand that their own record is on trial fully as much as that of the student, they will be less eager to report trivialities such as at present appear as formal charges on pink cards now on file:

1. "He was eating peanuts in class."

2. "He answers me back."

This does not mean that the dean's office will have nothing to do. Cutting is a serious offense, and one which, while some reflection on the quality of the lesson skipped, is matter for the office. This, with truancy, disorder on stairs, in hall, or on school grounds gives the office more than a day's work.

If all classroom work, care of halls, lavatories, auditorium, and school grounds can be so efficiently managed by teachers and service squad that the office of dean can be abolished, no one will be better pleased than

LOUIS L. CARDOZO,
Dean of Boys.

III

The following cases gathered from the files, are interesting in showing the types brought to the dean's attention and the method of treatment.

Case One

This case was called to the attention of the dean the day before the final examinations. The chairman stated that the boy had failed to appear for his mid-term examination, giving as reason that he merely did not wish to take it. He refused to take a make-up examination at a later date.

The situation at this point became even more interesting when, in response to the teacher's comment the day before the examination, "Now, Angelo, we certainly expect to see you at the final," the boy's reply was, "I shall not be at the final examination either."

The case was referred to the chairman of the department and the boy persisted in his determination to absent himself the following day. He gave as his reason the fact that he was failing now; the fact that he was doing well in three other subjects and that he saw no use in wasting time in preparing for a hopeless cause or in attending an examination where he could have no hope of success. The chairman threatened, first, an appeal to the boy's home, and, second, parental pressure. All to no avail.

Both chairman and student were obdurate and the case was referred that afternoon to the dean's office.

The dean was here confronted with two problems.

1. The task of getting the boy to do what seemed to him to be an unreasonable thing, and

2. "Saving the face" of the chairman and teacher who actually were trying to force him to do an unreasonable thing.

When the boy appeared, the dean used a little scheme that he has employed very often to establish an *entente cordiale* with recalcitrant pupils. He noted the name and, without making any reference to the misdemeanor that brought the boy before him, he asked the boy if he knew what his name meant. The boy answered, "Yes, it had to do with an angel." The dean quietly remarked that he wondered whether his position with regard to his examination and his stubborn stand against his teacher were particularly angelic. The boy smiled and said, "Well, perhaps not."

The dean then asked about the boy's rating and progress and found him to be a very fair student in all subjects other than the one in question. He said to the boy, "That's excellent, because there is always hope when dealing with intelligence." This further broke barriers. He asked the boy whether or not he knew the purposes for which examinations are given, and the boy replied, "To see what I know about the subject."

He was further questioned as to the value of examinations to the teacher, and his reply was, "So that he may know what I know about the subject."

It was then pointed out to him that the examination is a measure of a teacher's success as well as that of the pupil's success. He was made to see that an examination furnishes a test of methods, that is, a teacher of five classes may want to know whether the class which had a maximum of laboratory work or text-book work or lecture work or note-book work or socialized recitation or project did appreciably better than the other. He was asked whether or not the examinations were of any special interest to the chairman, and he was more quickly brought to see that the chairman was interested in the examination as a measure of the value of methodology and in comparing and estimating the work of teachers. Then, when he was asked the value of examinations to the principal, he smiled brightly and said, "Now I see. The principal compares one department with another and that department in his school with a department in another school and his entire school with other schools in the city. I'll take the examination."

The dean in this instance was placed in a curious predicament because he was compelled to resort to specious argument in order to get the boy to conform with school rules, and, at the same time, support a teacher who had made a wrong decision and a chairman who had threatened home

Scanned with CamScanner

interference where home interference had no legitimate application. The boy's reasoning was sound, and his willingness to take a zero rather than waste time in order to attain little more than a zero, was commendable. However, school discipline was served —the boy was led to see his small portion in the social scheme of things; both chairman and teacher were seemingly upheld and the boy was present at his examination on the following day.

Case Two

The case of Amorino presents very much the same background as the preceding one. Amorino was present with a number of his companions at the school's business show one afternoon after three. The show was held in a gymnasium, crowded with students, teachers, and parents. Feeling the lack of very definite restraint, he engaged in friendly jostling with some of his fellows, and ended by hitting one of them a resounding whack on the back of the neck.

At this point, a teacher put his hand on his shoulder and drew him aside. "What do you mean by that?" said he. "Why, we weren't fighting; he's a friend of mine. We were only fooling," answered the boy. "But that is no way to conduct yourself," said the teacher. "Well, maybe it was wrong," said the boy, "but it was only a little thing." Then the teacher gave utterance to some words which the boy construed as a reflection on his family. The boy contends that the teacher's words were, "You must come from a very fine family, that teaches you conduct like that." The teacher states that he does not remember exactly what he said, but that he wished the boy to understand that somehow or other the family and the boy's conduct outside were bound together. The boy answered rather heatedly, "I think what I did was very little. If you want to scold me for that, all right, but please leave my family out of it." On the teacher's insistence with regard to family, the boy became somewhat belligerent and said, "All right, if you insist, I have four big brothers at home anyone of whom will be delighted to come up here and show you what my family can do." At this point the dean was called in.

Upon Amorino's appearance in the dean's office the next day, the attention of the dean was attracted to a name which has to do with love. This boy also was aware of the fact. The dean's opening words were, "I hear, at least, one thing about you that I'm glad to hear. I am glad to hear that there is such fine family unity at your home. Be proud of it, young man. Be proud of your parents and your fine brothers and sisters. There is no teacher in this building who would try to destroy the unity."

It is the wish of the dean, in each instance, to allow the time element to enter in order to have passions cooled and to establish somewhat of an amity between the culprit and himself, because antagonism has worked sufficient mischief. For this reason the case was not handled until the morning following the misdeed.

The boy was asked whether he went to church. His reply was that he did. He was then asked whether he went to Coney Island. He looked surprised, and answered wonderingly, "Yes," to that. He was then asked if he engaged in horseplay while at the Island and upon his answering in the affirmative, he was further asked if he ever indulged in that same spirit at church. Here he broke in, "I see what you mean. An action which, in itself, is harmless may be harmful if carried on in the wrong place." That settled the question as to whether or not the initial act was blameworthy.

Now came the question of his attitude toward the teacher. If the teacher had said what the boy alleged, the teacher himself was clearly culpable. It was the duty of the dean, therefore, to convince the boy that he had not heard clearly, or, if he had, the dean was sure that the teacher intended to convey this idea: "Any act of yours whether for good or evil, reflects either good or evil on your family." That is quite different from saying, "You must have a terrible family because they have brought you up in such and such fashion." The boy was made to see the truth by questions such as, "If you receive a high mark in school, is your family pleased? If you win a race and receive a medal, does that reflect credit on your family? Does this fine solid gathering at home rejoice or is it cast down if report comes that you have disgraced them by some unseemly act?"

This talk took not more than ten minutes and was ended by this remark on the part of the boy, "I get you. What I did was wrong in the first place. Now, if you are sure that Mr. ——— meant about my family what you say, I am deeply sorry I said anything as ugly as I did. May I go up to him now and tell him so?"

On the following morning, Mr. ——— came to the dean and said that a wonderful thing had happened. He said he was so convinced of the boy's sincerity in the rough apology that he was moved to offer his hand to the boy and say to him, "Do you know, my boy, now that I have reflected carefully, I really believe that I said the mean thing about your family that made you angry, and I apologize to you also."

These two cases resulted from the clash of personalities and called for adjustment between teacher and pupil.

The next two reveal the common case of an individual who, because he is in the fore-front of school consciousness, presumes to excuse himself from obeying necessary school regulations.

Case Three

Two members of one of the school teams were reported for cutting, being out of the school building and offering violence to service guards who opposed their leaving the building. Here the individual had not learned to subordinate self for the good of the group. Drastic action had to be taken Both boys were immediately suspended from their teams. It was the effort of the dean to have them realize that the

Scanned with CamScanner

aim of the school is the highest individual character development consonant with development as members of a social group.

Case Four

A boy was three times guilty of interference with service men. Not until it was found he was one of the trusted service men to the Health Education department could we make effective any appeal to loyalty to officers of the school in general. Here the boy felt himself two personalities, that of top sergeant, and that of private in the ranks rebelling against other top sergeants. As top sergeant he was made to realize the necessity for a feeling of solidarity to the rest of the guards for *esprit de corps*.

In rare cases does the dean call on the home. As professional trainers, as students of psychology, teachers should be able to handle most disciplinary problems. It is a mark of shame to call on parents in cases beyond our control. The following are such as compelled the dean to resort to the home.

Case Five

The son of an orchestra musician is himself a musician in a boys' orchestra which occasionally is engaged to play at dances. It was originally thought that these engagements were responsible for his excessive lateness. The boy was told that school was his first job, and unless he came early he would have to give up the orchestra. This did not help and, to investigate further, his mother was summoned. His mother, when she finally came, thought that all that was necessary was the explanation, "You know this boy is just like his father." The boy, according to her, and the school should resign themselves to his destiny to be like his father who, she said, also rose late. Upon further questioning it was disclosed that although the boy's father rose late, he had always been a half hour early for his engagements, which usually came in the evening. It had never occurred to the mother that school was the son's job and that it was her duty to help him do his job well. The added scheme of having the boy report to the dean before going to his official class was used for a while. This student has never been reported since.

Case Six

A boy was charged with excessive lateness and frequent truancy. His was a background of wealth. He was dressed in the height of fashion, wearing expensive neckties, silk socks, and several suits a week. His general appearance told us that he had an abundance of this world's goods. After attempts at talking things out, the dean summoned the parent. Surprisingly enough the father said that he knew of his son's delinquency, but that he did not seem able to buy him into better behavior. He said, "I give the boy everything in the world he asks for."

The dean's task here was to show the father that punctuality was a character asset which required training rather than buying. It was a matter of treating the parent rather than the student. It was necessary to shock the parent into his duty. When the father, after being told that it was time for him to do a little commanding, still showed tendencies to softness, the dean talked law to him, told him that his boy would be taken from him and placed in a truant school and that he, as parent, would be charged with improper guardianship. We haven't heard from the boy for the last two months.

The problem here was not the uncommon one in which home acquiescence and amused tolerance with delinquency have to be broken down.

We record these efforts not as boast. We have not been infallible. We are merely students of human nature and as such make this our contribution to the general study of the problem.

WILLIAM N. STERNBERG,
Assistant Dean,
September, 1932 to February, 1933.
Grover Cleveland High School.

HIGH POINTS

The Verse Speaking Choir

Ingenious devices to develop and stimulate an appreciation of poetry are frequently presented to teachers of English for their approval and use. Many of these devices arise from an inference that poetry is an intellectual problem to be solved by a careful analysis, unmindful of Wordsworth's warning: "We murder to dissect"; others arise from an attitude which looks at poetry as the necessary hurdle to be cleared in the English course. Fortunately, however, most educators still believe that any successful method should include at least a preparation of the students' mind, an orientation to the ideas, emotions, problems presented in the poem, and, as a climax, simply a good oral reading. Certainly, no method based on these two basic elements can fail to attain one of the primary aims of poetry study: the reading of poetry for enjoyment; for there is no better way to enjoy a poem than to read it aloud:

"Then read from the treasured volume
The poem of thy choice,
And lend the rhyme of the poet
The music of thy voice.
And the night shall be filled with music
And the cares that infest the day
Shall fold their tents like the Arabs,
And as silently steal away."

An excellent method of studying poetry for enjoyment and profit, and one which takes advantage of the value of oral reading, is the verse speaking choir, originated as the Oxford choir. It is an activity wherein group participation in oral reading of poetry is employed to derive the most benefit and enjoyment from poetry study. For the choir, best results will be obtained by using from ten to twenty students, although as few as three and as many as forty may be used successfully. As a means of accustoming the students to the novel

Scanned with CamScanner

procedure and freeing them from over-restraint, the leader reads one line or convenient breath group of the poem aloud, and the choir repeats it in chorus. This initial procedure continues until the entire poem, a short one to start with, has been read. While this method tends to produce a mechanical and strait-jacketed reading, it is useful for freeing the student from the fear of hearing his own voice raised in an individual and conflicting interpretation; it permits him to break free from restraint in the comparative shelter of a set voice pattern. The leader, by express words of inspiration and by his own spirited and sincere reading, should urge the students to speak the lines with conviction and feeling.

After a few simple poems have been studied and read in this fashion, with the better readers having acted as leaders a few times, the entire choir now reads a poem in chorus without following anyone. Attention should be paid to thought values as well as to rhythmic patterns. While some attention should be paid to keeping time and reading in unison, the emphasis at this step should be on individuality of interpretation and freedom from restraint—the natural outcome of varied ideas and sincere feeling.

With many poems, the changes in mood and sound devised by the poet can be brought out effectively by the use of different voices, as in a singing choir. Thus, where the poem is light and gay, we use lighter, higher, girlish voices; where it is solemn and slow, we use heavier, manlier ones—the corollary of Cyrano de Bergerac's "gay for a woman, sad for a man"; and where it is forcedly gay or drear, or both gay and drear, or neither, we use all voices. Various combinations can be tried effectively, almost as in music, to indicate conflicting moods or different types of characters, or to show the changes of plot or emotion in the poem.

Gestures and pantomime should be encouraged, especially when they arise spontaneously from the feeling of the student. When the poem becomes so vital to the student that his emotional or mental enthusiasm is expressed in terms of physical movements, appreciation is at its height. In one reading of "Caliban in the Coal Mines," some students stood calmly with eyes lifted, others gesticulated, others kneeled slightly, and others merely read quietly with no evident physical expression. Yet, before the reading, they had all agreed on a fairly uniform interpretation of the ideas, meaning, and feeling of the poem. Theoretical similarity had become actual variety. Appreciation is indeed heightened by this both individual and group participation.

A wealth of suitable poetry is available for the verse choir. Poems which have the necessary rhythm and auditory appeal abound in anthologies and collections. In general, it is better to work with poetry that has universal and emotional, rather than limited and intellectual, appeal. Shakespeare, in his songs, Burns, Coleridge, Keats, Tennyson, Arnold, especially in "The Forsaken Merman," Swinburne, Housman, Kipling, Yeats, Masefield, Noyes, Lindsay, Poe, Whitman, Lanier, S.V. and Wm. R. Benet, De La Mare, Millay, to mention only a few, furnish poetry that combines with recognized literary values all the necessary elements for effective group reading. The verse choir can easily utilize much of the poetry studied in the English course.

The net results of the verse speaking choir are indeed worth-while. Most important of all, there arises an appreciation that is whole-hearted and sincere, because it is based on a multi-sensual appeal. Aside from an increase of interest in poetry and knowledge of specific poems, the desire is awakened for clear understandings and veracious interpretations. The improvement in voice, diction, reading ability, and general speech habits is often marked. Most pleasing to those who advocate pupil activity is the opportunity for self-expression. The verse choir is a socialized procedure combining the virtues of unhindered expression and reasonable self-control; it is a training in coöperative work to produce a satisfactory result. These are reasons enough for the more extensive use of the choir.

GEORGE B. RABINOR.
John Adams High School.

A Device For Drill In Grammar

In the hope of helping the modern foreign language teacher in his search for ways of making drill interesting as well as efficient, I submit the following device. Its appeal is based on the competitive spirit, the class being divided into two teams for the drill. It is essential that the questions put to the members of both teams cover only one grammatical point at a time and that the answer required be very short. In order to keep the whole class attentive to the questions, the following rules are instituted. If a student on one team gives the wrong answer, only the members of the opposing team can make the correction. If the correction is accurately made by a member of the opposing team, a score is recorded against the team of the student giving the wrong answer. If, however, the student of the opposing team makes an inaccurate correction, the members of the first team can wipe out the score threatening them by supplying the accurate correction. Prompting can be prevented by considering it as a foul and penalizing with a score the team that prompts.

By this device, each student in a large class may be reached for at least one oral recitation and the teacher may be sure that he is eagerly attentive when he is not reciting. An explanatory word of the teacher in the course of such a game makes a great impression. But the warning must be repeated that, if the game is going to be efficient as a drill, the questions put must cover only one point and must demand only short answers.

What is being done for the Gifted Student of Spanish at the DeWitt Clinton High School

A. *By the entire department:*

1. After-school help classes are conducted entirely and exclusively by the superior students. By guiding and helping their less brilliant classmates they develop their native ability to lead and to initiate.

2. Checking of homework and correction of objective tests are two tasks reserved for the gifted students. Opportunities are thus provided for them to evaluate their own work and that of others.

3. Homework assignments different from those given to the rest of the class are required of the gifted students whenever possible. In the elementary classes, for example, they do the English-Spanish translation exercises ("temas"), the more formal grammar exercises, and all of the vocabulary on an active basis. In the advanced classes they prepare original exercises such as dramatizations, summaries, free compositions, and do more extensive oral reading and less written translation.

4. The following special opportunities for supplementary reading are offered to the gifted students:

(*a*) A departmental library consisting of publisher's sample copies of simple novels, plays, short stories, and historical and cultural readers. Such books are offered to the gifted student not only for home reading, but also for occasional reading during the regular class period.

(*b*) A library of Spanish and Spanish-American magazines and newspapers is maintained as a special room in the school library. Gifted students are frequently excused from drill work to spend the period among the interesting periodicals.

(*c*) A mimeographed list of all books and pamphlets pertaining to Spain or Spanish America contained in the school library is given to every gifted student accompanied by specific personal recommendations.

5. The opportunity for self-expression is afforded the gifted student through frequent dramatizations of the stories read in class, through correspondence with students in Spanish-speaking countries, through editing the departmental Spanish papers (*El Heraldo Escolar* and *Las Noticias*), and through activities in our several clubs (El Círculo Castellano, El Club Menéndez Pidal, The Spanish Marionneteers, The Spanish Glee Club, The Pan American Club).

B. *By the individual teachers* (quoted from their reports):

1. "I have one gifted student this term who, I have discovered, possesses a special hobby for modeling relief maps and then painting them. On four different occasions this term I have exempted him from taking the regular weekly test and permitted him during that time to work on relief-maps of Spain, South America, Central America and Mexico, which he constructed for the classroom bulletin."

—*Regina Freudenheim.*

2. "Superior students of Spanish who are reasonably proficient in drawing are encouraged to illustrate proverbs, prepare charts summarizing grammatical points, or sketch the setting or character described in a story assigned."

—*Patrick Gallagher.*

3. "One of my exceptionally good fourth term students brought in a picture of his conception of El Cid Campeador. This picture formed the basis for a very interesting and profitable class discussion of the history and character of Spain's legendary hero, and led to a pilgrimage of the entire class to the Hispanic Museum where we viewed the original statue in bronze and made comparisons, with our artist as the cicerone and expert."

—*Grace Moskowitz.*

4. "I use my gifted students as my secretaries when I call on Spanish consuls or on foreign trade firms in connection with my work as adviser to the Pan American Student League. They thus get an opportunity to hear Spanish spoken by cultured natives and to use their knowledge of the language and people in a real situation."

—*Joshua Hochstein.*

5. "I hold my bright students up to higher standards. They are the ones whom I require to do the more difficult passages of a translation exercise and to whom I put the thought-provoking types of questions during our conversation practice."

—*William Trulio.*

6. "I encourage my very good students to continued good effort by generous use of public commendation. I never let go by an opportunity to praise exceptional work and point out to the entire class the exceptional merits of the particular achievement. I thus succeed in raising the gifted student in the estimation of his classmates and in arousing a desire to live up to his reputation."

—*Flora Molwitz.*

7. "I encourage my exceptional students to come to me with their problems after school. I do this because I have found that boys frequently hesitate to seek explanations in class that might embarrass their classmates or that might brand them as "highbrows." Furthermore, I find it easier to explain involved idiomatic or grammatical difficulties to these bright individuals than to an entire class."

—*Martin Kennedy.*

8. "The teacher must make the gifted student feel that she trusts him and depends on his assistance. Once he is aroused, his influence in the class has a marked effect on his character. I feel that character development is most important with the gifted pupil. To obtain a lasting effect the boy should be with the same teacher at least one year."

—*Katherine E. O'Brien.*

9. "I have been using my gifted students of Spanish as Big Brothers to help their poorer classmates with their homework at the beginning of the period and at least once a week after school. I also encourage them to visit their classmates at their homes and

Scanned with CamScanner

guide them in their preparation of the homework, teaching them how to study and how to attack work."

—*María de Moscoso.*

10. "I have from time to time invited my best students to accompany me on a Saturday or holiday to a Spanish theatre or talking picture and have not infrequently taken them on jaunts to Spanish restaurants and shops. Through these contacts they are given a wide variety of opportunities for the development of a catholic interest in the subject for which they have demonstrated so marked a predilection and so evident an ability."

—*Joseph L. Slater.*

HYMEN ALPERN.

Chairman, Spanish Department.

DeWitt Clinton High School.

A Journalism Exhibit

During the last few years, the extent to which the newspaper enters into and constitutes a significant part of our daily lives has begun to be recognized in schools. English, economics, and civics classes have made use of newspapers as part of class study. All this, of course, is apart from classes in journalism, definitely devoted to the study of journalism as a phase of civilized expression, and to its use as a medium for the development of skill in writing.

The interest manifested by classes in occasional sidelights on newspaper construction and methods gave the writer the idea of an exhibit of journalistic and allied materials; and with the coöperation of the librarians, such an exhibit has been presented in each of the past three terms, the material being partially changed each time. So general and so genuine has appeared the interest of the student body, and so simple has been the task of preparing the exhibits, that I have felt it worth while to pass along suggestions.

In the first place, each exhibit has been emphatically a (journalism) class project. A small committee of volunteers is appointed; it receives and arranges the material, the rest of the class all being under the general obligation of contributing whenever possible. My part has been to advise and suggest.

Materials have come from various sources. The youngsters come across a surprising amount themselves. Friendly printers will give or lend all sorts of surplus materials. (If there is a school paper, one great source is opened immediately, as will be explained). Visits to newspaper plants may result in interesting finds. Public libraries sometimes have foreign newspapers which are thrown away after a time.

It would require too much space to describe our present exhibit in detail. A prominent part may be called the mechanical aspect, which attracts probably the greatest number. An astonishing number of persons have only the vaguest idea as to how a newspaper comes into being. We therefore arranged in a case materials showing all the steps in the publication of the school paper, from the original copy through the actual type, proofs and dummy to the final product. Likewise, the process of reproducing a photograph and a cartoon is illustrated.

Other materials, on a large bulletin board, include pictures of linotype machines and of presses, samples of various type faces, cards and leaflets showing proofreaders' marks and copy corrected by proofreaders, a booklet showing the plan of a newspaper building, a leaflet showing the processes of picture reproduction by a tabloid newspaper, a map graphically representing the international correspondence system of a great newspaper, diagrams of the system for reporting baseball results to newspapers, and a few newspaper articles about recent mechanical marvels in presses

The problem of overflow materials was solved this term by a member of the committee, who constructed a large book, of heavy paper, bound in cord, and either mounted materials thereon or bound them in. This arrangement made possible the inclusion of a large amount of additional material, including foreign newspapers (members of classes other than the journalism class supplied some of these), newspapers from the other high schools, samples of copy sent over the teletype, a fac-simile of a very old newspaper, a souvenir issued by the *New York Times* showing its front pages reporting presidential inaugurations in the past, and a newspaper matrix, from which the stereotype is made.

MANUEL PRENNER.

James Monroe High School.

The Committee System Adapted To Civics

THE PROBLEM

The turmoil of living and the business of acquiring an independent outlook on life and life problems present themselves as major principles for desiring the development of practical methods of handling civic content and civic classes. Civic content is suggested because the materials at hand are all immediate and have vital qualities—they involve problems of the day. How, then, can one capitalize the mass of materials on hand so as to develop to the fullest the interest of the pupils in current affairs, administrative set-ups and political and social tangents of government?

METHOD OF PROCEDURE

The method to be suggested, "the committee system," is old in theory. It remained only to make cold theory an actual practice. And so the committee system was examined, fortified with new educational approaches and finally introduced as a class method in handling a lesson plan.

THE FORMAL PLAN

The day's assignment is organized into several thought questions. These thought questions, given the day before as homework, involve problem set-ups, developed around both factual and empirical content.

The problems form the basis for committee work. Row one, for example, becomes committee one, row two, committee two, and so forth. Each committee is assigned to determine a cohesive answer to one of the

Scanned with CamScanner

problems. Since no committee knows previously what question will be assigned to it, the homework is done completely. Thus problem three might be suggested to committee one.

Having determined the committees and the delegation of the questions, each group now proceeds to some corner of the room. They bring their note-books along with them, in which are contained their individual answers to all the home-work problems. A chairman is appointed (usually someone to be marked for class recitation) whose job it is to head the group discussion and correlate all the individual answers of the members of his committee into one model answer. His control of the group, both in discipline and in the manner which he obtains member participation in searching for the answer, enter into his functions as chairman.

Committee discussion usually involves about ten minutes of class time. When sufficient time has been granted, the groups are requested to reassemble in their class seats. The chairman of committee one then steps forward and assumes absolute charge of the class.

A statement of the problem, and the answer or solution follows. His discussion is enriched by the amount of criticism he can stimulate in his fellow class-members. The end of his talk is followed by some query such as, "Are there any questions?" The important part of the method follows—the interplay between question and answer. It may be wondered at the amount of questioning a slow class will do, especially now that there is a personal purpose for knowing the work. Criticisms made by themselves appear apparently to fit in with their desire to gain approval or recognition of merit in discussion and debate — not from the teacher, but from their classmates.

If the chairman cannot answer a criticism or question, he then calls for aid from other members of his committee. His job is completed usually within six minutes and the next committee chairman assumes the direction of the class. The last ten minutes of class time is taken over by the teacher for check-up on errors in discussion and thought processes developed by the class.

Philosophy of the Method

The committee system attempts to capitalize upon the natural tendency for group work, as expressed in team play and the common run of general socialized activity. The individual is important for discussion purposes and for the amount of knowledge (in their language—"for the better answer") he can impart to the other members of the group and the student chairman of the committee. The individual thus does not lose his identity to the unit and yet subordinates his suggestions or his answers to the bigger job of getting the best possible response.

The democratic atmosphere is a real elation. Individual participation in discussion receives a natural impulse first, when the committee members search for a model answer (gleaning from their personal answers in the homework note-book) and second when members of other committees criticize and quiz the chairman, obliging him to defend his statements.

The homogeneity, rather the lack of homogeneity, in the group, is, of course, a problem. The slow student, however, gains the advantage of rechecking his understanding of the work, and developing in some degree desirable attitudes in class discussion, in presenting a less frightened picture when called upon to speak. Unsocial tendencies are brought about rapidly, permitting a surer grasp for the alert teacher to recognize their presence and possible reconstruction.

The brighter student goes further along the lines of leadership and individual creative thought. The handling of a committee and apparent responsibility of class direction give greater weight and reason to the necessity for knowing not only class material, but also more than the text contains.

Practically, the method has had an extended influence into other methods of class instruction. The attitude has carried over so that statements, written as board work, or given as ordinary oral recitation, are not accepted entirely without examination.

The committee method attempts merely to put into practice a theory of socialization, developed more carefully as to its divergent possibilities. It has worked in a class having "Civics" content. What the result would be in a history class is as yet a moot question. That is a new problem worthy of further experimentation.

Bushwick High School.

Remedial Work In the Department of Spanish At the Grover Cleveland High School

The old adage "A stitch in time saves nine" holds for the teaching of Spanish as it does for more mechanical activities.

In Grover Cleveland's Spanish Department, at the end of the first marking period, when it has been ascertained who the failing students are, a remedial technique is immediately entered upon which seems to stimulate considerably the work of failing students.

Acting on the universally accepted premise that the school is helpless without the coöperation of the home, the child-centered teacher sends the following letter to the failing student's parent:

> "Your son (daughter) has failed with a grade of .....% for the first third of this term.
>
> "Unless there is a decided improvement in the work this means that he (she) will fail for the term.
>
> "Your son (daughter) does not study at home. Forty minutes per day of home study are required.
>
> "In order to help your son (daughter) to improve, it is necessary that you coöperate with me in getting him (her) to do the Spanish homework. Please state on the enclosed card, each day, how much time has actually been spent on this work."

The above letter is then mailed to the parents by the teacher. Due precaution must be taken, of course, to

Scanned with CamScanner

see that the envelope bears no tell-tale signs as to the identity of the sender, as an official envelope may never reach its proper destination. However, the teacher's responsibility does not end here; sending the letter is merely a beginning. Some parents will seek an interview with the teacher, who will give up a free period and possible part of a lunch period to discuss patiently with the parent the student's weaknesses and a possible remedial program. During this conversation the teacher will have to bring all his resourcefulness into play and tactfully elicit from the parent any information which may prove to be of value in determining the cause of the student's lack of application. Very often the reason is a legitimate one, requiring sympathy, rather than chastisement. Hence the teacher should proceed with patience. Occasions of this sort make teaching what it is—a mission and not just another job.

Later, the teacher will ask to see the student's card each day, without exception, and will make certain that the signature has not been forged.

All this will be supplemented by individual instruction during after-school hours.

The program outlined above is not impossible. It is in actual practice. Teachers with one and two extra-curricular activities are still able to carry out its provisions.

The average high school student of today is not mentally backward; if anything, he is more keenly alive to the life that surrounds him than the student of yesterday. It is for this very reason that he often shuns the seclusion of the study. A little persuasion of a friendly nature and a display of interest in which the teacher shows John Jones that he is interested in him as John Jones, the son of Jim Jones, and that he is not content with merely labeling him No. 1, first seat, first aisle, will greatly improve John's work. Should it not succeed, then let not the teacher feel discouraged, but let him seek and seek until he has found, not a panacea, since we are dealing with individuals, but a method by which to help the particular individual adjust himself to prevailing conditions. This same method may help more individuals; but there may still be a countless multitude who will not respond to the same treatment with equal success. For the latter group a searching analysis will doubtlessly uncover a *modus operandi* as efficacious as the method outlined above. But patience, perserverance, and understanding are prime requisites if success is to be achieved.

EMILIO L. GUERRA.

Grover Cleveland High School.

We Say It With Figures

There are few things that let us [illegible] for a more thorough understanding of language and its meaning than do figures of speech. Figures are the tools not only of poets and orators, but of baseball and slang, of headlines and billboards, and the better we understand figures, the more we see in [illegible] language and expression. Take the subject from "Paradise Lost" to the return of beer, and the language that describes it is largely figurative.

First, consider the dramatists. The language of deep emotion is figurative. Listen to Romeo at first sight of Juliet:

"O, she doth teach the torches to burn bright!
It seems she hangs upon the cheek of night
Like a rich jewel in an Ethiop's ear;
Beauty too rich for use, for earth too dear."

Listen to Portia speaking in hyperbole to Bassanio:

"For you
I would be trebled twenty times myself:
A thousand times more fair, ten thousand times
More rich."

Or to Shylock, master of irony:

"Fair Sir, you spit on me on Wednesday last,
You spurned me such a day,
Another day you called me dog,
And for these courtesies I'll lend you thus much moneys?"

Macbeth in the final agony says:

"My life hath fallen into the sere and yellow leaf."

And Lear, understanding Cordelia at the last:

"He that parts us shall bring a brand from heaven
And fire us hence like foxes."

Less dramatic, more philosophical, are the figures of the poets. The poets write of love, of nature, of spiritual ecstasy, and the language in which they write is highly figurative. Abstract language cannot so rouse the imagination as comparisons, images, personification. Thus Edna St. Vincent Millay, in the poem, "God's World," cries:

"O World, I cannot hold thee close enough!
Thy woods, this autumn day, that ache and sag
* * * * * * *
And all but cry with color!"

Thus Wordsworth in his great Ode:

"The moon doth with delight
Look round her when the heavens are bare;"

and again,

"The Soul that rises with us, our life's Star,
Hath had elsewhere its setting
And cometh from afar."

Tennyson's Ulysses insists:

"I cannot rest from travel: I will drink
Life to the lees;"

He thrusts aside a drab life,

"How dull it is to pause, to make an end,
To rust unburnished, not to shine in use!"

He demands adventure to the end:

"Come, my friends,
'Tis not too late to seek a newer world.
Push off, and sitting well in order, smite
The sounding furrows; for my purpose holds
To sail beyond the sunset, and the baths
Of all the western stars, until I die."

Take the newspapers. Here the topics of the day, the advertisements, the columns of editorials, give us a never ending procession of figures of speech. Notice the following captions: "Death rode Navy J-3 as stowaway"; "The Akron sinks to its watery grave"; "We're bombarding New York with bargains"; and "Hello, everybody! This is Kate Smith, the song bird of the south." Wrigley's chewing gum is "Fresh as a new day," and Old Gold cigarettes have "not a cough in a carload."

Metonymy (under which head synecdoche can well be included) with its substitution of the name of one thing for a related thing, is common in daily usage. Note the following examples:

"A hand at cards."

"The command fell on deaf ears."

"He is proud of his name." (reputation)

Scanned with CamScanner

"The gate receipts."
"He never broke his word."
"Good blood tells."
"On the air." (radio)
"Net men." (tennis)
"A screen actress."
"She is splendid with the needle."
"Next in succession to the crown."
"He never broke his word."

And one which derives all its meaning from the new beer legislation: "Chicago awaits midnight."

The metaphor, with its suggested comparison, meets us on every hand. Here are some recent headlines:

"Foaming floods of 3.2 suds to flow Friday." (also alliteration)

"Messages deluge navy department."

"The sea is combed for survivors."

Expressions in common usage also are often metaphorical: as "cauliflower ears," "the winged word," "unbridled tongue," and "the square deal."

Alliteration is a delightful figure, easy to detect, pleasant on the tongue, and in great demand by poets, advertisers, and headliners. Sometimes it is used for nonsense, as by the immortal Bottom:

> "The raging rocks
> With shivering shocks
> Shall break the locks
> Of prison gates:
> And Phibbus' car
> Shall shine from far
> And make and mar
> The foolish fates."

And sometimes it gives grace and music, as in

"I slip, I slide, I gloom, I glance,"

and

"Nor cast one longing, lingering, look behind."

The advertiser uses alliteration because it is attractive, catchy:

"Buy Bond Bread."

"Storewide Super-Sale."

"We're bombarding New York with bargains."

The headliner seizes it to point his topic:

"Beer, business and the budget."

"Savants turn eyes skyward for Starry Showers to-night."

"Stock sales soar slightly."

"Ed Wynne wins with the women."

Slang, too, is often a figure of speech, as:

"Step on it." (metaphor)

"He got it over to his audience." (metaphor)

"I should worry." (irony)

Now what assignments can be made for figures of speech? Some can come from the classics and some from ordinary usage. Nearly all high school pupils have access to Shakespeare and the Bible. Very well, let them bring in ten figures from one or the other of these sources. The student has a thrill who finds such personification as this from Isaiah:

"And the moon shall be put to the blush, and the sun be made ashamed, for the Lord of hosts will reign on Mount Zion, and in Jerusalem, and before His ancients in glory."

How could irony be more brilliant than in Job's dry remark to his comforters:

"No doubt ye are the people, and wisdom will die with you?"

Shakespeare is of course an inexhaustible mine of figures as fine as this rhetorical question: "Who riseth from a feast with that keen appetite that he sits down?"

On another day figures can be taken from the newspapers. On March 4 of this year, the New York *Herald-Tribune* quoted a pun from the *Tribune* of twenty years before: "Many Republican office holders will think it ought to be spelled March Forth." One pupil finds, "Here's hoping that Mr. Roosevelt's middle name will bring us luck and that prosperity will Delano longer in turning the corner"; another sees a Betty Wales advertisement, "A hat to go to your head."

If a pupil finds these figures for himself, if they spring to him from the printed page, they are his own in a way. They are his find, his thrill, his possession. He experiences new beauty, or new humor, and he is all the wealthier for it.

KATHARINE S. MERRELL.

Far Rockaway High School.

A Departmental Bulletin Board

Our modern foreign language bulletin board lends itself to a variety of uses. The field is wide in the languages, and many of the interests are such as can be illustrated by a display on the bulletin board.

Say it is Wagner week, and pamphlets and folders come to hand containing excellent pictures of the great Richard, of his wife Cosima, of his grandchildren and of views of the cities and opera houses made famous by him. These can be carefully cut out, placed on uniform mounts and attractively arranged on the bulletin board. It is a small tribute, perhaps, but the crowds in front of the bulletin boards evince the interest of the students.

Or suppose it is Pan American Day. Twenty-one republics of the western hemisphere are celebrating, and we in our little corner put on our board an array of the pictured flags and coats-of-arms of all the twenty-one, that of the United States among them no larger than the rest. Or perhaps we have a wall flag-standard and can display the actual small flags, with the maps of North, Central and South America underneath.

Columbus Day, too, can be featured with views of the great discoverer and his romantic vessel, of Balboa, or of

> "Stout Cortez, when with eagle eyes
> He stared at the Pacific."

Foreign countries seem to us so picturesque and the travel pamphlets so well illustrated, that there is no end to the possibilities for display along these lines. A good set of pictures of the French chateaux, postcards of the French cathedrals, the castles on the Rhine, Joan of Arc, the Moorish architecture in Spain, all are interesting. Colored pictures of the Alhambra, that grand old structure set with its red roofs among the trees upon the storied mountain, are full of interest and beauty.

Sometimes the bulletin can be used for topics more closely connected with the classroom. There can be pupils' maps of the foreign countries exhibited. Pictures of foods, drawn by the pupils or cut from magazines, can have the foods labeled with their names in the foreign language—Äpfel, pommes,

Scanned with CamScanner

or manzanas — and they all look gay when thus served up.

At times a display can be made of the attractive covers that students make for their language books. Ordinary paper is used as the basis for these covers, but each pupil decorates it with something appropriate to the text. The design may be a flag, a character or a scene, anything to lend color and interest.

Booklets made by the pupils illustrating the countries are sometimes exhibited. Perhaps a class in Spanish has made books, each pupil taking a Spanish-speaking country and writing it up, with maps and illustrations. For the student it is a pleasant reward to see his handsome book on display, and for underclassmen it is something to look forward to and emulate.

To illustrate literature there are attractive exhibits. There are pictures of authors and musicians, and an array of Don Quijote scenes, reproductions of Carot, Millet, Murillo.

The exhibits to be most effective should follow along in swift succession, say three or four days for each one. They should vary, now an elaborate one, now a single picture. The mountings should be in harmony with their pictures and with each other, and the exhibits arranged in attractive design.

With such a wealth of material as the foreign languages offer there is, indeed, much virtue in the bulletin board.

SOPHIA L. BODLER,
Chairman, Department of Modern Languages.
Far Rockaway High School.

Board of Education Radio Programs Given From October 26, 1932 To May 17, 1933

The following schedule of programs was given over Station WNYC and were organized by Mr. Winfield L. Rice, Acting Director of Civics.

OCTOBER 26, 1932

Speakers	*Topic*	*Music*
Mr. Thomas H. Cowan, Station WNYC	Speaking for Commissioner Albert Goldman	James Monroe High School Band
Dr. Eugene A. Colligan, Associate Superintendent, speaking for Dr. George J. Ryan, President of the Board of Education	"The School Dollar"	Albert A. Becker
Dr. William J. O'Shea, Superintendent of Schools	"The American Red Cross"	
Dr. Harold G. Campbell, Deputy and Associate Superintendent	"Providing Opportunities for Gifted Children"	
Mr. Frank A. Rexford, Director of Education, Museum of the City of New York	"Education in the Schools and in the Museum of the City of New York"	
Mr. Daniel I. Maguire, Deputy Superintendent of School Buildings	"Maintenance"	

NOVEMBER 2, 1932

Speakers	*Topic*	*Music*
Mr. George H. Gartlan, Director of Music	"Music in Education"	Alexander Hamilton High School Orchestra Edward J. A. Zeiner

NOVEMBER 9, 1932

Miss Adelina Kuhn, Head of the French Department, Eastern District High School	"The Teaching of French in our High Schools"	High School of Commerce Orchestra
Miss More, Eastern District High School	First-term class in French	George Bloom
Miss Jeanne Lanz, Eastern District High School	Sixth-term class in French	

NOVEMBER 16, 1932

Mr. George Olano, Consul General of Columbia in New York City	"The Importance of the Study of Spanish in Our Schools and Colleges"	John Adams High School Orchestra
Mr. Chester H. Stratton, Spanish teacher, James Monroe High School	An historical sketch	H. Otto Piatti, Jeannette C. Berner
Mrs. Antoinette L. Hermann, Chairman of the Spanish Department, James Monroe High School	"How Spanish Is Taught in Our High Schools" and A Lesson in Spanish	

NOVEMBER 23, 1932

Mrs. Sylvia Levy, Washington Irving High School	Talk on Germany	New Utrecht High School Orchestra
Miss Dorothy Eltzner, Chairman, German Dept., Washington Irving High School	"How the German Language is Taught"	Philip Ehrlich
Class of girls, Washington Irving High School	Demonstration Lesson in German	

NOVEMBER 30, 1932

Mr. Leonard Covello, Chairman, Italian Dep't, DeWitt Clinton High School	"The Study of Italian"	Samuel J. Tilden High School Orchestra
Miss Mary E. Giacobbe, De Witt Clinton High School	First and third term lessons in Italian	Antonio Miranda

DECEMBER 7, 1932

Miss Maude D. Kivlen, Girls Commercial High School	"Mandatory Legislation"	
Girls of History Dep't, Girls Commercial High School Directed by Miss Norma Lenz	Play—"The Czar and the Princess"	Girls Commerical High School Orchestra and Glee Club Marie Merkert

DECEMBER 14, 1932

Miss Maude D. Kivlin, Girls Commercial High School	"Mandatory Legislation"	New Utrecht High School Band

Scanned with CamScanner

Speakers	Topic	Music
Mr. Murvin Becker, Morris High School	"The United States is a Government by Discussion"—Introduction	Samuel B. Charry
Students from Morris High School	Meeting of the Civic Council	
Mr. William T. Driscoll, Morris High School	Conclusion	
	DECEMBER 21, 1932	
Dr. Charles A. Tonsor, Principal, Grover Cleveland High School	"The Study of Latin"	Grover Cleveland High School Orchestra and Glee Club
Students from Grover Cleveland High School Directed by Miss Grace Light	Lesson in Latin	Paul B. Martin
	JANUARY 1, 1933	
Dr. Eugene A. Colligan, Associate Superintendent	"The Junior High School—the School of the Age"	Prospect Avenue High School Orchestra
Dr. Benjamin Veit, District Superintendent	"The Junior High School in New York City"	Silas Birnbaum
	JANUARY 11, 1933	
Dr. Augustus Ludwig, Principal, John J. Pershing Junior High School	"What Can the Junior High School Do to Guide Your Child in the Selection of Courses and the Preparation of His Work for Senior High School"	Seth Low Junior High School Orchestra May Looney
Mr. Isaac Bildersee, Principal, Seth Low Junior High School	"Training for Citizenship in the Junior High School"	
	JANUARY 18, 1933	
Mr. Frederick B. Graham, Principal, Junior High School 232, Brooklyn	"What the Junior High School Does for Children of Different Abilities"	Henry P. O'Neil Junior High School Orchestra May Dolin Glee Club Margaret Andrews
	JANUARY 25, 1933	
Mr. Albert Loewinthan, Principal, Yorkville Junior High School	"Character Training in the Yorkville Junior High School"	Chorus, Yorkville Junior High School
Miss A. Eugenie Chinnock, Principal, Harriet Beecher Stowe Junior High School	"The Junior High School Industrial Course for Girls"	Thomas Abrahams and Alexander Hamilton High School String Quartette
	FEBRUARY 1, 1933	
Mr. Edward R. Maguire, Principal, Herman Ridder Junior High School	Introductory Address	Orchestra and chorus Herman Ridder Junior High School

Speakers	Topic	Music
Mrs. Sara C. Shubert, Herman Ridder Junior High School	Group Study Plan Lesson in Creative English	William Wucherer Emma Schatteles
Mr. William Wucherer, Herman Ridder Junior High School	A reading group in the German Class	
Mr. Arthur Marr and Mr. Harry Strongman, Herman Ridder Junior High School	A picture of the school court in action	
	FEBRUARY 8, 1933	
Dr. Edward Coyle, Chairman, Latin Department, Morris High School	"Ancient Words in Modern Dress"	Newtown High School Orchestra
Dr. Coyle and a class of boys and girls from Morris High School	Latin Lesson on Cicero's "De Oratore"	C. I. Valentine
	FEBRUARY 15, 1933	
Dr. Helen Louise Cohen, Chairman, English Dep't, Washington Irving High School	"Climbing Parnassus"	Richmond Hill High School Orchestra
Dr. Cohen and a class of Girls from Washington Irving High School	Demonstration lesson	Daniel Wood
	MARCH 1, 1933	
Mr. Forest Grant, Director of Art, Board of Education	Introductory talk on Art	George Washington High School Orchestra
Miss Helen Hutchinson, Head of the Art Dep't, Morris High School	Art Appreciation	Ruth Spaulding
Miss Edna Black, Washington Irving High School	"Art Appreciation"	
	MARCH 8, 1933

Mr. Frances Monte, President, Brooklyn Boys Continuation School Republic	"Student Self-Government"	

The Italian Club At Newtown High School

Since the Italian Club was started at Newtown High School about ten years ago, it has had a varied and uninterrupted career. The Italian Club has engaged in most of the activities which are interesting to language clubs in general, but it has gone beyond the language clubs' usual limit into a social field rich with opportunities and worth-while undertakings. The Italian Club has been a sympathetic bond between the school and the home, offering to many parents of Italian children the delight of visiting the school and sharing in the entertainments, and of marvelling at the talent and charm of our young students.

The Italian Club sets a standard of conduct for the rest of the students

Scanned with CamScanner

in Italian classes. The only requirements for joining the club are as follows:

1. A student must be studying Italian
2. A student who is interested in Italian subjects may be permitted to join.

In days when classrooms were available after school, the Italian Club held regular coaching classes where members of the club helped other members to smooth out their difficulties in other subjects as well as Italian. These periods were always supervised in a friendly way by the faculty adviser who kept her sympathetic eye upon the young people and guided them when the occasion demanded guidance. This "clearing house" of student knowledge and student ideas created a spirit of good fellowship and sportsmanship which the members of the club enjoyed with a friendly, delighted attitude.

At that time we had also developed an attendance committee that investigated and reported on cases of excessive absence. Many of the members were neighbors of these more careless students and the committee called at the absentees' homes to explain to the parents, in Italian if necessary, the importance of seeing that their children were present at school every day of the school year.

The Italian Club has tried at all times to adapt itself to the needs of the students. The Club once undertook to give its members instruction in social dancing. Those whose dancing was good were chosen to teach those who had "never danced" in their lives. With the aid of an old phonograph and a few records, the aim was happily and successfully attained.

There are periods when the members seem bent on parties and socials. At other times their interest is manifested mainly in studying "great men" or music or literature. In the music field some of our members are talented and skillful musicians. Three years ago one of our members set to music a poem which she had studied in the Italian class. Needless to say, the presentation of the original song, sung by another member at one of our parents' entertainments, was received with delight and surprise.

The Italian Club has issued two prizes every term to the best students in Italian Two Years and Three Years of the Regents' examinations. This speaks well for young people who are serious enough to want to spend their small club savings to reward excellence and hard work. The Club has also purchased, from time to time, books which were placed in the school library so that all might enjoy them.

Back of all Italian Club activities there are two old but well tried principles. The Italian Club aims to give the young people an understanding of the background and civilization of their foreign-born parents in order that, as new citizens, they may be conscious of a definite, noble heritage which their parents can hand down to them. This inculcates a pride and respect for their parents which makes for a happy, intelligent adolescence. Next to this is the importance of making it possible for our young students to express themselves in different types of work in which they are talented and to enjoy the company and society of young people of their own age and their own interests.

All our programs, literary and musical, all our trips to the museum, to the Casa Italiana, to Italian entertainments and Club parties are merely subsidiary to the two main principles which I have just set down. So far, our efforts have been crowned with success and happiness, which gives us the courage to continue, even in the face of many difficulties.

CATHERINE R. SANTELLI,
Faculty Adviser of the Italian Club.
Newtown High School.

Homogeneous Grouping In Bookkeeping

At the end of a fiscal period, when results of the year's operations are evidenced by analyses and statements, the cautious business man tries to discover the weak spots in his business in order that the next year's operations may prove more profitable. Losses due to causes over which he has no control he can guard against only by setting up reserves; losses due to management he can usually overcome by more careful manipulation or change of policy.

How about the teacher? At the end of the term there are the final marks which take the place of the statements. But are these studied with a view towards improvement of operations? Hardly. Marks are entered, hands wiped, and let's go!

The leaks or losses in the teachers' statements are the failures. How many of these failures are due to actual inability on the pupils' part to assimilate? How many failures might have been avoided by a better understanding, on the part of the teacher, of the individual pupil? How many by a change of method, by a change of pace, by an occasional laugh, by a more pleasant relationship between teacher and pupil?

Searching for an answer to some of these questions, an investigation and experiment was undertaken last year with two classes in first year bookkeeping.

In the June, 1932, number of HIGH POINTS (pages 69 to 72) there appeared the findings of the early part of this investigation which are now presented in summary form. The "Otis Self-Administering Tests of Mental Ability" Higher Examination, Form A, and the "Orleans Arithmetic Reasoning Tests," Form I were given to these two classes. The intelligence test showed a spread from 81 to 120 distributed as follows:

I. Q.	*Number*
111-120	5
90-110	53
80-89	11

The Arithmetic Reasoning test disclosed a surprisingly large range, as follows:

Arithmetic level	*Number*
9A-9B	11
8A-8B	16
7A-7B	25
6A-6B	17

Scanned with CamScanner

The coefficient of correlation is relatively high between these scores, being .68±.04.

As was indicated in the article referred to, the achievements during the first term accounting bore a close relationship to the achievements on these standard tests; there was only one failure in the group falling above the 99 I. Q. and 8A arithmetic levels, while there were five failures in the group falling below these levels, with no "A" pupils and only four "B" pupils in the latter group.

During the first term, the classes being composed heterogeneously, the work was carried along at a tempo set by the city syllabus with the usual consequences — the more advanced pupils were not challenged to their capacities and the backward pupils were overtaxed. To prevent the slow pupils from falling too far behind, afternoon sessions were held twice a week, on a voluntary basis; those interested enough to want to pass the term's work attended regularly. This arrangement, however, took no account of the brighter pupils; they could not benefit from these extra periods of work as the work covered had already been taken up in class.

The result of the first term's study indicated that the work of the second term, with the ascertained information about these pupils available, might be carried on more successfully if the classes were made up of more or less homogeneous groups. With the kind permission and coöperation of the department chairman and the administrative assistant, these two classes were advanced according to their intelligence quotients and arithmetic reasoning abilities as determined by the above mentioned tests; one class consisted of the thirty-three pupils whose average I. Q. was 103 and the other class consisted of thirty-two with an average I. Q. of 94.

The slower class was scheduled for the second period of the day and the better class for the sixth period, the one immediately following the lunch period. The youngsters were not told that the classes were advanced on any particular basis, although they soon discovered, by comparing notes with each other, that there was a difference in the pace at which they were working. The teacher assigned to these classes was the same as the one who had the two classes the first term.

Soon after the term started it became evident that the morning class would need no after-school coaching. There were only three or four who could not maintain the slower pace and they received some individual attention during the regular periods. The class, as a whole, was able to keep up with the work which was carried on at the city syllabus pace. Just a minimum of home-work was assigned to this group; usually a short piece of work to fix a new point developed in class during the regular period. Some part of each period was devoted to written work, ordinarily it was work on a short set which carried over for several days. The teacher observed the work closely, circulating in the class continually; when an error was discovered (and there were plenty of them) not only was it pointed out at once, but very often a little questioning brought to light the cause of the error, which was misunderstanding of principle, confusion as to meaning of terms, and the like. As all members of the class were about on a par, there was no reason to go on with advanced work before the current topic was thoroughly mastered, or nearly so. It must be pointed out that the work covered did not include anything but essentials. There were no enrichments of any kind. The presentation of the subject matter was simplified to such an extent that all could grasp the work. The teacher, having had the pupils the preceding term, knew the individual weaknesses and was able to anticipate difficulties.

In the meantime the afternoon class, although by no means brilliant, as its average I. Q. of 103 shows, was making rapid progress. This group had time to work out most of the exercises in class and worked the sets at home. Very little individual attention was required and much more ground could be covered in both new work and review work. The entire term's work was completed in sixteen weeks and after a few days of reviewing, third term work was undertaken. The class managed to complete three weeks' advanced work before the end of the term.

At the end of the term both classes were given the Diagnostic Test in Bookkeeping III, as devised by the Board of Education, with the following results:

TABLE I

Distribution of Diagnostic Test in Bookkeeping III Results

	Slow Class	*Rapid Class*
85-100	6	12
75-84	6	10
65-74	10	7
55-64	5	2
45-54	5	2
Average	66.8%	78.3%

As these tests were of a searching nature, covering in detail the first year's work, the results indicate quite clearly what an advantage there is in homogeneous groupings. That more than a third of the slow class was able to score better than 75 is due in no small part to the individual work done with these pupils and intensive drill work; it indicates also that intelligence tests are no definite criteria of capacity.

The following figures show the final results for the term's work with both classes:

TABLE II

Distribution of Final Marks For Accounting II

	Slow Class	*Rapid Class*
90-100	0	6
80-89	3	8
70-79	15	12
65-69	11	6
Failures	3	1
Average Mark	69%	76%
Percentage Passed	91%	76%

Sixty-one out of sixty-five pupils in both classes passed the second term's work, or 94% passed as compared with 80% passing for the rest of the

Scanned with CamScanner

second term bookkeeping pupils in this school.

As a result of this investigation the following conclusions may be drawn:

1. Bright pupils have more opportunity to complete the term's work and take advanced work if they are not hindered by slow pupils in the class.
2. Slow pupils have a better chance to master their work if they are taken along at a pace suited to their capacity.
3. Homogeneous grouping tends to make both teaching and learning more economical as there is less effort expended on the part of both teacher and pupil when the spread in ability is narrowed down to a minimum.
4. As a result of prognostic tests (intelligence and arithmetic) to all entering high school commercial students, those whose results place them in the lowest sixth should be excluded from bookkeeping classes, but should be given some allied though less exacting subject.
5. If classes in bookkeeping were homogeneously grouped, the bright groups should be able to complete the four-term course in three terms.
6. Wherever possible, teachers should be permitted to advance their classes from the first term to the second term of a subject which carries over. The advantages in this are obvious.

ADOLPH KLEIN.

Haaren High School.

The Italian Mid-Term Examination As An Achievement Test

After marking the mid-term examinations and returning them to the pupils, I had each one make a table showing the record of his achievement. These tables were useful because they showed which part of the term's work would have to be reviewed and drilled again for the whole class in general. They were also of definite use to the student for they showed immediately what his weakness was and where he needed help. I have kept these tables for reference and by constantly consulting them I hope to be able to bring some of the failures up to grade and to help others to obtain an honor grade.

Two of these tables, from two of my classes, read as follows:

Daniel D. Italian I

	Points Assigned	Points Earned
1. Translation into English	15	14
2. Comprehension	15	10
3. Classroom expressions	5	2
4. Plural of nouns	5	0
5. Definite article	5	4
6. Indefinite article	5	0
7. Present tense	12	0
8. Memory	8	1
9. Verb series	10	1
10. Verb forms	20	11
	100	43

Daniel needs to be taught again the formation of the plural, the definite article and the meaning of tense. He probably has not applied himself sufficiently to learn his poems and proverbs. He could easily see his weak points from the above table which he made of his own paper and he has promised to try hard if I give him a little individual help.

John S. Italian 2

	Points Assigned	Points Earned
1. Dictation	10	6½
2. Silent reading	5	5
3. Translation into English	10	10
4. Translation into Italian	10	6
5. Agreement of adjectives	10	10
6. Idioms	10	8
7. Future tense	10	2
8. Contractions of prepositions and articles	5	2
9. Past participles	5	2
10. Numbers	5	5
11. Comprehension	10	7
12. Fact Questions—Completion	10	8
	100	71

John wishes to raise his mark. He is going to college and must have an average of 75% or over. I have promised to give John more dictation and to review with him those grammatical points which do not seem clear to him. He has made a copy of his table and is keeping it for his own reference. The results should be interesting, and the mid-term examination has become a vital, useful test for him instead of something to be taken merely for "points."

CATHERINE R. SANTELLI.

Newtown High School.

EDUCATIONAL NOTES AND ANNOUNCEMENTS

National Survey of Secondary Education

THE most comprehensive and illuminating study of American secondary education ever made is now in process of publication," Dr. William John Cooper, United States Commissioner of Education, declares in announcing a forthcoming series of 28 monographs of the National Survey of Secondary Education. Doctor Cooper directed the Survey.

Retrenchment in public school expenditures through changes in courses of study and similar modifications to meet the present economic emergency should be based upon these reports, points out Dr. Leonard V. Koos, professor of secondary education in the University of Chicago and Associate Director of the Survey, in announcing results of the three-year investigation.

"The investigators were primarily concerned with a study of the unusual practices of schools rather than their ordinary features," according to Carl A. Jessen, specialist in secondary education in the Federal Office of Education, and coördinator of the survey.

Scanned with CamScanner

The Survey concentrated on five major fields: (1) The organization of secondary schools: (2) student personnel problems; (3) administrative and supervisory problems: (4) curriculum activities; and (5) extra-curricular activities.

Individual Differences

From a study of provisions for individual differences in 8,594 selected schools, the Survey findings on this phase of the inquiry disclose that comparatively few schools are making thorough provisions for individual differences. The investigation reveals that the problem of providing for individual differences grows more acute as the proportions of our population registering in our high schools increases.

In the study of individual differences in the selected schools, 28 provisions were noted. Provisions for individual differences are, in general, innovations. The five most frequently reported were: (1) Provision for variation in the number of subjects a pupil may carry; (2) special coaching of slow pupils; (3) use of the problem method; (4) differentiated assignments; and (5) advisory program for pupil guidance.

The report reduced the 28 provisions for individual differences to seven categories: Homogeneous grouping; special classes; plans characterized by the unit assignment; scientific study of problem cases; variation in pupil load; out-of-school projects and studies; and finally, advisory or guidance studies. The three provisions first mentioned are clearly considered the most important, and the major portion of the report is given to their discussion.

Guidance

A special phase of the Survey deals with guidance. The investigators state unequivocally that the character of modern education demands guidance. Changes in the social and economic order requiring adjustment make more significant the need of bringing counsel and guidance to boys and girls. Furthermore, the introduction of guidance is regarded necessary to prevent waste in the process of education.

The examination of various guidance programs revealed four outstanding types: (1) Centralized bureaus of guidance for secondary schools in city systems, represented in the study by Boston, Chicago, and Cincinnati; (2) city school systems with a central guidance organization but with the individual secondary school considered the unit in the program, represented by Providence and Milwaukee; (3) centralized bureaus or departments in individual secondary schools, represented by the Milwaukee Vocational School and the Township High School and Junior College, LaSalle, Illinois; (4) central guidance organizations in individual secondary schools which utilize regular officers and teachers as guidance functionaries, represented by the Joliet Township High School and Junior College, the Thornton Township High School, and the New Trier Township High School, all located in Illinois.

report gives case studies of guidance service in the 10 schools and systems just mentioned.

Subjects

The Survey reveals that the number of subjects offered in senior high schools and four-year high schools have consistently increased. The number offered in junior high schools has definitely decreased during the past decade. The percentage of pupils taking foreign languages and mathematics has decreased while the percentage of those taking commerce, physical education, and social studies has increased.

A study of the subjects presented for graduation from typical high schools between 1890 and 1930 discloses remarkable contrasts. In a certain Eastern high school more than 95 per cent of the subjects studied in 1890 were in the fields of foreign languages and mathematics. The percentage dropped to 58 in 1930. In a certain high school of the Middle West the parallel percentages were 55 and 53.

Libraries

Replies to inquiry forms were received from 390 schools reported to have outstanding library services; 44 schools were visited and the library facilities studied in great detail. It was found that more than five-sixths of the schools studied have the library housed in rooms used only for that purpose. Less than one-tenth of the schools have the library in the study hall. Librarians prefer to have the library housed separately; principals prefer to have the library housed in study halls or in rooms directly connected with study halls by doors or passageways. Pupils, the investigation reveals, use the library more often in those schools where it is readily accessible than in schools where it is housed separately.

Health and Physical Education

Physical education is required in almost all of 460 outstanding schools studied. In about a third of the schools either full-time or part-time directors of health are employed. Health examinations are common, but in many schools the follow-up work is not yet adequate. The schools reported 25 different kinds of health service which they render, chief of which are free immunization for pupils and free milk for malnourished pupils.

Athletics

From the study of athletics, the Survey found that "plainly the trend is not toward abandonment of interscholastic athletic activities, but rather toward readjustments in aims and emphasis." There is a pronounced tendency to coördinate physical education, health, and intramural athletics; to a lesser extent this tendency applies to interscholastic athletics.

Laws

The study of the legal and regulatory provisions affecting secondary education disclosed that there is need for their codification and simplifica-

Scanned with CamScanner

tion. As these laws now exist they represent a series of amendments, changes, and supplements in the form of piecemeal legislation over a period of many years. Legal tendencies are toward greater State control over secondary schools. While the legislature of each State has regarded secondary education a State function, the major responsibility for the support of education rests upon local school districts. More practical legislation is needed for the creation of larger local districts or units to control and support secondary schools. The present legislative schemes for larger districts through the reorganization of two or more districts have not been adequate to the needs of secondary schools.

This study, in addition, reveals that State requirements for attendance at secondary schools are moderately low in a majority of the States. Recent legislation, it is explained, tends to favor increased means for attendance at high schools already established rather than the establishment of more high schools.

Types of Organization

Study of the various types of organization points to four characteristics especially likely to contribute to comprehensiveness and consistency in secondary school organization. In order of their importance these characteristics are: (1) large enrollment, (2) the adoption of a form of grade combination which will free the school from a purely traditional mould, (3) close association of junior and senior units, and (4) the adop
tion of internal arrangements which
will insure treatment of the junio
and senior units as coördinate part
of the school. It was found by appli
cation of a scoring technique devel
oped by the Survey staff that average
scores of 3-3 junior-senior high schools
were higher than those of three-year
separate schools of equivalent enroll
ments in the junior and senior units
Junior-senior schools of more than
500 pupils as a class are better or
ganized than separate schools of the
same total enrollment. Undivided six-
year schools enrolling fewer than ap
proximately 250 pupils tend to be
less well organized than junior-senior
schools of equivalent size.

Two and four-year reorganized
schools are characterized by a high
degree of variability in their organi
zations. It was also found that even
outstanding elementary schools and
four-year high schools show marked
signs of being restricted in their or
ganization by certain conventional
standards and procedures. Through
out the study it was apparent that
individual schools within the different
groups showed great variability in
comprehensiveness and consistency of
their organizations.

In making comparisons among re
organized schools of various types it
was found necessary to compare
schools of approximately equivalent
sizes. It was found that the junior-
senior schools as a class scored higher
on both comprehensiveness and con
sistency of organization than did the
segregated junior and senior schools

The Same Small High School

Through the development of pupil transportation among the smaller secondary schools at public expense, significant progress has been made in bringing improved secondary-school opportunities to rural children. On the other hand, serious administrative and teaching problems appear in the smaller schools. One problem is the shortness of tenure and another the heavy teaching load in terms of the number of different subjects taught. It was found further that a considerable percentage of both principals and teachers receive unreasonably low salaries. Other findings reveal that the smaller secondary schools as a class are lacking in adequate space for athletic games and sports ordinarily carried on in high school, and that these schools are inadequately provided with special rooms for other than instructional purposes.

Negroes

In the study of secondary education for Negroes the investigation reveals the superiority of the large high school over the small one and of the reorganized school over the regular one in educational advantages. Of every thousand Negroes in our population, only 11 are enrolled in public high schools; while of every thousand white persons, 34 are registered in public high schools. There are approximately 159,000 Negroes of high-school age residing in 230 counties which offer no high-school facilities for Negroes.

Administrators

The phase of the Survey touching upon administration and supervision discloses that of the total number of staff members in State Departments of Education, 916, or about 32 per cent, are concerned chiefly with secondary education. Nearly half of them have masters' degrees and an additional 6 per cent hold doctors' degrees. Almost 80 per cent of the staff members report at least five years of college work. Their educational experience varies, but the median length of education service is 13 years. City superintendents and assistant superintendents hold advanced degrees more frequently than do other staff members. Superintendents and principals in the East appear to be least well prepared in terms of academic degrees earned. Education is reported as a major study most frequently in the Western States and least frequently in the East. Forty-four per cent of the superintendents and principals have earned bachelors' degrees only and have not obtained advanced degrees.

Their duties and functions differ greatly. After examining the responsibilities of superintendents for secondary education, members of the Survey staff state that there is need for a careful definition of the duties and functions of administrative and supervisory officers.

Selection of Teachers

Surveying selection and appointment of teachers, the specialists report

Scanned with CamScanner

that about 2 per cent of the Boards of Education or their committees appoint teachers without official participation by the superintendent. In 45 per cent of the cities the superintendent nominates or recommends, in 25 per cent he appoints, and in about 28 per cent there is a combinational method.

FINAL REPORT

The following nine monographs have already been published: "Instruction in English," "Instruction in Mathematics," "Instruction in Music and Art," "Instruction in Science," "Secondary-School Library," "Articulation of High School and College," "Health Work and Physical Education," "Research in Secondary Schools," and "Intramural and Interscholastic Athletics."

The complete list of 28 monographs reporting the National Survey of Secondary Education findings available from the Government Printing Office in Washington may be had on application to that office.

—*Release of the U. S. Office of Education.*

Requisites of Genuine Scholarship

Sir James Jeans, in his book "The Mysterious Universe," says that the final truth about a phenomenon resides in a mathematical description of it. Then he goes on to say that a mathematical formula can never tell us what a thing is, but only how it behaves; it can only specify an object through its properties. Therefore, I shall try to define genuine scholarship by describing its characteristics.

Scholarship is present when the individual possesses

(1) An unquenchable thirst for knowledge;

(2) An intelligent plan of action guided by a well-conceived purpose and controlled by a scientific technique;

(3) A permanent and continuous interest in a certain field of human endeavor;

(4) The habit of patient, painstaking, accurate work;

(5) The ability to synthesize the accumulated knowledge into generalizations which will stand the test of common sense and scientific verification;

(6) A knowledge of the other fields of human thought and a sympathetic interest in their strivings and achievements, coupled with a willingness to help the workers in other fields and be helped by them.

These characteristics of genuine scholarship are common to all students be they research scholars, teachers or pupils. As Dr. Livingston Farrand, President of Cornell University, has said, "To inquire with zest, to weigh with care, to judge with soundness and to act with vigor are the capacities which the world demands and the encouragement of which is the aim of education."

If my description of genuine scholarship be correct, we can next inquire under what conditions such scholarship can best be developed and flourish. Following are some of these requisites as they apply to any institution of learning:

(1) A quiet school where the tempo, though resolute, is nevertheless leisurely like the movement of a strong, deep stream. It may surprise and enlighten some of us to look up the origin of the word school. It is derived from the Greek work *schole*, meaning leisure.

(2) Teachers who are truly scholars. A teacher who possesses the attributes of scholarship as outlined above is bound to be a good teacher; his students are imbued with his zeal, his urbanity, his technique. His influence is like the gentle throwing of a pebble into a pond. It starts a series of shimmering ripples ever widening until they leave the dark, resistant, dull clay on the shore and transform it into life-giving foliage reaching up to heaven.

(3) An administration that serves and is subordinated to the ends of scholarship. Such an administration must not foist upon the teachers and students tawdry trivialities, tinsel tomfoolery, pedagogical mountebankery, Brummagem statistical legerdemain. "School administration does not exist for itself; it is only a means, not an end. Schools are maintained only for the giving of education, . . . School administration, therefore, exists only for the pupil, and its efficacy must be measured by the extent to which it contributes to teaching and learning; to teaching and learning it must always be a servant. It makes its largest contributions by providing efficient teachers and by furnishing them and their pupils with the proper tools and environment with which to work." (Reader: "The Fundamentals of Public School Administration," page 4.)

(4) Scholarship flourishes best where thought is untrammeled, where progressive methods prevail, where experiments generated by the students and teachers are given free rein and where the fullest measure of self-government is permitted. Individual initiative and individualized methods vitalize it; standardization and the crass methods of factory mass production destroy it. Centralization asphyxiates it, individualization makes it blossom like the rose. Let me end this paper by quoting a great teacher, St. Paul:

"Who also hath made us able ministers to the new testament; not of the letter but of the spirit, for the letter killeth but the spirit giveth life." II Corinthians, 3:6.

Chairman of Department of
Economics and Civics.
Abraham Lincoln High School.

Developing Personality

How can we teachers in the classroom develop the personality of our

Scanned with CamScanner

pupils through the formation of good habits, the stimulation of interests, the cultivation of tastes and the development of a sense of responsibility?

Watson concludes his "Psychology from the Standpoint of a Behaviorist" with this definition of personality: "Our personality is the result of what we start with and what we live through. It is the reaction mass as a whole. The largest component of the mass, if we are normal, consists of clean-cut definite habit systems, instincts that have yielded to social control and emotions which have been tempered and modified by the hard knocks received in the school of reality." Menninger says of a personality: "First, it is possessed of an inherited nucleus of physical and psychological potentialities. Just how much or how little this hereditary part is no one really knows; all we know is that it is less than we used to think. It is usually confined to physical structure, including brain patterns. Functional propensities are usually acquired rather than inherited." He goes on to say that whatever nucleus is inherited is soon acted upon by a great variety of powerful influences, training, teaching, examples of parents, reactions to brothers and sisters, climate, weather, architecture of home, food, fashions, school, church, newspapers, playmates, society in general, economic and social laws, accidents of life, illnesses, griefs, and so on. How much influence in the development of these can we as teachers exercise on the child with whom we have so little time contact?

Which habits contribute to definite personality? Here are a few that to me are desirable. When the child enters our classes, we tell him that we insist upon a certain definite routine in order to save the time and energy of the individuals. We insist upon regularity and punctuality, not because we are autocrats in the classroom, but because failure to be regular in punctuality and attendance means a loss to the pupil who is absent and tardy. The delinquent not only interrupts the work with his late arrival, but also retards our progress because we must wait for him to catch up. These habits of regularity and punctuality should be extended to his homework because failure to do each day's work daily reacts unfavorably on him when he finds himself with too much to make up at the end of the term. We insist on clean boards, floors, desks and written work because disorder confuses the mind. Our work is retarded by the confused mind. After these simple habits are formed, we advance to more complicated ones. We must help the child form the habit of organization. He must organize his time so that he can fit in all his work for the day. He must allot his time so that one subject does not suffer at the expense of another. He must then be aided to form the power of concentration. He should focus his attention on the subject at hand to the exclusion of everything else so that he may get the most in as short a time as possible. It may take him a long time to form the habit of concentration, but with perseverance he will acquire it.

This persevering is another necessary habit. Everything and anything can be accomplished if we know how to stick to the job. The habit of selection must be acquired. We may help him cultivate this habit, first, by making him pick the important thought from every sentence, then the important topic in every paragraph. From this he learns to select and arrange facts that formulate his theories on life. He learns to select his friends more intelligently. This selection keeps him from hasty judgments, which, incidently, leads to another habit, that of suspending judgment. But the child must be made to understand that no judgment is fair unless he forms the habits of understanding, tolerating, and sympathizing with the people upon whom judgment is to be passed. These habits will tend to make his personality more expansive.

Teachers, as a trained and cultured group, should develop personality by stimulating interests. In the first place, subject matter should be presented by people who are vitally interested in the subject. Children who enter a class with a determination to loathe a subject very often are converted to a love for that subject because of the interest exhibited by the teacher. The teacher should encourage the child to ask questions and to express himself freely. From this expression the teacher will get a clue to the child's interests. These interests of the child can be related to the subject matter which, though it is an old interest, may actually serve as a new one.

In our rooms important characters are discussed. We learn that the children admire men like Washington, Jefferson, Roosevelt, Lindbergh, Edison, Wright. They despise men like Benedict Arnold, Aaron Burr, Al Capone. They love the qualities of the first group. These qualities—fairness, open-mindedness, courage, strength, power—traits that make the inventor and the pioneer, all are constructive and tend to build up the world. The qualities of the second group—treason, cheating, lying, killing, law breaking — are destructive. Through proper direction, pupils may become interested in trying to become builders and not destroyers. These are new interests. Ask them questions of the day: "Why would you vote for Roosevelt if you had the vote? Why do you believe in Tammany Hall?" One child told me that she became so much interested in the political platforms that she read for hours forgetting that she was doing it for history homework. Show them that there are different points of view on the same subject. Send them out to bring you the authors of different lines of thought and you will find them coming back with books and points of view new to you. Listen to their words of wisdom and have regard for them. Take them seriously if they are not bluffing. Don't make decisions for them. Let them come armed with facts to support all sides. Let them draw their own conclusions. If you respect them, they will try to be worthy of your respect and go in for more knowledge. They will have acquired new interests which will make

Scanned with CamScanner

their personalities more capable of meeting the problems of the outside world.

How can we teachers develop personality by cultivating tastes? Most of our children come from homes, good and substantial, but not particularly cultured and advanced in taste. We must raise their standards in manners, speech, dress. We must help develop their taste for good literature, art, and plays. We must show them that lips discolored by too much rouge, scarlet nails, and low cut evening dresses for school are not the tastes of refined people. I have found that children respond constructively to a casual mention of the vulgarity of extremes. It is not wrong to rouge in moderation. Nor it is wrong to have well-kept nails. But in refined circles it is considered good form to be inconspicuous in makeup and dress. Emphasize the personality. They will note that refined people do not go to flashy extremes and in time they will imitate them. Of course we must not be disheartened because we cannot influence all our pupils, for we must remember that the sum total of all the other influences of their environment outweighs ours. However, we must stretch every effort to cultivate good tastes. We find that the various high school departments do their share. The English Department makes many readers turn from trash to cultural literature. The Art and Music Departments stimulate a better appreciation in painting and music. But I don't think sufficient time is given the latter departments. I cannot understand why schools do not run the good old-fash- ioned Spring and Christmas concert that Mr. Tracy gave every year at the Morris High School. I know that as students we were inspired by these entertainments which were regarded as the gala events of the year. In our tawdry atmosphere of the Coney Island Boardwalk, we have more to fight against than most schools. Schools should not sink to the depth of outside taste. On the contrary, they should serve as the stimulus that will raise the standards of the pupils. We should make more fuss over that small group of children who are keen in the appreciation of art, music, and literature. They will then be noticed and perhaps act as a stimulus to the others. From these stimuli may come imitation, which may result in the formation of good taste.

The most important step in the development of personality is to emphasize for the child the fact that he is a very important individual, a very important member of society. Just now his father is supporting him and his mother is making the home comfortable for him so that he may do his part of going to school successfully. That is his only responsibility now, and it must be well done so that he may prepare himself for his part in the affairs of the world. Everything in the next generation depends upon him and his fellow schoolmates. They are the next voters, the next officers, mechanics, tradesmen and professional men. Therefore, the school must be a reflection of the responsibility it must assume. If the school is known for its good scholarship, its fine behavior, its system of self-government, its preservation of school property, then the young people attending the school are being trained for responsibility as citizens.

REVIEWS

A Charter For the Social Sciences In the Schools

Report of the Commission on the Social Studies of the American Historical Association, Part I. Drafted by Charles A. Beard. Charles Scribner's Sons, 1932; 122 pages.

At last an attempt is being made to bring order into the chaos into which the teaching of the social studies seems to have fallen. As a culmination of several years of study, the Council of the American Historical Association appointed in 1928 a Commission of sixteen members to investigate the status of the social sciences in elementary and secondary schools throughout the nation. The Commission appointed a sub-committee to consider objectives. This "Charter" was drawn up by the sub-committee. The fact that such men as George S. Counts, Harold O. Rugg, and Charles A. Beard were involved in its preparation is sufficient indication that this book merits serious attention.

The "Charter" is an introductory volume to a series of at least twelve volumes which the Commission plans to publish by 1933. The "Charter", then, is a preamble, a declaration of faith, a statement of fundamental assumptions upon which all the subsequent reports will base their work. To Charles A. Beard was given the task of coördinating the findings of the Committee on objectives and the result is the "Charter for the Social Sciences in the Schools."

It is difficult to over-estimate the importance of this little book. It aims to do for our generation what the Committee of Seven of the American Historical Association did for the previous one, namely, to present a guiding set of principles that can serve as a common standard for administrators and teachers throughout the country. To escape from the outworn platitudes that preface every course of study, to redirect the energies of our schools, to give inspiration and purpose to the teachers of the social studies—this is the goal.

Does anyone question the need for light on the part of teachers of history, economics, and civics? It can safely be said that the post-war period has brought unprecedented confusion into these fields. Everywhere controversy is become more acute, certainty and complacency are giving place to doubt, old standards and institutions are being criticized and questioned. At a time when the creative energies of the world are feverishly seeking for a way out of its political and economic tangles, pity the teacher who is anx-

Scanned with CamScanner

ious to help but knows not what road to take!

The "Charter" attempts to point out the road that the teacher who wishes to join in the effort to make the desirable elements of our civilization more secure must take. At the outset, Professor Beard (we shall, for convenience, refer to him as the author) recognizes that there are three masters that the teacher of the social sciences must serve. They are (1) historical scholarships, (2) the realities of society, and (3) the requirements of the teaching and learning process. To neglect or minimize the importance of any one of these means that there will be certain failure. Can, however, the teacher serve all three faithfully? Suppose the community, which is our employer, asks us to sacrifice the truth as revealed to us by scholars? Professor Beard gives a concrete example of such a conflict of loyalties: "In some communities supposed to be enlightened, teachers are forbidden to discuss Russia without denouncing her form of government and system of economy."

To begin with, the "Charter" lays down the principle that the disinterested pursuit of truth, without reference "to the possible applications of his findings to practical affairs" should be an ever-present object of the teacher's allegiance.

But, to be successful, the teacher must effect a conciliation between the world of fact, opinion, and tradition of which he and his pupils are a part, and the data and conclusions of pure scholarship. Professor Beard states the case admirably when he says, "We do not live by the written word alone, nor derive from it all guidance in theory and conduct." Ideas must adjust themselves to the soil in which they seek to flourish.

What are the social realities that must shape civic instruction? First, we must recognize that the society in which we live and work is constantly changing. Secondly, in contrast with the civilization of the orient or mediaeval times, modern civilization is distinguished by being founded on science and machinery. Thirdly, we are formulating a program of social studies for pupils who some day are to participate in the government of the United States. Fourthly, American society is not isolated but operates on a world stage.

These four "social realities", if considered in their implications, have a vital effect on our teaching objectives. In view of the dynamic character of our society, we must recognize that some of our most cherished institutions; i.e., the family, are altering radically. It is, therefore, no longer desirable to teach dogmatism on such subjects. To quote: "In a fixed regime it is possible to establish duties, rights and responsibilities with a fair degree of definiteness, effective always everywhere; but in a changing society it is not only out of the question, but attempts to effect it are dangerous to orderly development." If adopted this attitude, alone, would revolutionize our system of education.

Our industrial civilization has made it a necessity that we give our pupils a capacity for adaptation. Routine skills and fixed ideas are no longer as useful as they were in an agricultural society. Our objectives must be based on a consideration that "the world into which our children are to be graduated, for which they are to be prepared, will be a world in which rationality, planning, and intelligent coöperation will have increasing sway in domestic affairs, industry, and government." Professor Beard more than hints that "rugged American individualism" is a doctrine to which our schools can give scant encouragement.

If our students are to be fitted for intelligent participation in democracy, they must know the realities of our government. The crucial question is: shall we discuss in class controversial subjects and air the problems that are being discussed in newspapers, forums, and magazines? Professor Beard's answer is unequivocal. We *must* discuss these questions if our instruction in citizenship is not to be limited to sterile abstraction. To quote again: "It would be better to ignore entirely the subject of government in social studies than to confine it to innocuous generalizations on which people agree in theory and disagree violently in practice." A conspiracy of silence in the classroom leaves our children helpless when they leave. The teacher must, of course, treat controversial subjects in an impartial and scientific spirit. It is futile to attempt to reach definite and final conclusions. Rather, the aim should be to instill a "wide knowledge of facts and a discipline in thinking."

The rapidly multiplying ties between the United States and the rest of the world bring new responsibilities to the teacher. The "Charter" holds that our whole tradition, coupled with our obligations under the Kellogg Peace Pact, is in the direction of the renunciation of war as a national policy. The teacher is obliged, then, "to create in the popular mind conditions favorable to the continuous realization of peace." One wonders how some of our patriotic societies will look upon this "obligation" of the teacher.

There are certain ideals that Professor Beard believes ought to be inculcated for the purpose of enabling the student to make conscious choices when the time comes. Some of these desirable ideals are: that poverty can and must be eliminated; that those who exploit society and return no compensation in service are enemies of society; that all are entitled to the fullest possible educational opportunity; that special privileges must be abolished; and that diverse opinions should be respected and tolerated. Under this program, all can find a place who wish to begin the task of reconstructing society in the schools.

Lastly, the teacher must perform the miracle of bringing the fruits of scholarship, social realities, and ideals directly to the student. The consideration of how this is to be done takes us into the field of pedagogy. Here Professor Beard recapitulates the concepts that have for some time been associated with modern teaching. "All

Scanned with CamScanner

instruction . . . must turn on the individual pupil"; we must aim to create "rich, many-sided personalities"; students should be made to realize the importance of the cultivation of independence of judgment. These aims are less novel to us and will probably encounter less opposition than other ideas in the "Charter."

In conclusion, it seems needless to plead for a wide audience for this book; the prestige of the American Historical Association and the personnel of the Commission which is directly responsible for it will undoubtedly attract much attention to it. The uniqueness of the "Charter" lies in the fact that it does not merely aim at giving the accepted or most universally used objectives as previous studies have done, but that it has attempted to set up new standards. Will it prove to be merely the aspirations of a small group of scholars and exceptional teachers, or will it be accepted as the much-needed revitalizing element in the teaching of social studies? The answer lies in the hands of administrators and teachers.

SAMUEL H. HALPERIN.

Manual Training High School.

Citizens' Organizations and the Civic Training of Youth

By Bessie Louise Pierce. Part III: Report of the Commission on the Social Studies, American Historical Association. Scribners, 1933.

That the twenty-five million pupils in the public elementary and secondary schools of the nation should prove a tempting morsel to the hydra of propaganda is self-evident. The average citizen, however, has only vague notions about the extent to which certain groups with special axes to grind try to mold the mind of his child into a particular pattern. It remained for Miss Pierce to point out in this part of the Report of the Commission on Social Studies both the width and the depth of this penetrating propaganda.

Each of the eight component parts of the volume treats of the activities of a group of somewhat similar organization. Part One is devoted to "Educational and Civic Policies of Patriotic Organizations." Among these discussed here are the numerous post-war groups like the American Defense Society, Military Order of the World War, the United States Flag Association. These aim to save our youth from the snares of the radical, strive to teach the adult as well as the youth in the proper use of the flag, hope to equip every American home with it, and have as one of their objects the "arresting of citizenship deterioration of the American youth."

The next section of this part of the volume deals with the societies of the American Revolution. The Sons of the American Revolution, organized in 1889, as well as its numerically superior Daughters of the American Revolution founded the next year, devoted special attention to the content in history text-books. The "Sons" are alarmed at the point of view of Professor Faulkner because he believes that "students of history and international relations are practically unanimous in placing inflated patriotism and arrogant nationalism as among the chief elements in the development of war psychology and among the chief influences working today against the restoration of international good will and economic prosperity." They say that those who agree with him are "Wells, Trotzky, and our own Muzzey" (pp. 26-27). The "Daughters" are quite concerned about the patriotism of teachers and urge their members to "put loyal American men and women on our school boards." They "want no teachers who say there are two sides to every question, including even our system of government; who are more for their academic freedom of speech and opinion (co-called) than for their country." Within the prodigiously short period of five years of the establishment of these organizations, the society of "The Children of the American Revolution" was founded. This body for boys under 21 and girls under 18 devotes its energies to the celebration of the patriotic anniversaries and upon maturity the members join the "Sons" or the "Daughters."

The activities of the American Legion and Veterans of Foreign Wars conclude the first part of this interesting report. The former body, a bit skeptical about the history text-books, undertook to write one of its own which "would preach on every page a vivid love of America." In 1925 appeared its two-volume text, the first of which treats of the colonial period and the second of our history since 1789. The Veterans also condemn many text-books and find Hayes and Moon's "Modern History" as unfit for school use because it contains "subtle falsehoods designed to restore America into sentimental, spiritual and political subjection to Great Britain." All of these organizations get into the life of the schools by fostering essay and oratorical contests, distributing medals, flags and the like.

Part Two describes the propaganda of the military groups and the agitation they carry on for the establishment of military training in schools, the founding of R. O. T. C. units and the organization of Citizen Military Training Camps.

To offset this propaganda the various Peace organizations, like the National Council for the Prevention of War, the League of Nations Association, both of whose activities are narrated in Part Three, carry on an agitation of their own. Here also free literature, essay contests, poster contests and medals are the methods employed, although not so extensively, because speakers of these groups often "find the doors of the public buildings closed to them."

The propaganda of Fraternal Orders like "The Free Masons," the Order of DeMolay (open to Masons' sons between 16 and 21), the K. of C., the Junior Order of American Mechanics, is analyzed in Part Four. Here the story of contests, education days, special parades, demonstrations, requests that no foreign languages be permitted at public meetings, and the like is repeated. For her purpose, Miss Pierce considers the Klu Klux Klan as a fraternal order and describes its activities

Scanned with CamScanner

here.

The next part is set aside for the activities of racial and religious groups. To supplement the inadequate treatment in school texts of the rôle played by people of certain racial origins or religious affiliations, these groups publish literature often for free distribution in public and private schools.

The next fifty pages, comprising Part Six, are set aside for the portrayal of the youth movements in this country. Here space is found for the activities of the most obvious organizations like the Boy Scouts as well as those of the obscure Young Communist League. Throughout, the information is well documented and appropriately illustrated.

It is to be expected that the activities of the "vested interests" would find adequate representation in a study of this kind. The author has very appropriately reserved a whole part (Part Seven) for discussion of propaganda of business and labor groups. The place of honor here is occupied by the Public Utilities. The methods employed by these groups to revise text-books which they consider "bad," to influence publishers and authors to insert certain types of information, to exclude others, and to prejudice the youthful mind against public ownership or regulation makes choice reading. The Utilities did things in a big and thoroughly business-like way. Starting with the promise that many educators were "more or less hostile to big business, perhaps due to the fact that they themselves are not successful in a business way" (p. 251), their information committee spared little effort and apparently less money to educate the public as to the proper notion of the obligations of a community to its public utilities. The author deserves our appreciation for the fine way in which she presented this problem.

The concluding part of the text proper deals with the activities of the "Drys" like the Women's Christian Temperance Union and Anti-Saloon League, and some brief comments on the recent agitation of the "Wets" such as the Crusaders, The Women's Organization for Temperance Reform and so forth.

An interesting page appendix containing extracts from various documents and an exhaustive bibliography of fifty pages concludes this part (III) of the Report of the Social Studies

This volume is a valuable asset to social science literature. It is well organized and has an interesting style. However, one regrets that the author does not make any recommendations. We hope that this book, which has admirably presented the problem, will be followed by another that will attempt to suggest the way out. The author is undoubtedly well-equipped to do this.

SCHOOLING MORE NECESSARY TODAY

I WISH that all those who clamor for tax reduction could have opportunity to see what the nations of Europe went through during the last four years of war and how well they stood taxation for schools. I would that they might look back to our own previous depressions and see what communities have stood rather than let their children go without current schooling. I know at those times the average standard of living was not so high. People were not accustomed to certain comforts and luxuries which they now enjoy. Therefore today it seems harder to make sacrifices for schools. But let me call to your attention the fact that as a civilization increases in complexity schooling is more necessary than ever before. For people who lived in an agricultural stage when roads were poor and towns were small and far apart, less schooling was necessary. Literacy was the main requirement. People were born practically under the same conditions and into the same conditions in which their parents were born and would live most of their lives in those conditions.

But today we live in a complex civilization which it is necessary to understand in order to be adjusted to it. Schools are the means by which we accomplish this period of adjustment, and by schools I mean also kindergartens in our larger cities. Even today the schools are not complete. No one claims that a school completely adjusts the pupil to the surroundings in which he lives. It will be necessary for us to give more instruction time to natural science. There is no reason why certain lakes in one of our States should be closed during a most beautiful period of the year because of the plague of mosquitoes. Mosquitoes are creatures whose habits we all know well enough to exterminate if we went about it in the right way. Likewise there is no reason why a hundred people a year should be stricken down by the water moccasin snake in another State. These snakes could be exterminated if we set about it with a little energy. These are merely samples of things that we could do by the application of the fundamental principles in science. They are needed every day.

Moreover, we will have to place much more emphasis on the teachings of mental hygiene not only to adjust people who are normal to their environments, but in order that we may more readily teach them such subjects as good citizenship and good character.

As we come to the end of another school year, I commend the school people of the United States for their service and sacrifice in helping to keep open our institutions of learning, and in helping to maintain our Nation's high standards of education reached only by hard work over long periods of time. Next school year will call for continued sacrifice, but I know that our teachers and our school administrators will carry on courageously, as they have in the past.

WILLIAM JOHN COOPER

When United States Commissioner of Education.

In **School Life** for June, 1933.

ADULT EDUCATION AT DeWITT CLINTON

THE movement for adult education is still in its infancy. Many agencies, both public and private, are engaged in its service. These endeavor to reach into the home and the factory, the farm and the urban community. The opportunities which they offer are so varied and multifarious that to name them would exceed the limits of this article. In the City of New York, the Board of Education offers many courses for adults. Many of these are vocational in character or of an academic grade intended for credit to meet the requirements of a high school diploma. Necessarily, those who apply for such courses are limited in number. They constitute the group that seeks advanced education toward a definite occupational or professional end. The lecture service which is offered by many agencies serves an important function. The lectures appeal to those who are sincerely interested in them for their cultural aspects, or who seek in them an answer to the many perplexing questions which may have caused mental or emotional disturbances. The lecturers are usually specialists, but rarely educators. They place all their audiences on the same intellectual plane and thus often fail in effectiveness.

In facing the problem of educating adults, we must bear in mind that there are many thousands with meager or no educational backgrounds. Some, under stress of occupational and home requirements, have long since forgotten the subjects of their academic days. Others have tried, with the passing years, to keep abreast of the times through the press and periodical literature. The many changes which have been wrought in the home have resulted in an economy of effort and have secured for the housewife a great amount of leisure. A shorter working day is inevitable, and this will give increased leisure to the workers in office and factory. The need for the intelligent direction of this leisure time is already challenging the attention of educators and others who are interested in the social, intellectual, artistic, and economic lives of the masses, as well as of those who are seeking means for the exploitation of this leisure.

To enlarge further on the need for concrete planning to direct intelligently and effectively the non-working hours of the masses is beyond our present purpose. The changes that have taken place in our schools during the past twenty-five years, the many new subjects that have been introduced, the enriched content of the present curricula, and the newer methods of presentation have given to the younger generation knowledge and points of view beyond the ken or comprehension of many elders. With the onset of adolescence, the ties that bind boys and girls to their parents are

Scanned with CamScanner

weakened, and they can only be strengthened through mutual respect and understanding. Where parents cannot meet their children on at least the same intellectual level, there is sure to arise a breach which will inevitably widen with the years and result in the loss of that love, respect, and candor which parents cherish. The home is the place where mutual tastes should be developed, where mutual understanding is essential as the basis for happiness. Where this is lacking, there is no real home life. The home becomes the place of occasional meetings, prompted by necessity and not by intent. True, the amenities of family ties are respected, but the younger folk seek their companionship outside of the home. They have no problems which they can discuss with their parents who live in worlds apart from those of their sons and daughters.

While the picture thus painted may appear an exaggeration, thoughtful consideration will offer ample proof to support it. The teacher who has had years of experience with children of all ages and types knows that the lack of understanding by parents of the life and the needs of the young folks of our present generation is at the root of many of our educational problems.

We do not propose to suggest remedies for the solution of the ills of our social, economic, or educational order. We do feel that much must be done to create an awakened citizenship, to arouse parents to realize that, regardless of their educational antecedents, they must keep on learning to be able to keep abreast of their children, to participate in their discussions, to invite their confidences, and to help them to solve their problems. Through the wise use of the leisure that many parents now possess, they can keep informed regarding modern thought on contemporary problems. They can acquire or improve the cultural background that is necessary for harmonious living both in the home and in the society of those with whom they spend some of their leisure. In this way, they will be enabled to "bridge the gap" and draw closer to their children to the lasting benefit of both.

It was with the hope that he could contribute to the solution of the problem of adult education that the writer projected the Institute for Adult Education at DeWitt Clinton High School. It was his desire to divert the afternoon activities of the mothers of the students of DeWitt Clinton, to furnish them with an inexpensive outlet for some of their leisure time, to create a better understanding of the school and its problems, and to bring them closer to their sons.

The plan for the proposed experiment in adult education by a day high school met with the hearty approval and endorsement of A. Mortimer Clark, Principal of DeWitt Clinton High School, and of Dr. Harold G. Campbell, Deputy Superintendent of Schools, in charge of the high schools of New York City. It was also received with enthusiasm by many members of the Parent-Teachers' Association of DeWitt Clinton High School

of which the writer has been the corresponding secretary and faculty liaison officer for the past three years. It was his hope that the Institute for Adult Education would also become an agency that would bring parents to the school, and that the contacts thus established would create a greater interest in the school and its problems, and point the need for home coöperation with the school and its agencies.

In a carefully worded notice which the writer addressed to the faculty of DeWitt Clinton High School, the plan for the Institute for Adult Education was carefully outlined, and an appeal was made for a staff of volunteer instructors to give some or all of the cultural courses which the writer had projected. The prompt response exceeded the expectations of those who waited for the outcome. Many more volunteered than could possibly be needed in this initial stage of the experiment. A careful selection was made both of the faculty and the courses, and in February, 1932, the Institute for Adult Education of the DeWitt Clinton High School was definitely launched with the writer as its organizer and first director.

It was deemed advisable to limit the experiment to a dozen courses. These included Art Appreciation, Appreciation of Fine Prints, English and American Poets, The Story of the Novel, Modern German Literature and Culture, The Appreciation of Music, Important Movements in American History since the Civil War, Contemporary Problems in World Economics, Problems of Science in the Home, Psychology, Problems of Adolescence, Health Education for Women, and Hispanic Literature and Culture.

Under the caption, "Why Stop Learning?" a mimeographed outline of the plan and a prospectus of the courses were sent to the parents of those students who were to enter DeWitt Clinton in February, 1932, and to the members of the Parent-Teachers' Association which permitted the use of its files. There were 237 women, most of them mothers, who registered during the term for an aggregate of over 400 unit hours. Their interests centered largely in psychology, economics, history, music and art appreciation, the contemporary novel, and health education. Because of the limited size of the classrooms, many could not be registered who arrived late or who wanted the most popular courses.

The exigencies of school conditions and an appreciation of home and other problems determined the selection of the days and the hours for the sessions of the Institute for Adult Education. Wednesday and Friday were fixed as the days on which the classes were to meet, and the hour was set from 3:30 to 4:30 P. M. Each course was limited to fifteen one-hour sessions to be held either on Wednesday or Friday during a single school term. This arrangement has since been modified to permit the extension of some subjects over an entire year of thirty sessions.

The first sessions of the Institute for Adult Education were held on

Scanned with CamScanner

was, indeed, an eventful day. An interested and eager band of women, ranging from twenty-one to sixty years of age, trooped into the corridors of DeWitt Clinton High School long before the hour scheduled for the sessions. Their enthusiasm was contagious, and it fired the imaginations of the members of the faculty who had awaited their coming. The careful preparation and the painstaking effort which this small band of teachers put into their work showed that they recognized the import of their pioneer efforts to the cause of adult education and to the fair name of DeWitt Clinton High School, the largest public high school in the world, whose archives are replete with records of accomplishments. The faculty had volunteered to serve without thought of compensation or reward other than that which comes from the satisfaction of having contributed something to the advancement of the interests of one's fellows and of bringing into the lives of others a little of the knowledge and the culture which it was their more fortunate lot to possess. Such men and women cannot fail.

Those who sat in the classrooms presented an interesting picture. A young woman who had left her baby at home to be cared for by another sat beside her mother—the one eager to learn how to bring up her child in an atmosphere of love and understanding that would bind them closer to each other in the years to come, and the other sensing the futility of the years before her, but still hoping to bring into them some sunshine through the useful occupation of her leisure which the Institute for Adult Education seemed to offer her. Differences of age, race, and creed were forgotten and ignored as the upturned faces awaited the moment that was to herald for most of them the dawning of a new day.

The educational backgrounds of these women were equally as varied. Of the foreign born, many had received some schooling abroad but little or none in the United States. The American born showed equal variations. Those of the older generation had either not completed an elementary school course, or had had a year or two of high school work, or had even spent some time in college. The younger women had had more schooling but were seeking in the Institute for Adult Education an opportunity to continue their studies in fields which their new responsibilities as mothers and housewives made desirable, or which maturer tastes deemed necessary.

The lecture method of presentation was decided upon as the most suitable for our purpose and for the people who came to us. Whenever possible, the lectures were supplemented by demonstrations, illustration, and discussion. The suitability of the lecture method early became apparent, for it gave to the diffident what they wanted and prevented the more forward from monopolizing the period to the discomfiture of the others. Discussion was limited to the end of the period,

and this arrangement made each lecture a completed unit. Class discussion revealed the reactions of the individuals to the material presented and added illustration from the personal contributions of the group. Thus two objectives were served: the imparting of information, and the interpreting of knowledge. It remains for time to accomplish a third objective which will lead to the dynamic application in the home and in the community of those ideas which come from an awakened and enlightened consciousness of the part the individual must play in the society in which he lives.

The Institute for Adult Education is no longer an experiment. Its success became apparent from its very inception. It "caught on" from the very start and has retained its hold on the imaginations of those who came to it. At the closing exercises in June, 1932, more than 150 certificates were distributed for satisfactory completion of the courses which were offered during the first semester. In September 1932, 543 men and women were registered for over 800 aggregate unit hours in twenty courses which covered literature, psychology, science, language, current events, economics, music appreciation, art appreciation, creative art, and health education. To these were added in February, 1933, a course in public speaking and another in the appreciation of the drama. The registration increased during the third semester to 718 for a total of over 1,000 unit hours. While no restrictions were placed upon applicants, only four men were registered for the second and third semesters. Other men who came were interested in vocational courses or such as would give them credits to meet the requirements for college entrance. These were directed to suitable channels.

The success of the Institute for Adult Education at DeWitt Clinton High School points the way to some very evident conclusions. It has sounded the interests of the many whose leisure hours fall during the afternoon and has secured an ever increasing response during the three semesters of its existence. It has discovered that there is need for educational opportunities for this class of adults whose influence reaches into the home where the contacts with the younger generations are closest. From the very nature of their lives and the occupations of their leisure time, this class can exert a far-reaching influence. Nor was the demand for the courses confined to residents in the vicinity of the school. It was far from local. Those who registered came from four of the five boroughs of our greater city. Many came from suburban sections within a radius of thirty miles from DeWitt Clinton High School. Inasmuch as the Institute for Adult Education must limit its offerings to those courses which the faculty of DeWitt Clinton High School is best prepared to give, it could not meet the requirements nor the wishes of all applicants, nor could it accept all who applied because of classroom limitations. This situation was partly

Scanned with CamScanner

remedied in February, 1933, through the use of lecture halls which made possible the registration of 150 in Current Events in an American History Background, 80 in Music Appreciation, 75 in Abnormal Psychology of Adolescence, 70 in Great Masters of World Literatures, and 76 in The Appreciation of the Drama. In fifteen other classes, the registration ranged from 16 to 45, the latter figure exceeding the seating capacity of the classroom.

The experience of DeWitt Clinton High School shows definitely that there are many who would come to the day high schools of the City of New York if the faculties of these schools were to offer cultural, vocational, or industrial courses for adults. These courses would have to be offered in the afternoon, both to economize the time of the teacher and to avoid encroaching upon the hours needed for family duties and home life. There is no room for doubt regarding the practicability of this proposal. There are in the high schools many high minded and public spirited teachers whose eyes are focussed ever on the service it is their privilege to render. These would welcome the opportunity as did the faculty of DeWitt Clinton High School. Institutes thus established would become more local in character, they would serve to bring the school and the home into closer relationship, create a more wholesome regard for education and learning through intelligent treatment and discussion of important questions and problems, point the way towards a wider and better use of leisure, and sow the seeds for an enlightened and active citizenship.

This account of the conception and organization of the Institute for Adult Education of DeWitt Clinton High School would be incomplete were the writer to fail to express his appreciation of the efforts of the many who coöperated in launching this, the first agency of its kind in a New York City high school, and who have labored with him in its service. Without the hearty coöperation of the faculty, the Institute for Adult Education could not have been started; without them, it cannot continue. To A. Mortimer Clark, Principal of DeWitt Clinton High School, the writer owes a special debt of gratitude. His encouragement, his understanding, and his unfailing sympathy in those moments along the way when discouragement threatened the fate of the Institute, served to imbue the organizer with a new hope and the desire to "carry on" and bring his idea to fruition. There are no dark clouds hovering over the Institute for Adult Education now. Its continuance is now assured, and it has opened its lists this fall with a larger complement of courses and every assurance of an increased registration.

S. Alexander Shear,
Organizer and Director of the
Institute for Adult Education,
DeWitt Clinton High School.

AN EXPERIMENTAL CLASS IN MODERN EUROPEAN HISTORY

One of the major difficulties confronting the teacher of history is the failure of some students to perceive the continuity of history, to realize that the aspirations, failures and achievements of the past not only influence the present, but also shed a beacon light upon the possible solutions for issues that face the voters of both today and tomorrow. To some high school students, the textbook assumes the awful proportions of a labyrinthic jungle of facts which ominously challenge the mental digestive system. An attitude of passive resistance to the study of history, which is manifested by some, is frequently the outward manifestation of an inner sluggish feeling towards the subject, resulting from an uninteresting presentation on the part of either text-book or teacher.

During the spring term of 1932, an experimental class in the first term of Modern European History was conducted at the James Monroe High School. The principal objective was to study the historical background of current world problems in their social, political and economic phases so that the student would secure a more intelligent understanding of the present as reflected in the historical perspective of past events. The development of an active intellectual curiosity accompanied by an open-minded, yet critically tolerant spirit of inquiry into the background of major aspects of international affairs, was a primary goal. Stress was placed upon the importance of suspended judgment in forming judicious attitudes predicated upon the knowledge of the relevant facts and tempered by an unbiased attempt to evaluate the reliability of conflicting source material.

The chairman of the Department of Social Studies, Mr. Martin L. Wilson, gave the instructor complete freedom in the preparation of an enriched course of study for this class (see Exhibit A) as well as a special uniform examination (see Exhibit B). Throughout the term, the class studied topics of current interest as found in the daily columns of the *New York Times* and the *Herald-Tribune*, with special emphasis being given to those factors of the 18th and 19th centuries which shed some light of comparison, contrast or causal relation upon the dynamic aspects of the 20th century world of today.

An example of the mode of procedure followed is to be found in the topic "Progress in Disarmament, 1800-1932", which was studied at the opening of the term, thus coinciding with the simultaneous meeting of the World Disarmament Conference at Geneva February 2, 1932 (see Exhibit C). Other topics which were considered during the term were: (a) The Sino-Japanese Conflict in

Scanned with CamScanner

Manchuria; (b) The German Presidential Election of 1932; (c) The Danger in the problem of the Polish Corridor; (d) French presidential election procedure (studied after the assassination of President Doumer, May, 1932); (e) Attempts to balance the United States budget; and (f) World-wide efforts to cope with unemployment. The bulletins and fortnightly reports of the Foreign Policy Association of New York, directed by Mr. James G. McDonald, were found to be invaluable in presenting enlightening interpretations of world history in the making.

Despite this orientation, the customary topics of European history for the period 1789 to 1871, as provided in the syllabus, were woven into the fabric of the term's work. The class was composed for the most part of fifth-term general and commercial and honor school pupils (students whose general average of final marks in major subjects the preceding term was 75% or over). They evinced generally a wholesome, coöperative interest in their work and many sought opportunities to render special oral reports to the class based upon voluntary supplementary readings. A few, however, required special guidance after school in the preparation of their lessons. Daily homework assignments were given, usually in the form of topics with a series of guiding questions for each unit (see Exhibit C). Preparation necessitated reading a newspaper as mentioned above. Occasionally, no definite page assignments or source material were given in order to encourage the students to familiarize themselves with the use of index, table of contents, library catalogue, reference files, current periodicals, and so forth.

The classroom discussions attempted to reach the objective so well expressed by Dr. John L. Tildsley in his "A Challenge to the Teachers," in the following words: . . . "open-mindedness marked by freedom from bias, built up on the realization that every one has something large or small in his experience that is worth-while to another and producing not merely a willingness but a sympathetic eagerness to get the other person's point of view and as conditioning the realization of this quest, a willingness to credit him with honesty of conviction resulting in the power and habit of finding the best in other people."

In the light of experience, the following suggestions are offered: (1) Experimental classes should be composed of more homogeneous groups, i.e., the entire class should be composed of general course pupils exclusively or commercial pupils exclusively; (2) A special experimental class should be formed for commercial pupils who plan to study only one term of European history; (3) The maximum register should not exceed 30; (4) A special library cabinet containing current periodicals, atlases, special reference and recent books should be installed in the room of the experimental class; (5) Experimental classes are more adapted to the interests and abilities of general course pupils; (6) For average pupils, experimental classes should be formed in the second term rather than in the first term of history, since the average pupil will be in a better position to grasp and comprehend the significance of current events and problems after he has obtained a background of European history during the preceding term.

EXHIBIT A (Abridged)

TENTATIVE LIST OF TOPICS FOR EXPERIMENTAL EUROPEAN HISTORY

(ONE YEAR)

(Sequence of topics will depend upon current world problems considered during class discussions.)

I. Permanent Contributions and Influence of the French Revolution and the Napoleonic Era upon modern civilization.
   - A. French Revolution (1789-1799).
     1. Causes: Evils of old régime; spirit of reform, etc.
     2. Results in France: Social, economic and political.
     3. Influence on Europe: Immediate and future.
   - B. The Napoleonic Era (1799-1815).
     1. Napoleon's attitude towards principles of French Revolution.
     2. Reforms in France; influence in Europe.
     3. Causes for his downfall; appraisal of his career.

II. Map of Europe Today Compared with Europe of 1815.
   - A. Reasons for changes since the era of Metternich.

III. The Industrial Revolution and the Labor Movement.
   - A. Significance and historical continuity of the Industrial Revolution.
   - B. Emphasis upon social, economic and political results.
   - C. Factor in development of economic imperialism.
   - D. Growth of Labor Legislation throughout the world.
   - E. Technological unemployment; proposed remedies.
     1. Dole payments in operation (England, Germany).

IV. Extension of Democracy.
   - A. Contrast between evolutionary vs. revolutionary processes.
   - B. Extension of suffrage; English reform bills 1832-1928; other nations; Parliament Act of 1911, etc.
   - C. Comparison of British cabinet system with congressional type.
   - D. Influence of the World War.
     1. Extension of democracy.
     2. Reaction in rise of dictatorships.

V. Nationalism: unifying and disruptive force.
   - A. Revolutionary movements of 19th century (1830-1848).
   - B. Unification of Italy and Germany.
   - C. Disintegration of Austro-Hungarian, Russian and Turkish Empires.

Scanned with CamScanner

D. The Near Eastern Question; 19th and 20th centuries.
E. Nationalist Movements; India, China, Germany, etc.
F. Dangers inherent in aggressive, exaggerated nationalism.

VI. Problems in the Far East.
A. The awakening of China and the westernization of Japan.
B. Relations with Occidental powers; Asiatic imperialism.
C. Japan as a world power; Chinese nationalism; Manchuria.

VII. Imperialism.
A. Imperialistic motives; examples; types of interest.
B. Partition of Africa and Asiatic spheres of influence.
C. Effect of World War; mandate system (coördinate with III, V and VI).

VIII. The World War and Its Aftermath.
A. Causes of the World War.
1. Distinction between fundamental and immediate causes.
(a) International anarchy; militarism; nationalism; imperialism; alliances.
2. Modern concept of relative, divided responsibility compared with "sole guilt clause". (Article 231, Versailles).
(a) Study in the efficacy of war-time propaganda.
B. Results of the World War; political, economic, territorial, social, etc.

IX. The International Peace Movement.
A. Early efforts; Greeks; Pax Romana; medieval "truce of God"; Grotius; Quakers; Kant; Holy Alliance; "Concert of Europe."
B. Before 1914; arbitration; Hague Peace Conferences, 1899, 1907.
C. "Liquidating the war and implementing the peace."
1. League of Nations; World Court; Locarno treaties; the Kellogg-Briand Pact of Paris.
D. Disarmament; Washington (1921-22); Geneva (1927); London (1930); World Disarmament Conference 1932-1933.
E. Reparations; 1919; 1921; Dawes Plan; Young Plan; Lausanne, 1932.
F. Attitude of United States on (a) Implementing the Kellogg Pact; (b) Membership in World Court; (c) Disarmament.
G. War or Peace in the Far East; a test for peace machinery.

X. Revision of the Treaty of Versailles; Danger Zones in Europe.

XI. Evolution of the British Commonwealth of Nations.
A. From Empire to Commonwealth plus Empire.

XII. Progress of Civilization; Social Developments.
A. Developments in Science, Art and Literature; unsung heroes of peace.
B. Emancipation of Women; social, economic and political.
C. Growth of Public Education.
D. Relations of Church and State; Italy, France, Russia, Turkey and Spain.
1. Growth of tolerance.

XIII. The World as an Economic Unit; interdependence of nations.
A. World-wide scope of Industrial Revolution (topic III).
B. Reasons for England's reversal of traditional free trade.
C. Factors contributing to world-wide business depression.
1. The rôle of economic nationalism, etc.
D. Significance of "Planned Economy": Russia's 5-Year Plan.
E. Recent proposals for adjustment of reparations and Allied war debts owed to the United States (Hoover moratorium).
F. Specific examples of how conditions in other parts of the world affects the United States.

XIV. Opportunities and Obligations of World Leadership for the United States.
A. Problems confronting the World Monetary and Economic Conference (1933).

EXHIBIT B (May, 1932)

I. Name and locate on the accompanying map of Europe:
1. The city which is the headquarters of the League of Nations.
2. The capital of the nation which is following the Five-Year Plan.
3. The capital of the nation which became a republic in 1931.
4. The Polish Corridor.
5. The capital of the nation which adopted a protective tariff policy in 1932, thus abandoning free trade policy.

II. "The world has witnessed progress in the limitation of armaments since 1918."
A. Compare the Washington Conference (1921-22) with the London Naval Conference of 1930, by giving (in tabular form):
1. Accomplishments of each conference.
2. Unsolved problems of each conference.
B. Mention two difficulties which face the statsemen now meeting at the World Disarmament Conference at Geneva.

III. State five contrasts between France before the Revolution of 1789 and France today. In-

Scanned with CamScanner

clude political, social and economic contrasts.

IV. Below are four groups of related topics. Show the connection between the items in each group:
   (a) Industrial Revolution and Dole Payments.
   (b) Industrial Revolution in England and the downfall of Napoleon Bonaparte.
   (c) Social Contract and the French Revolution.
   (d) Industrial Revolution and Protective Tariffs.

V. Prove that the Monroe Doctrine interfered with the plans of Metternich and the "Concert of Europe."

VI. (a) Mention three outstanding events in the history of Polish nationalism during the period 1772 to 1932.
   (b) Why is the Polish Corridor a danger to the peace of Europe today?

VII. Show why three arrangements made at the Congress of Vienna (1815) were overthrown or changed by later events of the 19th or 20th centuries. Indicate the nature of each change.

VIII. Mention one important historical fact connected with ten of the following:
   (a) Montesquieu
   (b) Hitler
   (c) Karl Marx
   (d) Gandhi
   (e) Seabury
   (f) Stimson
   (g) Kossuth
   (h) De Valera
   (i) Stalin
   (j) Goethe
   (k) Shanghai
   (l) Von Hindenburg

EXHIBIT C

Progress In World Disarmament

An outline of questions for study and discussion.

I. Introduction:
   A. The problem of reducing armaments is of vital interest to every citizen.
      1. World expenditure of over $4,500,000,000 for armaments in 1931 (a year of peace) of which the United States spent over $725,000,000.
      2. Over two-thirds of money spent by the U. S. Government during the first nine months of the fiscal year of 1931 was devoted to "present military purposes and to pay the bills of past wars". (The amount was $2,124,737,000 out of total expenditure for all purposes of $3,126,540,000.)
   B. Preview of the 1932 World Disarmament Conference.
      1. What are the objectives of the Disarmament Conference now meeting in Geneva?
      2. Why do nations maintain large armies and navies in time of peace?
      3. What undesirable results arise from international rivalry in armaments?
      4. How may the members of your family be affected indirectly by the success or the failure of the present conference?

II. Historical Background (before 1914).
   A. Survey of the 19th century.
      1. How did Napoleon make use of the French military conscription law of 1798?
      2. Why did Prussia adopt compulsory military service after Napoleon's victory at Jena (1806)?
      3. Why did other continental European nations adopt military conscription after 1870?
      4. Why did England rely upon a small standing army without the use of conscription?
      5. Why did Anglo-German naval rivalry develop about 1900?
   B. The Hague Peace Conferences of 1899 and 1907.
      1. Explain reasons for the failure of these conferences to limit armaments.
      2. Would you consider them a total failure? Why?
   C. Europe in 1914.
      1. Why was Europe called an "Armed Camp" before August 1914?
      2. Do you agree with the statement, "A nation with strong armaments will remain at peace since it is thereby insured against war?" Justify your answer by referring to historical facts.

III. Steps in the Evolution of Disarmament.
   A. The Treaty of Versailles (1919).
      1. What limitations were placed upon the German army and navy? Why?
      2. Why was the term of voluntary enlistment in the German army extended to 12 years by the Treaty of Versailles?
      3. What pledge regarding disarmament are the members of the League of Nations obligated to carry out? (See article 8 of the League Covenant and one of Wilson's 14 Points, 1918.)
   B. The Washington Conference on Limitation of Armaments (1921-22).
      1. What were the major purposes of President Harding for calling this conference?
      2. What was the significance of the 10-year naval holiday?
      3. What agreement was made concerning battleship ratios in the 5-Power Naval Treaty?
      4. Why was Great Britain willing to grant the Uni-

Scanned with CamScanner

ted States naval parity (equality) in battleship tonnage? (Distinguish between capital ships and auxiliary vessels.)

5. Why were France and Italy willing to accept small ratios in capital ships?
6. Why was Germany absent from the Washington Conference?
7. What types of armament were not limited? Why?
8. How did the termination of the Anglo-Japanese alliance increase mutual friendship among the United States, Great Britain and Japan? What agreement replaced it?
9. Why were Japan and China more friendly in 1922 than they had been in 1919? (Refer to 9-Power and Shantung treaties.)

C. The Geneva Conference of 1927.

1. What unfinished work of the Washington Conference did the 1927 Geneva Conference attempt to complete?
2. Why were the United States and Great Britain unable to agree?
3. Which nations declined President Coolidge's invitation to attend?

D. The London Naval Conference of 1930.

1. Why did Ramsay MacDonald, British Prime Minister, visit President Hoover in 1929?
2. Which nations attended the London Conference? (Compare with Geneva 1927 conference.)
3. What agreements of the Washington Conference were extended? Why?
4. What agreement was reached in the 3-Power Naval Treaty affecting the United States, Great Britain and Japan?
5. What obstacle prevented the making of the proposed 5-Power treaty?
6. Why did Italy demand the right of naval parity with France in cruisers despite Italy's financial inability to construct enough cruisers to actually achieve such parity?
7. How did France justify her stand in this matter?
8. Why did the United States decline to enter into a "consultative pact" with France providing for international consultation in the event that France were attacked in the future?
9. Why did the British reserve the right to exceed the naval ratio limits set in the 3-Power Treaty? (Escalator clause.)

10. What agreements were made regarding submarine warfare? Why?

E. The 1932 World Disarmament Conference at Geneva

1. How do the objects of this conference differ from those of previous disarmament conferences?
2. Why do nations continue to maintain substantial armies and navies despite the fact that 58 nations, by signing the Kellogg-Briand Pact of Paris, have renounced war as an instrument of national policy?
3. Why do continental European nations place greater reliance upon armies and air forces than upon naval strength?
4. What do the French mean by their willingness to reduce armaments in return for "additional guarantees of security"?
5. What effect do German demands for revision of the Treaty of Versailles and reparations have upon the French attitude on disarmament?
6. What connection is there between the world-wide depression and demands for armament reduction?
7. Why do some demand the total abolition of (a) battleships, (b) submarines?
8. What international machinery for the peaceful settlement of international disputes exists today which did not exist when the World War broke out?
9. What are the outstanding obstacles to disarmament today?
10. Why do many scientists predict the end of modern civilization in the event of another world war?
11. Why do many feel that the success of this conference depends in part upon the outcome of the present Sino-Japanese crisis?
12. What is your opinion of the French proposal for the creation of an international military police force under the control of the League of Nations? (See newspapers for Tardieu proposal of February 6, 1932.)
13. What would probably be the attitude of the United States Government towards this plan?
14. Why is the fate of civilization partly dependent upon continued progress in disarmament?

THE PROJECT DEVELOPMENT OF ELECTRICITY AND RADIO IN AN ADVANCED PHYSICS COURSE

AS teachers, we all like to see pupils busily at work, intent on making their job a good one. The laboratory work in elementary physics allows the pupils to work with the things they are studying about, to some degree, and is mostly of a formal nature. But here we wish to write about what the pupils can do and have done when conditions permit a wider opportunity for student activity and constructive work. Although these opportunities are mostly offered in an advanced physics course, some of the projects mentioned, where possible to include them, will fit effectively into elementary work.

About five years ago, a one-term course in Advanced Physics was introduced by our head of department, Mr. H. E. Behnken. It offered opportunity for growth in physical science to all students, and particularly filled a decided need in answering the demand by gifted students for material suitable to their abilities. The importance of this need is stressed in the report of the First Assistant's Association Committee (see note 1 below), which states: "Growth in physical science is chiefly made through contact with scientific apparatus and inspiring, sympathetic teachers". Passing rapidly over the second half of the quotation, we heartily agree with the point made in the first half. The physics teachers have been allowed a wide latitude in developing suitable material for this course, and, as a result, there has been a continuous development of varied projects. We have found the project method particularly suited for this work as it gives the student a real understanding of the function of apparatus through actual use. There are individual jobs to allow for personal initiative and group projects for training in working together.

Although projects can be drawn from any division of physics, we are listing here the projects in electricity and radio as a *nucleus*, as we have found these topics to fit in best with the apparatus available and the natural student interest. The course, built around this nucleus, may very well, and in our case, does, include associated topics from the other fields, in particular, Light, Heat, Sound, and a project in recognition of the much-neglected field of Popular Astronomy. To illustrate: in connection with the topic "Conduction (of electricity) through gases", we associate spectroscopic observation of the gases used.

The list, given below in outline form, is to be regarded, then, as suggestions from which to draw projects in electricity, and to which to add projects from other fields—according to particular conditions. Where hints given are not enough detailed, the authors may be consulted. The list is divided into 11 suggested projects, 8 demonstrations and 7 optional additions.

OUTLINE OF PROJECT DEVELOPMENT OF ELECTRICITY AND RADIO

Conduction through solids

Projects

1. *Measurement of Resistance* (using 3 methods: Voltmeter-ammeter, Ohmmeter circuit, and Wheatstone bridge. Suitability of methods for hot and cold resistance brought out.)
2. *Converting Galvanometers into Ammeters and Voltmeters* (using ordinary meters, B. & S. wire table for shunts; and radio carbon resistors filed to suit for series resistors).

Conduction through liquids

3. *Copper Plating* (to show requirements for good plating).

4a. *Determination of e from above* (explained below in text).

or

4b. *Plating of metals other than copper* (students given choice of 4a or 4b).

Magnetic Effects of a Current

5. *Constructing Devices to show effect of Magnetic field* (each subdivision assigned to a group; groups work concurrently).

5a. Oersted's apparatus, with small compasses mounted.

5b. Tangent galvanometer (coil of wire and compass).

5c. Barlow's wheel.

5d. Dancing spiral (pool of mercury contact to show attraction of parallel currents).

5e. Parallel Wires.

Optional: Magic magnetic pendulum (current induced

Scanned with CamScanner

in swinging coil by magnet causes second coil to start to swing over its magnet).

6. *Assembling and Winding a Simple Motor* (using K. & D. or Moore moters, both knock down, 1½ volt).

Alternating Current Phenomena

7. *Construction of Simple Transformer* (may be done as a magic lamp; coil wound on an oatmeal box and hidden; connected to flashlight bulb-box to be placed over an iron-core coil carrying A.C.).

DEM. 1: Demonstration showing difference between AC and DC on inductances, condensers and power.

DEM. 2: Demonstration of moving magnetic field. The stator of a 4-pole motor may be split up to provide a rotating field to affect a floating copper ball (density ball).

or

2b: Aluminum ring over iron core of coil carrying A.C.

DEM. 3: Demonstration of resonance at power frequencies.

Electron Phenomena

8. *Construction of Thermocouples to produce current.* Using common metals in laboratory (iron, copper, nichrome wire, etc.).

Application in pyrometer.

9a. *Constructed Model* to show attraction of charged particles from smoke by electrified plate (as per John A. Clark).

or

9b. *Constructed Model* to show production of electrons by glowing filament (electroscope used to test charge on aluminum plate near glowing iron wire in air).

DEM. 4: Conduction through gases (low pressure air and other gas discharge tubes).

DEM. 5: Simple oscillograph, using rotating mirror with special gas discharge tube or tuning fork. (This Demonstration can be performed by students.)

DEM. 6: Demonstration of photo-electric effect, using photo-electric tube, and relay to ring bell.

Optional: Construction of photo-voltaic cell, using cuprous oxide plates from discarded rectifier with lead ring in lead nitrate solution.

RADIO

DEM. 7: Demonstration of production and reception of radio waves using Hertz apparatus and static machine (can be performed by students).

DEM. 8: Demonstration of rectifying action and use of curves to indicate vacuum tube rectifier action.

Optional: Effect of filtering action shown by meters or audible means.

10. *Construction of simple vacuum tube characteristic curves.*

Optional: Construction of simple crystal set.

11. *Construction of a 1-tube radio set and test for its operation.* Simple regenerative circuit is built individually, while the accessories necessary for testing are used in common (as explained below in text).

Optional: Converting radio set into an audio oscillator for practical use by student as a code-practice set. (See Note 2.)

Optional: Construction of 2-stage amplifier (without accessories).

Optional: Demonstration of simple 1-tube A.C. operated transmitter.

CLASS PROCEDURE

The class procedure will naturally vary according to the type of project selected and the different conditions under which the class is working. For this reason, little will be said about it except in the particular cases selected below. However, there is ample reason for including other methods, such as reports and talks by students on interesting topics and trips to industrial plants, as the occasion arises, although there is no room here for any emphasis on these methods.

One experiment given to students who show particular aptitude is the determination of the charge of the electron (project 4a) from copper-plating data. A typical report recently handed in will best illustrate:

Copper plate before plating	28.177 gms.
Copper plate after plating	28.877
Weight of copper plated	.700 gms.

The current through solution was

A 3 amp. for 5½ minutes	= 17.5 amp. minutes
B 2.2 amp. for 0.5 minutes	= 1.1 amp. minutes
C 2 amp. for 7¾ minutes	= 15.5 amp. minutes
D 3.2 amp. for 1¼ minutes	= 4/ amp. minutes
	38.1 amp. minutes

48 amp. minutes	= 2286 coulombs
Weight of copper plated per coulombs	= .000306 gms. = 3.06×10^{-4} gr.
Weight of Hydrogen atom (reference)	= 1.662×10^{-24} gm.
Atomic Weight of Copper (reference)	= 63.57
Weight of copper atom	= 105.7×10^{-24} gms.
Number of atoms in one coulomb	= 2.89×10^{18}
Valence of copper	= 2
Number of electrons in one coulomb	= 5.78×10^{18}
Exp. Result—One electron possesses	= 1.73×10^{-19} coulombs
Valve from tables— One electron possesses	= 1.59×10^{-19} coulombs

Scanned with CamScanner

The ammeter used was graduated in .2 amperes steps and probably no more accurate than 3% or 4% . In weighing the plates the chemical balance is used, mainly to enable the student to familiarize himself with it. The errors possible in its use are much smaller than the ammeter errors. The final result lies within the possible experimental error of the student and equipment.

RADIO PROJECT

The work on the radio project (No. 11—construction of a 1-tube radio set and test for its operation) presented many problems and was introduced with much misgiving. Yet it turned out to be the most interesting and vital part of the course. Difficulties due to the technical nature of the subject and lack of any radio supplies, as such, melted away in a surprising way before the eagerness of the students, who felt that they had an interesting job to do and the very definite goal to aim at, of showing that their set would work.

The first step was to lay the groundwork of an understanding in the simplest possible terms of the essentials of radio reception. This was done with two simple demonstrations. In Demonstration 7 the sparks from the static machine produced the high frequency oscillations which sent out the radio waves in conjunction with the tuned circuit of the loop of wire and the Leyden jar of the standard Hertz apparatus. The students convinced themselves of the possibility of receiving this energy through space by their own manipulation of the similar tuned circuit for receiving the spark when in tune with the transmitter. In Demonstration 8 the possibility of rectifying these received high frequency oscillations was demonstrated by the action of tube and crystal rectifiers on 60 cycle A.C. Discussion of the effect of the grid in 3 element tubes followed, using the method of drawing curves for the tube action. Then the diagram of a simple crystal set was given, the symbols explained, and the parts discussed until the function of each part of the apparatus had penetrated. The construction of such a crystal set was not required—except as an additional option. During this time the pupils had been furnished with a list of the parts required for the 1-tube set, namely:

1 Coil (broadcast wave or short wave, first used as non-regenerative tickler, winding added later).
1 Variable condenser (about .00035 mfd.).
1 Tube socket (4-prong).
1 6-ohm rheostat.
1 Grid leak (1 to 5 megohms) and fixed grid condenser (.00025 mfd.).
1 Baseboard.
1 Panel.

Those pupils who did not wish to do their own shopping were told to turn over 15 cents to one member of the class in charge of parts, and that this would cover all the parts required. It is possible to do this with such a small sum by forming a common class fund. An out-of-date 5 or 6 tube battery set can be bought for

about 50 cents or less by judicious shopping at Radio Row on Cortlandt Street, which will provide parts for three boys, with plenty left over after it has been broken up. There will always be found a group of boys in the class for whom this task will be a special privilege, and when a suitable set for breaking up has been selected, it yields the three coil and condenser combination and sockets usually mounted in a form ready to make the basis of three separate single tube sets. The question of extra rheostats, grid leaks and fixed condensers usually results in a barter and exchange process among the students that works out beautifully by itself with the minimum of teacher help. We have found the members of our Radio Club willing and anxious to take care of this exchange of parts together with the supplies of the club, because it usually results in a net increase for the club, since a few discarded sets are usually hauled out of cellars and brought in gratis for the common supply. As a matter of fact, the period of getting parts usually ends with a surplus of the so called "junk parts" piling up, all perfectly suitable for class work, so that a supply of such parts quickly builds up and causes no problem. The accessories are to be available to the class in common. For putting up an aerial and ground system willing hands are easily found. The "A", or filament supply, is provided by the laboratory's storage battery or four cells. The "B", or plate supply, can be the laboratory 110v. D.C. outlet if necessary, but one of the pupils invariably brings in a "B eliminator" supply which serves for the class, making it unnecessary to touch the Radio Club's power supply. Phones are part of the laboratory equipment. We usually find more than half of the class already supplied with tubes (usually of the O1A type) salvaged from all sorts of places so that little lending of the tubes for testing is necessary. For the actual construction and testing about six laboratory periods may be allowed since the pupils, once started, will petition to be allowed to come in at all odd hours to work on their sets and try them out. The pupil who has been carefully selected as tool-master and is responsible to the teacher can be in charge of the accessories under the supervision of any teacher or laboratory assistant who happens to have some work keeping him in school at that time. It should be realized, however, that usually any arrangement made will draw on the teacher's own time, which is the price that must be paid for the gratifying results achieved in going outside of the strictly formal work.

Surprising examples of student ingenuity spring up. In one case, the set built by a girl in the class put the products of some of the supposedly "handy sex" to shame.

Though the set belongs to the pupil to take home, if he wants to, there will be little incentive for him to use a little one-tuber at home in competition with the family's electric set, no matter how proud he is of his own handiwork. For this reason, the set has more practical use if built with a

Scanned with CamScanner

short-wave coil (as for police broadcast and amateur waves). Another way of putting the parts to practical use is to convert the set into an audio oscillator to be used for code-practice work in learning the international code with a friend. This is done very simply by the addition of an audio transformer as shown in the January issue of *Radiocraft*, in Fig. 1 of the article on "The Meterless Tube Tester" (see note 2). As a matter of fact, it was just this problem of finding a practical use for the parts in the one-tube set that gave the writer his idea for the article, since this code practice set carried a little further results in a practicable tube tester.

And so we think that this particular topic of radio quickly awakens real interest on the part of the student, for which he is amply repaid in the thrill he gets when the first sound from the air reaches his ears through the product of his own hands. An uninformed observer, watching the testing of the sets, would surely think that each pupil, in his turn, was the inventor of Radio.

Note 1. Report of the Committee of the First Assistants' Association for the Study of the Problem of the Instruction of Pupils Gifted in Physical Science.

Note 2. Constructing the Meterless Tube Tester, by Sol D. Prensky. *Radiocraft*, January and February issues, 1933.

SHOULD WE INDOCTRINATE?

ONE hears considerable discussion these days on the question, "Should we indoctrinate?" To realize how far we have travelled pedagogically, one must bear in mind the fact that such a question would have been treated with derision a few years ago, if noticed at all. Today it receives the serious consideration of scholar and teacher alike, heretical as it sounds to some. With a view to soliciting a comprehensive and authoritative statement from the school officials, the following brief treatment is tentatively and respectfully submitted.

Acknowledgment is made at the outset to the inspiring words of Professor Counts, whose little pamphlet[1] it is sincerely hoped will be perused by all teachers looking forward to a better social era.

First of all let us attempt an answer to the question, "What is indoctrination?" Teachers have been loathe to commit themselves even on the point of definition. The writer assumes that indoctrination means the taking of a controversial social question, one about which there exists an honest difference of opinion between different members of society, a decision as to which of the several possible answers is the best answer, and then the presentation of the subject to the students with the intent that they may be convinced that the best solution is the one favored by the teacher. Indoctrination involves a question about which reasonable men might conceivably differ, not the presentation of a platitude or a truism. It means teaching with a motive, over and above the contents of the subject itself. It means persuasive teaching, with the hope that the students will "see things" the way the teacher does.

Should we indoctrinate? This is a question that cannot be dodged, that demands immediate attention, and that is charged with social consequences, whichever way we answer it.

Let it be understood that it is not the inculcation of any and all ideas by any teacher who so takes a fancy or notion to teach that we are here considering. There are certain limitations that any plan of indoctrination would have to recognize. Of course there must be no distortion of the truth to serve the purposes of any doctrinaire group or political school. There must be no covert foisting of any political paneceas on our students. Eclectisism would seem a more desirable point of view. There must be no instilling of ideas divorced from reality. The sole justification for indoctrination would be the desire to get back to the reality from which so much of our curriculum has strayed. Where the answer is purely conjectural there would be no value of indoctrinating any particular answer. Unless there exists a reasonably strong attitude, found in the vast majority of scholars in any particular field, indoctrination is out of place. Where the chief benefit of the study is derived not from the solution, but from the search and pursuit of the solution, indoctrination is clearly out of place. Where the question concerns matters of purely private attitudes, such as questions of religion, no attempt should be made to indoctrinate.

Let us make our discussion concrete, so that we may have a common basis upon which to argue. Suppose, for instance, all the social science teachers, or their delegates, were to meet in a vast hall, decide what are the ten major problems of the day crying out for a solution, discuss them pro and con, reach certain decisions as to what they thought was the best avenue of approach and treatment, discard those points about which there did not seem to be any agreement or very little agreement, formulate the procedures and convictions about which there seemed to be strong agreement, as for example 90% agreement, and then march from the room, with the common objective of indoctrinating our students similarly. What opposition and complaint would there be to such a scheme?

The historical objection has been raised that the Jesuits have tried indoctrination in the past and that they failed. The results in the case of the Jesuits would seem to be a strong argument in favor of indoctrination. Judged from their own motives they succeeded preëminently. Judged even from hostile Protestant contemporaries their schools were the best of the day.

[1] G. S. Counts: "Dare the School Build a New Social Order?" The John Day Pamphlets, New York.

Scanned with CamScanner

Some say that to indoctrinate is to put the schools in politics. That is apparently urged as a calamity. The argument proceeds that it would prevent us from complaining if politics come into the schools. The implication is that schools and politics are as far removed as the poles, and never the twain shall meet. On the other hand, perhaps one of the most powerful complaints made against the schools is that they are too removed from society, and society apart from politics has no significance. "Until school and society are bound together by common purposes the program of education will lack both meaning and vitality."[2] "In their own lives teachers must bridge the gap between school and society, and play some part in the fashioning of those great common purposes which should bind the two together."[3]

If teachers have the right to guide youth in the formation of social concepts they will at once become the target for all kinds of pressure agencies. Interested groups will immediately try to move heaven and earth to win the teachers to their side in order that their particular views may be foisted on the students. When that day comes, perhaps, then teachers will come into their own. For too long have the views and opinions and social philosophies of teachers been ignored by those wielding political power. And the argument assumes that teachers as a group are a set of invertebrates, who would accept first one conception or school of thought, and then another. "That the teachers should deliberately reach for power and then make the most of their conquest is my firm conviction."[4]

Will indoctrination lead to chaos? Teachers will start teaching pet eccentric notions, each presenting individual, self-contradicting, socially-unsound ideas, the result being confusion worse confounded. Is such a result likely to follow? By having the best scholars of the social sciences ponder and weigh all questions before they are handed down to our students, such a situation just described is avoided. And surely if the parents of our students have faith in us at all as teachers of their children, then they should have faith in our ability to guide them in more than the learning of mere academic matters.

The objection might be raised that indoctrination is incompatible with democracy. Is our democratic form of government challenged when our teachers mold our youth to think along certain definite lines, and is our democracy "safe" when they are left to their own resources to think along any lines, or along no lines at all, as most of them choose to do? It is contended that we should "refrain from disposing of concrete issues or public procedure, but should rather put our trust in the unfettered processes of enlightened democracy."[5] Is this not a fool's paradise we are living in, this assumption that students and even adults come to decisions "unfettered"? Who would dare to deny the fact that we are all of use being continually bombarded with arguments for or against a certain course of conduct by self-seeking groups, either via the press, radio, movies, billboard, or a thousand other channels? Is a callow youth in a better position to decide these vital questions than a thousand experts?

Is it true that indoctrination is the denial of toleration? Sometimes this question is asked in all seriousness. It seems to indicate a confusion between two different concepts. What is here being considered is simply a question of presentation of a point of view, and not a forced shaping of the minds of students along certain channels with a penalty attached if the students just "don't see it that way," à la Herr Hitler. In the last analysis the matter rests with the individual student. This is not an argument for the suppression of opposing ideas, but the giving of one additional fact, and that is that one of the two solutions or attitudes is the better one in the opinion of the vast majority of scholars. There is "the fallacy that the school is an all-powerful educational agency . . . the school is but one formative agency among many, and certainly not the strongest at that. Our major concern should be, not to keep the school from influencing the child in a positive direction. . . . If the school should endeavor vigorously and consistently to win its pupils to the support of a given social program, unless it were supported by other agencies, it could act only as a mild counterpoise to restrain and challenge the might of less enlightened and more selfish purposes."[6] Because we have had instances of indoctrination and intoleration going hand-in-hand together, as for example Soviet Russia, it does not follow as a logical necessity that the two must be associated and are inseparable and concomitant.

The objection might be advanced that our students should not be made the subjects of an experiment. Upon them, as upon so many guinea pigs in the laboratory, we should not inflict the untried hypothesis of schoolmasters and schoolma'ams, people cut off from all contact with the "real" world and having as a consequence, no significant grasp of contemporaneous problems. There are two erroneous implications in such an argument. First, if some of the people who sit in the places of power had one iota as much vision of some of the people who sit behind the classroom desk we would not now be "in the ditch," to quote G. B. S. Second, the statement doesn't appreciate the fact that our students are every day being experimented with, but only in a haphazard, trial-and-error, hit-or-miss fashion. "Either consciously or unconsciously, directly or indirectly, we as teachers and writers of texts bring it to pass that the boys and girls who have been under our guidance come into the possession of certain assumptions. . . . It is highly desirable that we, as instructors of the young, should

[2] Counts, supra, page 17.

[6] Counts, supra, page 24.

Scanned with CamScanner

be conscious of the assumptions we are building into their minds, and that we should do this work directly rather than by indirection."[7] Indoctrination is thus inevitable. There is the indoctrination for the *status quo* or the indoctrination for the change, the indoctrination to make conservatives, or indoctrination to make liberals. The issue cannot be avoided or straddled. You are either for one form of indoctrination or for another, whether you realize it or not.

Is it true that indoctrination would be futile? What might be unanimous today might be thrown overboard tomorrow. Should we therefore stop teaching economics today because the principles might become obsolete tomorrow? And should we discard the best literature of today since something better might be born tomorrow?

Will indoctrination discourage independent thinking and lead to a static condition of society? Will our students become converted into sponges, absorbing what opinions the teachers have, and never bothering to scrutinize the issues for themselves? Is there an intellectual passivity that we will be engendering in the new generation? This raises the question: Is there at present any substantial satisfactory amount of independent thinking going on in our student body as a whole? Surely any research concerning the amount of independent thinking, cerebral activity, apart from the classroom incentives or rewards and punishments, will leave the census-taker crestfallen and hopeless. And what spontaneous, courageous thinking one does find in the few isolated cases, will that be endangered with indoctrination? Does one vainly suppose that he could extinguish the fire, even if he had a mind to? And will it not encourage bold individualistic responses on the part of our student body, this treatment of social science problems with the reviving, stimulating touch of conviction, this presentation of questions as though they really mattered, and not as one generally finds, in a merely academic way, just something to be written out on examination day, and then to be dropped like last season's clothing?

Let us consider some arguments in favor of indoctrination within the meaning of the term as herein used. There is, first, the pragmatic attitude, the old methods don't work. The teacher of the conventional stamp will say, "These are the arguments for (or advantages of) this attitude, and these are the arguments for (or advantages of) the other attitude. You decide in your own mind which you think is the better viewpoint." Result? In a time when our citizens are paying more for schooling than ever before in history, our citizenry are miserably unprepared to meet the pressing social questions of the day and decide accordingly. A cynicism bordering on contempt and disgust is visible in many quarters towards this whole business of democracy. Most people don't vote either because they can't and don't care to qualify themselves, or because they realize the futility of voting; those that do vote are either in the grip of a family tradition or a political machine. Is it to be wondered at that corruption, prevarication and social injustice are taken for granted? The "take-your-choice" methods of yesteryear seem to have produced a very poor crop. "Society requires great numbers of persons who, while capable of gathering and digesting facts, are at the same time able to think in terms of life, make decisions and act."[8] "It is a fallacy that the great object of education is to produce the college professor, that is, the individual who adopts an agnostic attitude towards every important social issue, who can balance the pros and cons with the skill of a juggler[9] . . . waiting until the solutions of social problems are found when as a matter of fact there are no solutions in any definite and final sense."[10] To take one simple example, of what avail is it to drill our students to glibly recite, memoriter, all the arguments for or against high tariffs, if when they become of voting age they lack the emotional, passionate desire to help their country solve this vexing problem, and, furthermore, become innocent tools of self-seeking interests who drive the country and the world into the most distressing economic and tariff war of which history has any record? To pursue this single idea still further—approximately 95% of our economists favor immediate downward tariff revision, the unanimous vote of the World Economic Conference in 1927 (when tariffs were incomparably lower than they are today) urged downward revision, and yet what do our students think about the tariff? Some are for a higher tariff, some for a lower, most of them are just indifferent. Is this successful teaching?

That the times are out of joint is trite. That this fact calls for modifications in our teaching processes is not quite so accepted. Were we living in a placid, inconsequential era we could very well plod along in the beaten track. Teachers must today come out of their apathy. Each of us, like the prophets of old, must independently hear the call to serve and to save a collapsing world. The shameful fact remains that some of us have awakened to the catastrophic changes of the day and have become socially-minded only when our checks were in jeopardy. Surely our vision extends further than "signing the payroll." The fortunate or unfortunate fact remains that the payroll is dependent upon our coming to a realization of our responsibilities, and that very soon. We sometimes resent being called "pedagogues." But are we even entitled to be so called when we refuse to take the initiative and guide the child? The original meaning of the word was one who guides or leads another. If we refuse to help the student see the light in this world of social darkness, then what name shall we earn? When your house is on fire will you tell your child who may be just learning to walk that there are

[7] W. E. Myer, supra.

[9] Ibid., page 20.
[10] Ibid., page 21.

Scanned with CamScanner

several ways to go about this process, and that now is a good chance to try out what he thinks is the best way? Or will you snatch him up in your arms and scurry out of the building? The world is now on fire, on fire in many serious ways. Many of our "principles of education" have been relegated to the limbo of the forgotten, all in the past few years. Is it time now to make one more "adjustment"? I don't know.

Indoctrination has been urged as a necessity of good teaching, teaching with vitality and nerve. I suppose there is no more punishing an experience for a child than to be exposed to a teacher who has nary a conviction or a belief of his own, who just "hands out the stuff," encyclopaedically, whose heart throbs with no desires or passions save that of going through the daily tasks. A most bloodless individual, you will say, and altogether impossible. Yes. And nonexistent? No. Our text-writers urge the necessity of personality in the teacher. But what if the pedagogical procedures drive the little personality we have out of us, and leave us colorless and dry?

At this point the patient reader might exclaim, "Well, let's get down to cases. If you would indoctrinate, on what subject would you start"? I have indicated above that this fundamental question would be decided not by any individual teacher, but by all the teachers collectively, especially the social science teachers. (The writer at this stage advances with trepidation.) Just to be suggestive, surely there is a good and a bad answer, almost as there is in algebra, to many current questions. In municipal affairs, proportional representation vs. ordinary voting, apathy or fiery indignation towards domination by unelected politicians and bankers; in state affairs, minimum wages or not, unemployment insurance or not; in national affairs, more disarmament or not, curbing of enormous concentration of wealth by higher surtaxes or not, and so on.

I pause to hear the gentlemen (and ladies) from the other side of the house.

ABRAHAM GEDULDIG.

Julia Richman High School.

THE CONTEMPORARY SCOTTISH NOVEL

THE Scottish novel has gone a good distance from the old kailyard school and from the S. R. Crockett territory. It has become less provincial, if no less localized. It has become less a matter of tortuous dialect and caricatured characterization, like the somewhat blatant J. J. Bell stories of Clydeside, almost Scottish replicas of W. W. Jacob's uproarious seamen, and has acquired more real strength in depicting situations and conflicts under conditions factually Scottish, but universal in their application. That is one particular and no small reason why the Scottish novel is assuming a notable place in contemporary letters.

It was, all unknowingly, Douglas himself, with his "House with the Green Shutters," who started the ball rolling by his emphasis, not on the turn of speech of the protagonists, but on the inherently dramatic elements of the narrative, with the tragic old carter battling his blind way through a fatalistic climax, and his pitiful son wrestling, but ineluctably, with his cataclysmic end. Dr. Cronin, in "Hatter's Castle," is now doing something similar, with a broader sweep, although there is no implication of direct imitation; both men, rather, draw from the same fountain-head, a transmutation of the life they know.

It is not startling that a Scotsman should know the locale best, and sense the proper atmosphere and be attuned to catch those fugitive touches of manner and racial peculiarities that only one who is steeped in Scottish living can honestly possess. For the Englishman who writes of Scotland (pace Dr. Johnson) invariably becomes ridiculously fatuous, to recall nothing more heinous than the notorious line from Alfred Austin about the cows returning to the byre.

Who are the present fashioners of these Pictish tales? There are two types. There is the writer who confessedly places on his stage the traditional Scotsman, red-headed and not infrequently bibulous, for humorous effect. The characters around this glowing, staggering Scot are descendants of the old Gillespie of mediaeval legend, stock characters, like the ubiquitous Scottish engineer from Paisley, turning up in the China Sea or in the Malay Straits, a blusterous, wise-cracking, tumultuous, lusty fellow who takes life frothily and spices it with pawky humor and a condiment of literary witticisms that the real Scottish engineer could never attain. This is the type that Frederick Niven handles so plastically.

To the second group belong all those men, with a growing feminine contingent, whose aim is to fashion something close to reality, recognizable, touched with humor it may be, and wistful with pathos, and even smothered in Lowland talk and possibly "having the Gaelic," but entirely credible, and not distorted deliberately for alien consumption.

There are, in this field, particular genre sketches that, in tone and warm color, recall those very domestic interiors of the Dutch school, and latterly of Josef Israels, whose interiors are sheer Scottish in feeling. "The Shepherd's Calendar," whose title L. MacPherson borrowed from Spencer, is no sprightly idyllic picture, although it is pastoral. It creates the story of a lonely sheep farm nestling in the Grampians, that bulwark against Roman aggression, and still a bulwark against modernism. Lewis Gibbon's "Sunset Song," bare of mechanized "plot," is also essentially chthonic, a paean, occasionally a dirge, to "hive and horse and herd," murmurous with the living tragic tones of the farmer's daughter, torn by filial duty and long-

Scanned with CamScanner

ing for self-realization. It is a piece of poetised prose in line with the livid pictures of Maarten Maartens, that Anglicized Hollander. Eric Linklater also takes a remote corner of the land, those fringing Orkney Islands that bend back to old Viking times. It is "White-Man's Saga," re-echoing with embattled contacts with the Scandinavian coast. "The Grey Coast," again, from Neil Gunn's pen, centres round the fishing industry, an old, tragic industry, as Pierre Loti well realized. "Janet Thurso" becomes more metropolitan in Edinburgh, burrowing in its streets hoary with mediaevalism. "All Smoke," a harsh tale beaten out toilsomely by an erstwhile truckman, weaves its violent, acidulous story around clamant Glasgow. Lennox Kerr also takes town life, in "Glenshiels," as the background for a sullen, authentic story of a Scottish family that disintegrates into dolorous ineffectiveness through parental tyranny. But there are other tales, more numerous, and on the whole more characteristic, where local color is secondary, as it should be, to the human drama playing and aching against its background. Such a one is "The Path of Glory," George Blake's war commentary. It is a searing, moving tale of a Highland boy in war, and, more, it is the tale of his love for the bagpipes, that maligned instrument. In fact, the bagpipes become the unspeaking, though not soundless, chorus, launching their throbbing, plangent notes in camp and on parade ground and lastly and remotely against the blazing agonies of Gallipoli. Even more Gaelic in flavor is James Barke's "The World His Pillow." It was Duncan Carmichael who, like Barrie's whimsical alter ego, set out southward, this time to Glasgow, to set the city aflame. But his contacts with the fringe of politics and office routine, and rather pedestrian encounters with The Bright Young Things (including Shaw), are transient in their effect. Like Rutilius Namatianus, Carmichael represents a Scottish "De Reditu Suo," finding in his native Glenaraig a microcosmos of all that he had spiritually and emotionally been seeking.

Maurice Walsh has touched things Scottish intimately with his "Key Above the Door" and "The Small Dark Man," while O. Douglas is producing sober things like "The Setons," "Penny Plain," and "Eliza for Common." Competing with these are Robert Craig, M. N. Goold, Janet Laing, Nan Shepherd and Claire Spencer.

It should be noted that in spite of the small area of Scotland itself, there is as great a variety of type and character and tradition as there is between the stolid Norman peasant and his more volatile compatriot of the Mid. Scotland can still utter the old Gaelic tongue that flourished before the turbulent Romans touched these shores. In its wrinkled Highland glens it lives a life secluded, remote, hieratic. The Lowlands, again, with their yellowing fields and sheep pastures shadowed by dour hills, is a land unto itself, while the east coast lives mainly with and from the sea. And in between these

vales and flooding streams lie roaming stretches of gorse, clustering mining villages, mill towns, crofters' parcels of land, and wilder, untrodden glens and brooding mountains.

And the novel, in psychic correspondence, travels up and down the land, probing out the nooks and dells and giving them visibility. You participate in the whirring mill towns, clanging with clogs, go marching forward to feel the bite and snap of the lashing east wind howling round Inverness and sweeping down most of all to Edinburgh. Go further afield to the Hebridean Isles and the glens of Argylleshire, where Bonnie Mary still dwells. Accompany Neil Gunn to "The Lost Glen," moist with Highland mists and wrapped in the yearning loneliness of swaying heather. Then enter into colloquy with David Donald's "Padam Aram." And throughout it all you will observe how tense Scottish life is, how peculiarly sundered it can be, how rich in scenes vividly alive, in variation of type, in adherence to old ways that are swiftly passing but are, happily, being impressed into literary permanence.

HIGH POINTS

Let's Build a Theatre

A Project Proposing to Interest Slow Students in Literature by Means of Appealing to their Manual Skills

Shortly after the beginning of last term, I summarized for my own information the few genuine interests of my students in a third-term repeaters' class in English. I was dismayed to realize that apart from an interest in athletics, they seemed to enjoy only shopwork, drawing and, in the case of girls, sewing. On the other hand, they profoundly disliked reading of any sort, and frankly admitted boredom with all school books. For students so mechanically minded, and so disinterested in books, how was I to make Shakespeare seem to them an interesting adventure? That was my problem.

The first day set aside for a consideration of "The Merchant of Venice," I contented myself merely with showing the class pictures and diagrams of different theatres. I hoped to interest the boys in the floor plans, and fortunately I succeeded. In fact, so interested did the boys become in the discussion on floor plans and diagrams that finally, when I showed them a number of good plans of a Shakespearian theatre, one of the boys enthusiastically asked, "Couldn't we work with these plans and make a model of a theatre from it?" Overjoyed at this response, I heartily approved the suggestion, and soon the boys were eagerly discussing possible ways and means of building such a model. They formed themselves into a committee and, at my suggestion, de-

Scanned with CamScanner

termined to consult a few books on the subject of the theatre in Shakespeare's day before beginning the actual work.

By now the girls in the class began to feel excluded from the work of the class. In order to join the enterprise, one of the girls suggested that a committee of girls be formed and that they apply their knowledge of sewing to costuming dolls which would represent the audience in the theatre and the characters on the stage of the model. Again I was delighted with their suggestion, and once more I urged a preliminary study to precede the actual work.

A few days later, the two committees announced that they were ready with some preliminary findings. The "Costume Committee" had secured from a public library excellent pictures of Elizabethan costumes. These were shown to the class and provoked a thoroughly interesting discussion of the various classes of people who lived during the Elizabethan Age. The "Theatre Committee" then reported, and their pictures and explanations provided another interesting twenty minutes of class discussion. I was greatly interested in some of the unusual bits of information the students in both committees had been able to secure for the enjoyment of their fellow students.

For the next seven weeks the class made little reference to their project, for all their work was to be done after school hours. That the work was progressing well, however, and that a splendid transfer of interest had been effected, was clearly indicated by the genuine enthusiasm displayed in class during the reading of our play, "The Merchant of Venice."

Finally the model and the dolls were finished, and the class begged to be permitted to give a Shakespearian program during which their work could be properly displayed. On a certain memorable Wednesday morning, my students presented a series of short, informal talks, a dramatization of the Casket Scene from the "Merchant of Venice"—for this scene was represented in miniature on the stage of the model—and, finally, a brief discussion of the methods employed in building the model. The program in full follows:

A Program on Shakespeare

One: Interesting Facts about Shakespeare's Day.

Two: The Theatre in Shakespeare's Day (with reference to the model).

Three: Costumes worn in the Elizabethan Era (with reference to the costumed dolls).

Four: The Life of Shakespeare.

Five: The Story of the "Merchant of Venice."

Six: A Dramatization of the "Casket Scene."

Seven: How We Built our Model.

At the conclusion of the program, the students presented the model to the English department. Now the theatre is on exhibition in the school library and is used from time to time by other classes studying the "Merchant of Venice." Thus the students who participated in the project feel they have accomplished something of permanent value, and have contributed something worthy to their beloved John Adams.

Whether or not these particular students continue to read Shakespeare is not so important as the fact that they have at last glimpsed the idea that reading can open to them a world of new knowledge and experience. Certainly their attitude to reading—one of indifference and scoffing—has radically changed. From all indications, this particular group of students is now firmly convinced that books can yield worth-while ideas, and can be pleasant and desirable companions.

In conclusion, I want to add a few comments upon the model itself. Since I had no part in the actual planning and construction of the theatre, I feel justified in giving it the praise it rightly deserves. It is a large wooden model, approximately three feet by two and three-quarters, painted attractively in gray and red, with touches of blue, gold and silver, and showing clearly every detail of the theatre of the Elizabethan Age. Such care has been taken that the pillars on the outer stage are fluted delicately, the pit is covered with gravel, and the back stage is artistically curtained off from the outer stage. The miniature stage set shows Bassanio about to make his choice of the three caskets in the presence of Portia and Nerissa. The Caskets are charmingly displayed on a diminutive table.

Curtis Carnival

Like other schools whose auditoriums were built a decade ago when styles ran to large Gothic halls, we of Curtis have had to limit our school get-togethers to eye-appealing performances like last year's George Washington pageant and this May's central European carnival. Perhaps a school hall like ours has its advantages: responsibility for good performances rests on the shoulders of several departments, and a large number of students make up the cast—this year more than two hundred.

White Pierrot-clad ushers with a Roxy drill welcomed the audience, and Bizet's *L'Arlesienne Suite* and the Glee Club's *Come to the Fair* made it ready for the first scene of gay booths in reds, oranges, and yellows against a gray back drape. Gradually the carnival crowd, in two's and three's, rivaling the booths in color, sauntered and skipped in from auditorium side aisles—mammas in voluminous purples, papas, balloon venders, sellers of seed-cake (or whatever central Europeans nibble during carnivals), loving couples communing with each other's eyes, oblivious of the world, especially of the *enfants terribles* who minced behind in exaggerated imitation.

The spotlight picked out a barker in royal purple and much gold braid who introduced the freaks—the bearded lady, the giant (our tallest boy on stilts), the fat lady, the snake charmer, and the human skeleton. Two girl clowns in leap-frog dance, gracefully grotesque, were followed by the company of pink-tighted acro-

Scanned with CamScanner

bats in black shorts who performed different groups of pyramid acts. As the applause for the lady acrobat dancer who followed them died away, the audience craned its neck toward the center aisle rear, where an Elizabethan camel came swaying, flanked in side aisles by bears, monkeys, lions and tigers whose muffled roars (orchestra drums) were realistically accompanied by rhythmic whip cracks of a mustachioed master of ceremonies and red-clad lady lion tamers.

The animals mounted their barrels for the dance of the lion tamers, a variation of the acrobatic dances. A bear game with medicine ball followed. The dance of the hairy camu-el, whose neck movement alone might have warranted the name of the Pacific Swells, was a good foil for the cocoa-brown monkeys who jumped through yellow paper hoops.

A medley of Russian gypsy songs opened scene two, a gypsy encampment, with a prophecy of a gypsy crone (the only speaking part besides the barker's and the gypsy father's) who foretold trouble and joy for the gypsy princess. A kettle on a tripod displaced one of the carnival booths; a lively card game the other. The handsome hero in sideburns smoked somberly near the wings as he watched the movements of the princess, then with a dramatic flip of his cigarette bowed at the feet of the fair lady, only to be forced to wrestle with the other suitor. A gypsy dance and the gypsy king's blessing finished the quaint marriage ceremony of tying together the hands of the bride and groom. The grand finale was Ca... *minia,* sung by the carnival folk who had dribbled in during the gypsy scene.

The performance might have been disjointed and incoherent had it not been for the coöperation of all concerned—the stenographic, the music, the physical education, the art, and the English departments. But the really remarkable thing about it all is that at a time when central Europe is being torn by bitter nationalistic hatreds and mediaeval race and religious prejudices, we in a school that consists of less than four thousand can get more than two hundred children, representing twenty-two nationalities, including Chinese and American Indian, to work and play so well together.

Curtis High School.

The Organization of Student Leaders in a Department of Health Education

The recent policy of the Board of Education in increasing the pupil-load of all teachers has given impetus to the more extensive use of student leaders as assistants to teachers of high school physical education.

Regardless of the extent of his training, no high school or college student is capable of filling the position of a regularly licensed teacher; nevertheless, as an emergency measure, we have found the utilization of trained student leaders to prove of great assistance in maintaining our complete activities program.

A trained student leader can be helpful in every one of the activity and service centers of the Department of Health Education, particularly in taking care of such routine matters as the checking of attendance and the dissemination of information regarding the program or procedure involved in any branch of the department. This is especially true of those students who assist in the service branch. The amount of training required therein is negligible; thus, the student of average intelligence who is selected as a leader in this branch can acquire sufficient knowledge from a list of standard practices and procedures that may be prepared by the chairman of the department or the teacher assigned as faculty adviser of student leaders. Of a more difficult nature, and certainly more important, is the assistance provided by student leaders in conducting a practice session in the recreational part of any period. Their correction of individual errors and demonstration of correct form during the group practice of skills previously taught in mass formation by the teacher, and their control of subsequent competitive games bulk large in the satisfaction, progress, and joy felt by the entire class. Furthermore, this indicates the need for thoroughness in the organization and training of student leaders in physical education.

The need for an organization of all student leaders of physical education activities within any large city high school is felt most keenly at the beginning and at the end of a school term. Particularly at these periods is the *esprit de corps* of the body of student leaders the only factor which will provide the inner urge for them to "carry on," in the most useful manner, despite difficulties. The newer schools are equipped with three gymnasia, two locker rooms, a swimming pool, and several athletic fields. Furthermore, with the tendency to overload classes so that a class of two hundred pupils is a common occurrence, the difficulties confronting the teacher who is obliged to work without trained student leaders becomes self-evident.

For the past few years, we at DeWitt Clinton High School have been experimenting with several plans of student leadership. We have reached the conclusion that the unification of the efforts of all student leaders in physical education activities at our school is highly desirable. We have merged our groups of leaders into an organization known as the Gym Leaders' Corps, providing insignia only to those members who are assigned to assist in the control and management of the activity areas in our physical education plant. The writer was given a special assignment as faculty adviser of the newly-formed organization, charged with the responsibility of supervising the training and performance of the leaders of the current term as well as the fundamental training of prospective leaders to fill vacancies anticipated by graduation and transfers.

In effecting the reorganization of the student leaders in our school, where each teacher had been selecting

Scanned with CamScanner

and training his own captains for many years, we conducted short examinations during the first week of the term. All students who claimed service records in the capacity of gym captains were required to demonstrate their efficiency in clerical duties and recreational skills. Only those who were successful in passing both parts of this special examination were retained to form the nucleus of the Gym Leaders' Corps. The most capable leaders were assigned as "ranking captains" to assist in the orientation of newly assigned leaders. Being confronted with a shortage of trained leaders, we then tested, during the next week, all students who possessed a good physical development and a desire to serve as leaders. The test was limited to the candidates' personal performances of the recreational exercises taught during the previous term. Those whose exhibitions were meritorious were given instruction in the clerical duties of a leader and then assigned to active duty in all the periods to which they were programmed for physical education. To fill the needs of most classes, we requested our veteran leaders to "donate" as many of their study periods as possible to actual service in the gymnasium. This solicitation met with their hearty response and soon we had an over-supply of leaders in many of our classes.

To avoid a recurrence of this oversupply in certain classes and a shortage in others, we secured permission to change the programs of student leaders. To avoid duplication and to simplify matters, we designed a loose-leaf card index to list the captains assigned to every class in each gymnasium. Of course we secured the coöperation of every teacher in the department. After a copy of the net registration in each physical education class was obtained from the chairman of our department, it was not a difficult matter to decide on the number of leaders to assign to that class. As a means of identification and introduction to their new teachers, all leaders were given an official assignment card which designated their detail to duty for definite classes. Only those leaders assigned to assist in the gymnasiums and playgrounds were required to attend bi-weekly meetings to discuss the problems confronting them and to obtain practice in the advanced program of activities that was scheduled for their near future. All other student leaders were chosen by means of a brief personality test and, since they were only to assist in the service bureaus, all instructions were furnished by the distribution of mimeographed bulletins.

The setting of high standards and the use of insignia helped to develop a fine *esprit de corps* in the Gym Leaders' Corps. The rapid development of many of the inexperienced leaders was in a large measure due to the sense of responsibility assumed by the veteran leaders designated as ranking captains. A student who was new to the position of a leader was easily bewildered by the many demands of his position. The steadying influence and assistance of these veterans, however, soon helped the new leaders to orientate themselves. In addition, their daily experience helped them to acquire a quiet, rapid, efficient style in the execution of their duties. Before many weeks had passed, we had developed an organization of which the school was justly proud. To carry over this pioneer work to the succeeding term, we adopted the following procedure.

Two weeks before the end of the term we posted an alphabetical list of student leaders whose performances warranted re-appointment for the new school year. This list contained transfers and promotions in rank deemed essential by the anticipated graduation of some of the veteran leaders. Instructions regarding general procedures during the opening weeks of the new term were appended to this list. The faculty adviser of the Gym Leaders' Corps was relieved of his regular program in order that he might complete the organization for the new term. During the first week of the new term the leaders who were to assist in the Service Bureaus, such as those of the locker rooms and departmental officers, were re-assigned according to their new programs. The leaders who were scheduled to assist in the Activities Bureaus made themselves generally useful in the gymnasiums while awaiting definite assignment to physical education classes during the second week of the term when, guided by the requirements as to the number of students registered, the faculty adviser made definite assignments for the new term.

The fact that the performance of all student leaders was expected to be at or near "concert pitch" for the entire forty weeks of the school yaer, made it essential that provision be made for humanizing a large organization.

Cognizant of the progression in the physical education curriculum of the school, the faculty adviser of the Gym Leaders' Corps was obliged to work as as coördinating agent, coöperating with the teachers in charge of each phase of the program and simultaneously serving as a sympathetic adviser of a large body of students in order to maintain their morale.

Despite the practices, in smaller cities, of the democratic election and rotation of student leaders, we have adopted contrary policies in our school on account of variable conditions whereby the students are programmed for physical education. Rarely did more than five boys from the same home room (sometimes known as the official section room) meet in physical education classes. Election by students who were unacquainted with each other was therefore not feasible. Another factor of not inconsequential nature was that the practice of alternating as leader and follower in large classes did not function as well as the practice of having permanent leaders for the entire term. These factors led to the formation of the policy of selecting all leaders and the resultant thorough organization of them as a quasi-administrative arm of the department of Physical Education.

Scanned with CamScanner

In this manner, the harnessing of a veritable Niagara of power in the form of whole-hearted assistance by students was accomplished by the functional-unit organization of all student leaders serving in the multifarious branches of our department. Furthermore, we avoided over-lapping instructions from different teachers, thus enhancing the efficacy of these student assistants.

This principle of organization was likewise used to consolidate the work of leaders in the field of intra-mural athletics. We are convinced that we have taken one of the most progressive steps in the field of modern physical education through the thorough organization and subsequent smooth functioning of our Gym Leaders' Corps.

JACOB J. BALLAS.
DeWitt Clinton High School.

A New Approach to the Appreciation of Architecture

Architecture must be thought of in three dimensions. The making of architectural designs on paper, without an experience in building in three dimensions, was unsatisfactory. It seemed necessary to give an awareness and realization of the volume of a building.

Modern architecture was studied by means of photographs, and after a discussion of the factors which influenced architecture it was decided that the materials, zoning laws, and use or function of the buildings showed that the shape of these buildings varied according to the use of the building. A helpful book to stimulate the imagination was found in "The Metropolis of the Future," by Hugh Ferris.

It was then decided to build the model with blocks. These had been ordered from the supply department. Three large packing cases of cubes, plinths, cylinders, and the like, were brought in. The class was divided into six groups of seven pupils each. Each group chose a captain and after discussion decided on a type of building. Buildings chosen were a theatre, science laboratories, railroad station, apartment house, business building, monument. Each member of the group contributed his ideas, and then under the direction of the captain building was started. At first, only the front side of the building was thought of, but it was found that all sides must be considered. Then the volume of the building must be planned. It was interesting to observe how naturally each point developed.

One group was too individualistic and the period passed with no result, while the other groups completed their buildings. It was interesting to see how once when the pupils of this group realized their fault, they made a very good building the next day.

The finished buildings were photographed. The next day, elevations were drawn from the buildings. The understanding of an "elevation" and "façade," was secured with no difficulty.

During the building with blocks, a small number of pupils had said, "If we only had more shapes and sizes of blocks we could make a much better building!" Other pupils had ideas of their own which could not be worked out.

The following lesson was an original design for the elevation of a modern building, with emphasis on use, proportion, spacing and variety. Light and dark were also considered. In this problem each had an opportunity to use his imagination and creative ability.

This series of lessons had worthwhile results. First, it brought a realization of three dimensions in architecture. One little girl said, "I never realized before that you had to think of four sides of a building." It emphasized the large relationships of the masses, and the light and dark effect of those masses. It gave a chance to experiment with changes of position, size and volume. It had value as an experience in group work. The original designs were much better than those which had been obtained before.

They all understood the elevations without difficulty. It helped materially in "Appreciation of Architecture."

I feel that the experiment was well worth while and had very helpful results.

CATHERINE LANCASTER.

The Relation of Dress to Personality

Our appearance has a three-fold effect, first on the observing public, then on the more intimate circle in which we move, and lastly, on ourselves.

Business and professional people admit that a person dressed in good taste will have a better chance than one who is unbecomingly dressed or careless in appearance.

We owe it to our family and to the inner circle of our acquaintance to be pleasing in appearance. The effect upon ourselves has a reassuring value as we are more or less clothes-conscious and our appearance has a great deal to do with our sense of repose or poise of manner.

If "personality includes all those peculiar powers that make up the individual," then an outstanding factor in a pleasing personality is one's personal appearance. Therefore, the subject of clothing should be a deliberate study rather than a haphazard one, or a kind of indifferent indulgence in fads or fancies of the hour.

Dress is a fitting background to personality (as a frame is to a picture), while the graces of the spirit, charm and refinement can only be the product of a beautiful mind.

Manners that denote sincerity and cordiality, with forms of expression that reveal true politeness are habits which, by custom and usage become parts of ourselves and enhance our personalities.

George Herbert has wisely said, "By all means, use some time to be alone, salute thyself; see what thy soul doth wear. Dare to look into the chest, for 'tis thine own, and tumble up and down what thou findest there."

While the art of good dressing is a medium of self-expression, it should

Scanned with CamScanner

never be emphasized to the exclusion of the finer qualities that make up a charming woman. While clothes *can* portray character, it is only when such garments express the wearer's ideas that they become individual.

We want to be able to judge quality and the suitability of fabrics in their relation to other things to buy the best for the money, and then to know how to take proper care, to repair if necessary, and to renovate at will.

When we think of textile values, we think of the quality, beauty, color, durability and comfort which each textile will give. In order to purchase wisely we must know how fabrics are manufactured in order to distinguish the real product from the artificial.

How to make good selections in clothing and home furnishings, how to develop the right attitude toward our responsibilities, how to manipulate tools, how to adapt the principles of color, how to construct a garment in an intelligent way, is the purpose of the Course in Clothing.

A girl must consider her health if she wants to be beautiful. Correct posture, a balanced diet, hours of sleep and exercise will (if consistently carried out) contribute to physical well-being.

To be able to discipline one's self is to increase vitality and thus enhance our powers.

Costumes change with time and eras, but there are certain established conventions which can be adjusted to our own individual needs and for all occasions.

Clothes that are planned to suit a woman's coloring, hair, eyes, skin, contour of figure and age have a quality of appropriateness which gives to her a social and economic standing.

The demands of modern life are creating new ideas for comfortable dress. Garments that will stand the strain of wear and contribute to the health and efficiency of the wearer are demanded by a great number of women who are able to earn outside of the home. Articles that are simply made, convenient for laundry purposes, and easily adjusted are recommended for daily wear.

Shoes should fit without strain. Hats should be light and becoming and the accessories of dress, such as jewelry, belts and neckwear, must be used with discretion, as an over-decorated appearance falls short of adornment.

The value of good grooming brings out the best in appearance and personality. Well-cared-for hair, skin and hands contribute to a feeling of assurance and respect.

While fashion dictates style, we can select colors, materials and patterns which suit our particular type and so set a standard which (if in good taste) will meet the approval of the present day stylist.

Patterns come in a wide variety of styles to suit every figure. The meticulous care which the leading fashion companies have used in issuing instruction sheets with every pattern, makes dressmaking today a joy and genuine satisfaction.

Whether we make a garment for the sheer pleasure of it, or whether we desire to effect economy, some fundamental rules of needlecraft, cutting, fitting and finishing must be understood and faithfully carried out in order to preserve the harmony of the ensemble.

The Course in Clothing offers our girls the knowledge that will help them to ascertain values, to recognize texture in materials, to be economical in buying, to be well-dressed and to be independent, whether they are to assume the responsibilities of a home, or in business. They will learn to relate facts, appreciate values, plan their budget, and to develop powers of judgment as well as a spirit of investigation.

Julia Richman High School.

Opportunities and Awards in Mathematics at Alexander Hamilton High School

At Alexander Hamilton High School there are many opportunities for the talented pupil to do work in mathematics that is far beyond the requirements of the regular syllabus. There are some group activities of an advanced nature, and other activities which require individual work and study. In addition, several awards are available for outstanding achievements in the classroom and out.

The two organizations devoted to the extra-curricular study of mathematics are the Mathematics Club and the Geometry Circle. The latter, as the name implies, is concerned primarily with the study of geometry, while the former spends most of its time in the field of algebra. At the meetings of these clubs, discussions are held on topics more advanced than those regularly studied and the usual classroom subjects receive a more intensive treatment. Topics such as the cases of factoring, now omitted from the curriculum, the u-v method of solving quadratic equations, finding the square root of a binomial surd, letter multiplication and division, and puzzle problems of the "Sam Lloyd" type are taken up by the Mathematics Club. At the meetings of the Geometry Circle some of the subjects presented are the nine point circle, the Euler line, homeoethetic figures, fallacies, and Ceva's theorem. Life histories of great mathematicians also appear on the programs of both societies. The clubs, furthermore, discuss topics not required by the Board of Regents, but which are demanded by the College Entrance Examination Board. In this way the boys are able to keep in touch with mathematics even if they are not enrolled in some mathematics course. At the same time they can prepare themselves for College Entrance Examinations should they desire to do so.

Another function of the Mathematics Club is to develop candidates for the Mathematics Team which participates in the Inter-Scholastic Algebra Contests. The members of the team are selected by daily contests among the members of the Club. A weekly meeting, however, is devoted to work which is not intended as a special preparation for mathematics contests.

Scanned with CamScanner

Another mathematical activity conducted at the Alexander Hamilton High School for the benefit of the bright student is the publication of a paper called the *Hamilton Trigon*. In this paper, a four-page magazine, there is ample opportunity for the ambitious pupil with a literary bent to express himself. Here the boys have a chance to write up any interesting current mathematical news, historical outlines, biographical sketches, opinions on controversial mathematical questions, problems and puzzles, or any topic relating to mathematics. The *Trigon*, printed twice a term and sold for five cents a copy, receives the support of the mathematics student body.

A semi-annual activity which arouses a great deal of enthusiasm among the boys is an algebra contest. This match, which is open to the entire student body, is an elimination contest conducted in the following manner: The examples or problems are written on the board and a time limit is set for each exercise. The answers are marked after each example. Contestants are eliminated after getting five examples wrong. The three who last the longest receive gold, silver and bronze medals respectively.

Besides the medals given to the successful competitors in the Algebra Contest, there are several other awards for excellent work in Mathematics. The *Hamilton Trigon* prints the names of those students who received 100% in the Regents' Examination and presents each of them with a certificate of merit. To the seniors who have actively participated in the work of either one of the mathematics clubs, the General Organization of the school awards certificates of service. The graduating members of the mathematics team receive, in addition, a book on some phase of mathematics. The Geometry Circle, too, offers three medals, gold, silver, and bronze, to the three members doing the best work in this organization. To the graduate whose work in mathematics and science has been outstanding, the Rensallear Medal for achievement in mathematics and science is presented.

The most coveted prize of all is a gold watch offered to the senior, at commencement, for excellence in Mathematics. This prize is based upon marks received in regular mathematics courses, participation in extra-curricular activities, and a comprehensive examination which includes such topics as the history of mathematics, analytic geometry and differential calculus. In preparation for this examination, the candidates must do a great deal of studying in these topics by themselves. This watch is given by one of the school's organizations, the Bookroom Club, which is under the guidance of the chairman of the Mathematics department. The senior receiving the prize also has his name engraved upon the School Honor Roll, which is likewise provided by the Bookroom Club. A second prize of a gold medal is presented by one of the alumni to the second best graduate.

It is evident from the above outline of activities in the field of mathematics that no student at Alexander Hamilton High School who shows a greater ability than the average need suffer from the lack of opportunities in which to develop his mathematical proclivities.

AARON SHAPIRO.

Alexander Hamilton High School.

The First Lesson in a Beginners' German Course

The question of what to do with a first term German class on the first day of school has occupied the minds of many teachers, especially of tyros! Our attempt here is not to formalize a routine to be imitated by others but to outline a method which was used effectively by the writer and which may serve to help others.

German suffers from a tradition which it is difficult to break down, namely, students believe that it is "even harder than Latin" and that nothing short of superhuman effort can give appreciable results. In order to restore confidence in these students it was found efficacious to challenge the class with the question: "Who thinks he does not know any German?" Most pupils are modest enough to admit that they do not and thus an opportunity presents itself to the teacher to show the students how much they really know. This challenge is a good form of motivation and the class is ready for action. The teacher then reads and places on the board sentences like these:

Der Ring ist von Gold.
Das Nest ist warm.
Der Wanderer hat ein Horn.
Die butter ist bitter.
Die Hand hat fünf Finger.
Der Winter ist kalt.

When asked for the meaning of these, which they readily knew, their faces beam with joy and the barrier of fear has been lowered. When, in addition, the teacher writes these sentences on the blackboard and the students behold that German uses the same form of writing as the English (and not script) then the barrier is completely broken down and German becomes a subject which can be studied, mastered, and enjoyed like any other. Having established confidence a good question is: "Why do we study German?" Various answers will be given by the students such as the following:

A knowledge of German helps us in a better understanding of English.

A knowledge of German aids us in studying medicine, higher mathematics, chemistry, and the like.

It is an asset for those who travel.

These and other answers will be easily elicited, but the direct answer will perhaps not be obtained. It will therefore fall upon the teacher to explain that the aim, above all, is to bring about an understanding of the institutions, the habits, and customs of the people speaking the language and a realization that each nation has different customs and traditions which we must understand if we are to bring the much desired brotherhood of mankind nearer to reality.

Through a concrete example the teacher can clinch the point. He may tell the class that Americans in Germany are stupefied by the fact that during the long intermissions in the theatre the German people suddenly

Scanned with CamScanner

produce packages, boxes, and bags out of which they bring forth food which they devour heartily. To the American such behavior is uncouth. The teacher's explanation will reveal that it is only natural to these people for in Germany places of business are closed between twelve and two since the German loves his Gemütlichkeit. This extra time is made up by closing these places later at night. If a German who loves the theatre wishes to see a performance he must go there directly after business since the theatres open earlier than they do in the United States. Every country has customs peculiar to itself and the teacher may cite the example of the Chinese who shake their own hands because it is unsanitary to shake the hands of others.

A fine procedure after this is to hand out outline maps of Germany and perhaps give an idea of its size, boundaries, and reasons for its importance.

If time permits the German alphabet may be presented to the class in this manner:

A, B, C, D, E, F, G,
H, I, J, K, L, M, N, O, P,
Q, R, S, T, U, V, W,
X, Y, Z.

BARUCH SCHACHTER.
George Washington High School.

An Experiment in Class Journalism

Probably the most effective way of teaching composition is by the project method; probably the most vitalized project is the class newspaper. The writer achieved such gratifying results by means of this device last semester that he feels impelled to describe it, in the hope that it may be of some benefit to those teachers who, while realizing the value of the project method, are getting somewhat weary of class books on such startling subjects as "The Home Beautiful."

This particular experiment had a most auspicious beginning, for the desire for it came directly from the students. A few remarks about what they *might* do, if they were really interested, served to spread the enthusiasm until nine-tenths of the class were as eager to be on the staff as the boy who suggested the idea.

A period was spent in organization. The class submitted suggestions for the name of the paper, which was selected by a majority vote. Then a staff was elected consisting of an editor-in-chief, two associate editors, a boys' sports editor, a girls' sports editor, a humor editor, an art editor, and two typists. Every remaining member of the class was to consider himself a reporter. Students who belong to clubs (and nearly every one belonged to at least one) were asked to cover those activities for each issue. It was decided that the paper would be published bi-weekly.

Then arose the question, what are we going to write about in the paper? Some were in favor of making it strictly a class paper and limiting it to news of the class, but it was finally decided, after much vigorous discussion, to include all news of the school. In addition to news, the class decided the paper must have a page of humor. Further than that, their plans were vague. There was talk of poetry and stories, and one student even suggested a serial story. The writer, wishing to make it an all-student affair, refrained from making additional suggestions, hoping that the paper would grow in the hands of the students.

The first issue was a slim affair, consisting of four sheets. On the first page appeared an editorial and various news articles. Page two contained club reports; page three was the sport page, and the last sheet was covered by a full-page cartoon, the contribution of the art editor. In appearance, issue No. 1 was quite mediocre. It was typed in one column (right across the page), and it had headings, or titles, rather than headlines. It had a top title sheet, so that, in fact, it resembled a magazine more than a newspaper.

The issue was read to the class in its entirety by the editor-in-chief. (Later issues were read only in part, for lack of time, since they were increasingly bulky, and then posted on the bulletin board in the English room where all had free access to them.) Suggestions were then in order for the improvement of the "sheet." These came in great abundance from the eager students.

It might be interesting to note that, upon the appearance of the first issue on the bulletin board, the contagion for a class newspaper spread to the remaining four classes (all second year) taught by the writer. The result was that soon five class newspapers fluttered gaily from the bulletin boards of the English room.

The growth of these class papers was indeed remarkable. The first issues were very plain and hardly worthy of mention; the last issues were such fine pieces of work that they called forth much comment and praise when they were displayed at the annual convention of the New York City Association of Teachers of English. In every issue changes were made and new features added. For instance, the students very soon decided to discard the top sheet and to make their bulletin more like a real newspaper by having the name right at the top of the first news page; with this same view in mind, the editor laid out his paper in three column form, instead of writing across the page. Soon the idea of real headlines arose, and from the one column head to the three column streamer was but a step.

In about the third issue an ingenious editor obtained a Photomaton picture of the newly elected G. O. President and from then on photographs of all kinds were regular features. These were pasted on the pages of the newspaper.

Each issue saw the papers expanded. Soon there was a page devoted to *Movie Reviews;* another was headed *Book Corner;* still another *Tuning in,* and so on. From insignificant four-page issues these newspapers grew to issues of twenty and thirty pages. And what is more remarkable, they came out *regularly* every two weeks. That was the true test of their worth;

Scanned with CamScanner

it is comparatively simple to get out one issue, but a different matter to publish nine issues in one term.

One of the reasons the issues often attained such bulk was that the columns of the class newspapers were used for publishing such class themes and other written work as merited the distinction. The motivation thus provided resulted in much improved composition work. Another reason for the growth of the newspaper was that the various editorial staffs were encouraged to imitate the good features of the others. Thus, five editorial boards being better than one, there soon appeared such features as serial stories, hobby pages (including a very interesting display of stamps in one issue), mathematical riddles, question and answer page, a Dame Gossip column, The Inquiring Reporter, Poetry Page, Short Story Contest, What Teachers Think, Fashion Page, Class Knocks, Tin Types (à la Skolsky) of Class Personalities, and others which their endless ingenuity devised.

The art editors had ample opportunity for fine work. In addition to making the heading, lettering the headlines, planning the lay-out, they embellished the various issues by writing appropriate marginal decoration. Thus, the Christmas issue was all holly and ivy, while the final issue was decorated with bespectacled students weeping tears of farewell.

The competitive spirit served as an impetus to better and bigger newspapers. Each class would read the pages of every other class, and they would vie with one another for scoops; very often the school newspaper itself was scooped.

While nearly every student in the class did some work for the class newspaper (even if it were only typing), the most gratifying feature (to the writer, at least) of the whole affair was that the project provided unusual opportunities for the more gifted students whose talents are ordinarily neglected in the rush of things.

JESSE GRUMMETTE.

Abraham Lincoln High School.

Group Testing at the Abraham Lincoln High School from February, 1932, to February, 1933

The Otis Self-Administering Test, Higher Form, was given to our students in February, 1932, and again to different pupils in November, 1932. The first test was given to pupils in terms one through four, or to 3221 pupils, including those in the Annex. In the second term (as will be the case in future terms) the test was limited to new entrants in the Main building, or to 653 pupils. Our school median in February, 1932, was 96 I. Q., in November it was 97 I. Q. We are trying to establish age norms for our school, and also percentile ratings, but the results of several years of testing will be needed for that. Our lowest quartile in February, 1932, reached from 67 to 87 I. Q., in November from 74 to 90 I. Q. In each case, the I. Q., name of the test and the date were entered on the back of the Permanent Record sheet.

I made a separate list of all the boys and girls who received below 80 I. Q. on the test given in February. In November, 1932, I followed the same procedure, extending the list to 85 I. Q. as the entire group tested was smaller.

I sent duplicates of these lists to all grade advisers and deans, suggesting that these pupils be interviewed after each marking period.

With this list of names, were sent the following notes:

COPY OF A REPORT SENT OUT AFTER THE FIRST TERM'S TESTING

The Otis Intelligence Test, Higher Examination, Form B, was given to the first four terms on February 17, 1932. The Intelligence Quotient has been entered on the back of the Permanent Record. The following is Terman's Classification:

I. Q. Classification

Above 140	"near" genius or genius
120-140	very superior intelligence
110-120	superior intelligence
90-110	normal or average intelligence
80-90	dullness, rarely feeblemindedness
70-80	borderline deficiency, sometimes classifiable as dullness, often as feeblemindedness
Below 70	definite feeblemindedness

The Intelligence Quotient resulting from a group test is no infallible indication of mental ability, but it is a good check on the teacher's judgment and the pupil's scholarship record. It is to be used as an additional bit of information about the student, to help us in guiding him, but it never gives a complete picture of an individual.

How to Use It

For Low I. Q. Pupils in

1. Giving limited programs to pupils below 80 I. Q.
2. Referring pupils to teacher of vocational guidance.
3. Giving differentiated programs which take cognizance of manual or artistic excellence.
4. Transferring to trade or other schools where adaptation may be more successful.
5. Adding emphasis in discussion with parent that course of study should be changed or that the hope of college entrance is ill founded.
6. Urging extra-curricular activities.
7. Special grouping for repeaters and different courses and texts for them.
8. Special prefect and subject groups for pupils on suspense register while they are looking for jobs.
9. Placing in special schools or institutions for atypical children.
10. Decreasing truancy and retardation by individual attention to needs of pupil.
11. Referring special cases of truancy, or retardation, or emotional block to Mental Office for individual psychological tests, home visits, physical examination, and psychiatric treatment, where necessary.

Scanned with CamScanner

For High I. Q. Pupils in

1. Giving permission for graduation in less than four years.
2. Giving special program privileges in individual cases and recognition of talent.
3. Urging entrance into honor societies of school and competition for medals, awards, and college scholarships.
4. Urging failing students with high I. Q.'s to reach their true level of accomplishment and investigating causes of previous failure. This may necessitate a close scrutiny of relationship with teachers, home conditions, physical disabilities, emotional disturbances, etc.
5. Enriching curriculum by special courses, such as Journalism, Play Writing, etc., and clubs for pupils with special abilities.

At the end of the term, in June, 1932, I took out the requested new program cards of these low I. Q. pupils, and with the aid of the dean and grade adviser made out a program for each student that we thought he could carry with some success. In some cases, we limited the number of major subjects to three; for some we added electives such as Shop, Printing, Art Weaving, Sewing, Cooking, Typewriting, etc. We followed the same procedure in January, 1933, making special programs for the low I. Q. group resulting from the November tests.

The group tests were given after the students had attended school for about a month, so that the nervousness arising from a test in a totally unfamiliar environment would be avoided. The test was given in the English room by the English teacher who had been given a manual of instructions and a sample of the test several days before. All scoring was done in the Student Welfare Office by a very small group of teachers and pupils.

For the pupils of high intelligence, we tried to do the following: The deans and grade advisers received a list of those who had attained 120 I. Q. and above, so they could see whether these students had achieved the distinction of being in Honor Classes, or the Arista, or were working on school publications or the like. If a pupil on this list had not become affiliated with any such group, the dean or adviser called for an interview, during which the pupil was informed of awards, scholarships, etc., which he might easily attain if he exerted himself to the extent we knew he was capable of. This term we are interviewing all high I. Q. pupils (those above 120) and sending them to the Vocational Counselor for advice early in their school career.

At the end of the term, where a great discrepancy was noted between the I. Q. and the scholastic achievement, the pupil was interviewed and either retested with a different form of the same test or given the individual Binet-Simon examination.

After consulting the term's achievement, the I. Q. and other records such as that of absence, health, and the like, we have within the year adjusted and modified the programs of about 300 low I. Q. pupils. In each case the Program Committee honored all requests coming from the Student Welfare Office, and no matter how varied the programs were, showed the greatest coöperation and a sincere desire to make the program of a large school as flexible as possible.

Our deans and grade advisers have had many occasions to use the information on the I. Q. of a pupil, and have grown very familiar with these pupils on either the low or high I. Q. Lists. Many of the pupils interviewed later transferred, with the consent of their parents, to technical or industrial high schools, and have written to us of their gratification and pleasure in the new vocation they have selected. This transfer of pupils is a direct outcome of our group tests, as the advisers had had several interviews with the pupils thus brought to their attention.

Most of the pupils on the low I. Q. level stay with us because of economic difficulties, but with a carefully limited program suited to their individual needs, they may, if regular in attendance and persevering in their efforts, sustain themselves for a period of several years without the feeling of failure and defeat they might otherwise have suffered.

MOLLY TULCHIN.
Abraham Lincoln High School.

Flying at Bushwick

Harnessing interest in an after-school activity is often rewarded by an overwhelming student enthusiasm. The student who is apparently a scholastic loss has some "high point" in his make-up. The teacher fortunate enough to discover this outstanding quality may be further rewarded by the satisfaction of the carry-over of this interest into other subjects. The Aviation Club at Bushwick is achieving success in such correlation.

Aviation has magnetic attraction and is adaptable as an extra-curricular activity. The club members are of widely varying grades and intelligence. The organization is run on a purely democratic basis—the presiding officers having complete charge. The results of popular choice were not very encouraging at the outset to the club's adviser, owing to the fact that the "best" were not chosen. The great surprise came, however, when these officers became conscious of the responsibility of their respective offices. They responded in a truly business-like manner. The necessity for good diction and clear thinking became obvious to them. This led to outside preparation of short talks on the history and technique of aircraft.

The club's chief activity is model building, which is conducted after the short business of the regular bi-weekly meetings. Members supply most of their own materials and build models only after they have acquired the groundwork and theory in the principles of flight. Practically all of these models are of original design with the exception of the scale models which are replicas of real aircraft. Self-initiated visits to aircraft factories and airports have provided

Scanned with CamScanner

additional interest. The outstanding event of the semester is a contest in which all members may enter their best models. Prize models are put on exhibition in the trophy case in the school corridor.

Recently the club prepared the program for one of the school's assemblies. Short talks on various phases of aviation were given by five of its members. Then several flight demonstrations of various types of aircraft were made. The assembly as a whole was a very lively and enthusiastic one, each exhibit and flight having been roundly applauded by the audience.

The club is now completing its fifth term of activity. Some of the older members, now graduated or out of school, are in the aviation industry or in professional aviation schools.

MARTIN KRAMER.

Bushwick High School.

Winding Up the Term in a Publication Office

With the commencement of the new term, the work of the faculty adviser of student publications begins anew. Regardless of the fine and efficient system developed during the previous term the entire structure is to be rebuilt the following term. Because the faculty adviser is not a full-time publications worker, and because very often the faculty adviser has other assignments at the beginning of the term, many things arise at that time which are of necessity postponed. This postponement in turn occupies subsequent time and thus overcrowds the schedule.

With a view to expediting matters, the forward looking faculty adviser will realize that certain matters can be done prior to the commencement of the term.

Instead of sitting back and availing himself of a well-deserved rest from a strenuous term's activities, the adviser can spend the last week or two of the term planning and preparing for the following term. The sooner he starts the new term's activities, the prompter will be the response of the staff and of the student body. Activity breeds activity. When the staff sees an indolent faculty adviser they react similarly. When they behold, however, an active and energetic faculty adviser they realize that they have to be fast-moving to keep pace with him. Furthermore, certain activities cannot wait for the opening of the term. These call for attention at the earliest possible moment. The most propitious time for such work would be when the "last issue is off the press."

In schools where the G.O. has its own membership campaign, where the athletic activities try to sell season tickets independently of the G. O., and where the several other activities have to fight their way and compete with one another, the publications office (which very often is nothing more than what the faculty adviser wants to make of it) will find it of advantage to be ready to start the campaign the very first day of the term, to "get the jump of the other activities."

With this in mind, the undersigned has prepared for himself a "check list" of things to be done by him before he leaves for the summer vacation so that when the new term starts he will be in readiness for another busy season. He is submitting them for the possible service these suggestions may render to other individuals similarly situated.

1. Secure applications for placement on the Publication Staff. Prepare and hold examinations for placement on Publication Staff.
2. Send follow-up letters to delinquent advertisers who haven't paid their bills.
3. Bills to advertisers.
4. Preparation of list of Publication Staff members entitled to awards for having rendered exceptional services.
5. Preparation of list of class representatives entitled to awards for having secured the highest percentage of subscriptions in the school.
6. Preparation of Commendation Cards to staff members for excellence in Publications.
7. Note to English Teachers requesting from them names of good writers and also some commendable manuscripts received during the term in the course of the regular work in English.
8. Mimeograph all Publications forms:
   a. Instructions to Class Publication Representatives.
   b. Instructions to Circulation Staff.
   c. Instructions to News Writers.
   d. Questionnaire to teachers concerning extra-curricular activities in their charge.
   e. Advertisement insertion orders.
   f. Petty cash vouchers.
   g. Summary of cash receipts for the day.
   h. Notification of acceptance of manuscripts submitted for magazine.
   i. Rejection notice.
   j. Staff meeting notice.
9. Preparation of a letter to be sent to potential magazine writers concerning their writing between terms for the coming issue.
10. Preparation of calendar for coming term.
11. Tentative appointments to the staff for the coming term.
12. Note to staff members concerning their programming for the coming term.
13. Meeting new members and assignment of feature articles for the coming term.
14. Preparation of a list of advertising prospects and distributing them to advertising staff for work between terms.
15. Call in class "pay cards."
16. Call for class Publications representatives and have them close their accounts.
17. Notify office of names of delinquent subscribers so that any person owing money to Publi-

Scanned with CamScanner

cations is not discharged from the school.

18. Secure a transcript from the G. O. treasurer of funds sent to him in the course of the term and compare with records of the Publications Business Manager.
19. Prepare a report for the term's activities.
20. Have all desks and closets cleaned.
21. Work up a "morgue."

I. DAVID SATLOW.

Bushwick High School.

A La Carte

In the *Atlantic Monthly* some years ago appeared an essay called "Straining at the Tether." The author observed, as he was sitting on a gentle hillside overlooking the glorious Bermuda waters, "Surely it is very odd that every goat in sight is straining at its tether. The grass is fresh and toothsome, and none is fastened in a bare spot; there are no bare spots. Why should they do this thing? Yet every goat is straining at its tether."

This picture has often recurred to me as I marveled at the restless energy of the young people who in recent years have come under my supervision. They have such an abundance of opportunity, comfortable, attractive classrooms, the very best of modern text-books and equipment, all the culture of the past offered in a far more pleasing form than a quarter of a century ago, yet they are unhappy, bored, indolent, constantly seeking an outlet from the monotony of their existence. "The grass is fresh and toothsome. There are no bare spots. Yet every goat is straining at its tether."

Because of this situation, and frankly, because I too occasionally strain at the tether against a routine sameness, I like to vary my methods of presentation in my English classes from term to term.

Someone has said that "a schoolboy is a person who can tell everything in the order in which he learned it," and that this is the lowest form of association. This definition is applicable to a vast majority, and it is in an effort to offset this mechanical tendency that varied devices have been used in my English classes.

The first term offers a fertile field for experimentation because the boys and girls welcome new projects so wholeheartedly that other ideas just naturally spring into being over night. The aims of all these experiments—to establish habits of accuracy, clear thinking, and initiative, to stimulate originality and to foster leadership—are such obvious objectives that it is scarcely necessary to mention them, but underlying all the devices used were one or more of these fundamental aims.

All young people delight in games. That is a self-evident fact, so, when a group reacts lethargically to spelling, my favorite device is an automobile race. This game is not original, but one that I observed when visiting a New Jersey teacher. The class is divided into two groups. The best speller from each group acts as chauffeur, and he selects a name for the racing car. The names of the competing cars are placed on the board. Then four passengers from each group go to the board, write simultaneously each word that is dictated, then return promptly to their places. No changes or erasures are permitted. The chauffeurs, with my help, check the words, for every correct word five miles are credited to the car's record. For a side totalling one hundred per cent, a bonus of fifty miles is added. This game is always enthusiastically received.

Another method of stimulating interest in spelling is to have anagram races. One row at a time is given this privilege. Each pupil has a set of anagrams which I purchased at the ten cent store. They race to see how many words listed in the English Handbook they can make in twenty minutes. A leader acts as inspector and keeps a record. This game is permitted as an award to the row scoring highest on a written test. It promotes quickness and accuracy.

Written descriptions are frequently boring and inexact, and, when descriptions are read in class, very few except the teacher listen attentively unless some unexpected stimulus is applied. Desire to eradicate this general indifference led to the introduction of a game called "Can You Guess?" Descriptions were written and read, and the class had to guess the object described. We found it stimulating and amusing. The following is one written by a first-term pupil:

Its face is like a plate; its hands are very thin.
It tells you when to come to school and when your work begins.
To me it's always smiling. How does it seem to you?
I'm sure you all agree with me when duty comes to view.
For instance in the morning, when it's time to go to school,
Do you always greet it as you should or greet it as a tool,
Do you turn it down upon its face to stop its noisy bell?
If you can't guess what this is, I'm sure I'll not tell.

Literature, like composition, tends to monotony at times and needs variety in presentation.

"Treasure Island" always has its appeal to young people, but so many of them have made its acquaintance before coming to high school that they are apt to rely on their previous and sometimes hazy knowledge unless it is approached from some new angle. About the most enjoyable term that I can recall was a year and a half ago when an enthusiastic little group organized themselves into a band of pirates and adopted names suitable to their bloodthirsty calling. The band consisted of such members as Blackheart McGinty, Terrible Dick, Murder and Death, and Cutlass Kate. They decided to live on an island, so hurriedly transformed the classroom into one to suit their fancy. Due to lack of space, a tent was substituted for the blockhouse, but it was well guarded at all times by a stockade and by a sentinel, John Silver, carved realistically out of wood and stationed at the entrance to the tent. Skulls were scattered freely around the stock-

Scanned with CamScanner

ade, and bones made from wood and painted hung from the molding. Guns, of all sizes and varieties, and the inevitable daggers were there. Even a tree, on whose branches sat a parrot made from real feathers, stood near the entrance to the tent. The pirates banded together and made a large chest in which to conceal their treasures. Everyone agreed to make and contribute an article, and each had to be accompanied by a written explanation of why this particular treasure was buried in the chest. On a definite date the chest was brought in with great ceremony by the leader, and the articles were displayed. The accompanying exposition, letter, or poem was read, the treasures were wrapped, and the chest was closed. Some of the contributions were quite amusing. One boy contributed a black, ponderous looking tome made from a cardboard box. On the front was a skull with crossbones, and a dirk inscribed with the title "Buccaneers' Bible" was emblazoned in white ink. Accompanying this was the following rhyme:

"I'm Terrible Dick of the Spanish Main;
I've notched my gun for all I've slain.
With my ship under foot and the tide at flood,
I cruise around in a sea of blood.
My crew never questions the orders I give,
They know to refuse is to cease to live;
We fight with others, but peace reigns on board;
They know I'm Master and the law's my sword.
All Buccaneers who come after me
Must follow this creed to conquer the sea."

Then the band divided into groups to write their history, each group being responsible for one chapter of the story. A committee heard the plans of each group and suggested changes to make the story cohere. An interesting account of an imaginary voyage resulted.

Devices are by no means confined to the lower terms; on the contrary, the maturity of the pupils heightens the possibilities. In the fourth term, classics that lend themselves to varied experiments are "A Tale of Two Cities" and "A Son of the Middle Border."

Today, perhaps more than at any time in the history of our nation, school should play a prominent part in developing sound character, in assisting young people to find some of the enduring satisfactions of life, in teaching them to weigh values and to discover the underlying causes of genuine success and to dissociate it from the purely superficial success which is so ephemeral. In a recent number of the *Journal of the National Educational Association*, the statement was made that "our schools must be dedicated primarily to educating men and women so that they may work and live together more successfully in and through the institution of a civilization that must be constantly adapted to changing conditions." A school must aim mainly at the fullest possible development of a social rather than a selfish personality. These classics, "A Tale of Two Cities" and "Son of the Middle Border," certainly are illustrative of the importance both of adapting oneself to changing conditions and of the development of a social personality.

In our discussions during the term, the danger of an attitude of disregard for changing social conditions was pointed out as exemplified by the utter indifference of the French aristocracy just before the Revolution. The lack of leadership among the nobles was considered, and we made emphatic the importance of developing statesmen to lead our country safely and peacefully through future crises similar in magnitude to the one we are now facing. Characters in "A Tale of Two Cities" were studied and their strength and weakness weighed. The interest later centered around the pioneers of the Middle Border, represented by the Garlands, and an attempt was made to discover how they developed the sturdiness to persevere in the face of great odds. Their characteristics were carefully considered, and why these characteristics existed was the source of much discussion. Certain definite conclusions were drawn: first, that the Garlands' home-training—the absolute obedience and respect on the part of the young people and the very wise and sympathetic guidance on the part of the parents—was a contributing factor; second, that the Garlands lived frugally, obtained enjoyment from simple pleasures, avoided debt, and developed in their home a spirit of harmony and sincere affection.

Compositions on these topics followed the discussions: "Home-life Then and Now," "Characteristics Essential to Success," "Character in Relation to School," "Manners and Character," "How I Can Help Economize," and "The Kind of Home I Want." They were divertingly genuine and refreshing.

Here are a few excerpts that give an idea of their sincerity.

A. "I, myself, hope that some day I shall have a home and children to be proud of. I fully realize that I can't have such a home and wonderful children by just wishing for it but will have to work for it. If I do have children and a decent home, I shall try to make these children happy, educate them, and train them to face the world. There is one big 'but' in this; children can't be made happy by giving them their own way as many people think. I shall listen to their quarrels or arguments. I shall train them to obey and to have respect for their parents. In case of trouble or any wrong-doing, I hope they will not try to hide it, but that they will come and confide in their parents and learn the right thing."

B. "Happy children can more easily do their school work and think better for themselves. They will not take their troubles too seriously, either. Some people do not realize how important it is for children to have a happy home life."

C. "I hope to be a 'buddy' to my son, to share in his misfortune and to profit by his reward. This partnership between father and son and mother and daughter is a very important factor in home development."

D. "I want to do my little bit now to economize. The largest expense in a budget, excluding food and rent, is clothing. Within the past few months I have been making my own dresses,

Scanned with CamScanner

and I don't find it hard work in the least, but really enjoyable. As everyone else is taking a cut, I can see no reason why I can't take one too. Last week my allowance was cut, which makes me like everyone else."

Jane Addams in "The Spirit of Youth and the City Streets" said, "We may either smother the divine fire of youth or we may feed it. We may either stand stupidly staring as it sinks into a murky fire of crime and folly, or we may tend it into lambent flame with power to make bright our city streets." Literature is a power which fans that "lambent flame." In fact, I shall go further and say that projects keep the flame from dying, for they supply an outlet for the pent-up energy and prevent the fire of youth from smothering. Opportunities to lead and to initiate new ideas "feed the divine fire."

EDUCATIONAL NOTES AND ANNOUNCEMENTS

New Federal Office of Education Service

How the Federal Government is moving swiftly and vigorously through ten new agencies and established departments to pull the United States out of depression will be reported this year in *School Life*, official monthly journal of the Federal Office of Education. The articles are especially planned to help teachers of history, civics and current events who wish to keep their pupils informed about the swift changes in national affairs.

September *School Life* carries articles on "Ten Thumbnail Sketches of the Ten New Agencies of Government," "The Children's Code," describing the effect of the child-labor ban, and "Public Works Funds for Schools." *School Life* will also tell how to obtain free, or at small cost, the laws, important documents, and mimeograph material describing the new work of the Government.

Articles on the changes in Government will supplement *School Life's* regular service of condensed findings of Federal Office of Education studies for easy reading. Regular features include: New Government Aids for Teachers (maps, pamphlets, films, exhibits), Electrifying Education, Recent Theses in Education, Have You Read?, and Education Abroad.

The fee for *School Life* remains the same—50 cents per year for 10 issues. Subscriptions to begin with the September issue should be entered now with the Superintendent of Documents, Government Printing Office, Washington, D. C. (Check or Money Order.)

Lectures at the Metropolitan Museum of Art, 1933-1934

The Metropolitan Museum of Art offers for the season of 1933-34 a varied and comprehensive program of lectures, gallery talks, study hours, and story hours planned for the interest and pleasure of the general public and of students concerned with the history and appreciation of art and with its practical application. Several courses are being given this year for the first time, and others have been extended in their scope.

Members of the Museum are invited to study, in courses planned especially to meet their needs, Painting in France and the Netherlands or the Mediaeval Spirit and other subjects presented in gallery talks at the Museum or at The Cloisters. Also for Members are study hours on color and its use, and for their children story hours and gallery talks given on Saturday mornings.

The free lectures on Saturday and Sunday afternoons will be presented, as in former years, by speakers of distinction in their fields. Among them will be Laurence Binyon, Walter Pach, William B. Dinsmoor, Rhys Carpenter, Günther Roeder, Royal Cortissoz, Ananda Coomaraswamy, Porphyrios Dikios, and Edward Alden Jewell.

Study hours for practical workers, gallery talks on the collections, lectures for the deaf and deafened, and story hours for boys and girls are other free courses to be offered on Saturdays and Sundays.

To teachers in the public schools of the City of New York, and to teachers and students in the College of the City of New York and Hunter College a number of courses are open without charge, and the successful completion of these will be accepted by the Board of Education as fulfillment of the study requirements for increments in salary. These courses are available also to students of other institutions and to the public on payment of a fee of twenty dollars for each course.

Among the most practical courses offered by the Museum are the study hours on design and color, arranged for employees of stores and of manufacturers. In 1933-1934 this group will include evening courses presented in coöperation with the Art-in-Trades Club and The Art Directors' Club. These study-hours are conducted by Grace Cornell, of the Museum staff, assisted by specialists in various fields. They are planned to show the relationship of the principles of design and color to the problems of designing, producing, and selling merchandise.

Two groups of motion pictures will be shown at the Museum: those produced by the Museum, dealing with various phases and periods of art, on Thursdays; and those made by Yale University, the Chronicles of America photoplays, on the first and third Tuesday of each month.

Finally, supplementing the talks given in the Museum, brief accounts of current exhibitions, recent acquisitions, and other subjects of particular interest are to be broadcast regularly over three station, WEAF, WOR, and WNYC.

An Announcement by the United Parents Associations of New York City

The Child Development Institute of Teachers College, Columbia Uni-

Scanned with CamScanner

versity, will assume direction of the training of mothers and fathers who serve as discussion chairmen of the study groups of the United Parents Associations for 1933-34, it is announced by Mrs. Roger A. Johnson, president of the Federation.

Of the 171 Parent Associations connected with the schools of the city and belonging to the Federation, an increasing number have established smaller, more intimate groups within their organizations for intensive study of child development and family relationships. In each of these study groups two members are chosen to lead discussion and these have been trained, in the four years since the activity was inaugurated, by a member of the professional staff of the United Parents Associations. For the coming year, this phase of the work will be directed by the Child Development Institute, but the organization will continue to contribute to its support. The service is offered free of charge to the individuals in training.

Immediate conduct of the work under the new arrangement will be in the hands of LeRoy E. Bowman, who is added to the staff of the Institute for this purpose. Mr. Bowman has for three years been identified with the Federation as a member of its governing board and an active participant in the work of a number of committees. As director of the Institute, Dr. Lois Hayden Meek will supervise the work, which is placed in the unit headed by Ernest G. Osborne, associate in child development and parent education.

Other members of the staff of the Institute and some advanced students in parent education will assist in the consultation and supervision of the groups. The study group committee of the United Parents Associations will continue active promotion of interest in this intensive form of parent education among the member associations.

Opportunity will be afforded for the training of a considerably larger number of leaders than in previous years. In the 1929-30 term when the activity was begun, there were twenty-eight study groups and this number had grown to fifty-one groups in the past year, of which ninety-five leaders were in training, and, in addition, 37 prospective leaders attended classes.

Careful records of progress will be kept so that the Institute and the organization may determine the most successful procedures for training lay persons for leadership in parent study groups.

A significant development of the work as planned by Mr. Bowman will be in inclusion this fall of fathers in the local study groups and in the classes for the training of leaders. While men have taken an increasingly active part in the work of parents' associations in general, especially in the past year, in part as a result of the activity of a fathers' committee of which Mr. Bowman was chairman, they have not hitherto participated in the study groups.

For the convenience of fathers who wish to take part in this phase of the

work, one or more classes for discussion chairmen will be held in the evening.

Changes

I should like to do something unusual for a teacher: utter a few words in defense of our present educational system. We are so apt to criticize details of technique and other things that we forget the great strides that have been made in the last century. This progress is most forcibly brought to light by the following quotation from Marx. If we have advanced so far in one century, what may we not do, perhaps with movies, radio, television, in another?

"Previous to the passing of the Factory Act, 1844, it happened, not infrequently, that the certificates of attendance at school were signed by the schoolmaster or schoolmistress with a cross, as they themselves were unable to write. 'On one occasion, on visiting a place called a school, from which certificates of school attendance had issued, I was so struck with the ignorance of the master, that I said to him: "Pray, sir, can you read?" His reply was: "Aye, summat!" . . . The inspectors, when the Bill of 1844 was in preparation, did not fail to represent the disgraceful state of the places called schools, certificates from which they were obliged to admit as a compliance with the laws, but they were successful only in obtaining thus much, that since the passing of the Act of 1844, the figures in the school certificate must be filled up in the handwriting of the schoolmaster, who must also sign his Christian and surname in full.' Sir John Kincaid, factory inspector for Scotland, relates experiences of the same kind. 'The first school we visited was kept by a Mrs. Ann Killin. Upon asking her to spell her name, she straightway made a mistake, by beginning with the letter C, but correcting herself immediately, she said her name began with a K. On looking at her signature, however, in the school certificate books, I noticed that she spelt it in various ways, while her handwriting left no doubt as to her unfitness to teach. She herself acknowledged that she could not keep the register. . . . In a second school I found the schoolroom 15 feet long and 10 feet wide, and counted in the space 75 children, who were gabbling something unintelligible.' . . . I have been in many schools where I have seen rows of children doing absolutely nothing; and this is certified as school attendance, and, in statistical returns, such children are set down as being educated." . . .

Another interesting quotation, relevant to education, is the following. It casts some doubt on the axiom of educators that a 40-minute drill achieves twice as much as a 20-minute drill.

"The factory inspectors soon found out by questioning the schoolmasters, that the factory children, although receiving only one-half the education of the regular day scholars, yet learnt quite as much and often more. 'This can be accounted for by the simple fact that, with only being at school for one-half of the day, they are always

Scanned with CamScanner

fresh, and nearly always ready and willing to receive instruction. The system on which they work, half manual labor and half school, renders each employment a rest and a relief to the other; consequently, both are far more congenial to the child than would be the case were he kept constantly at one. It is quite clear that a boy who has been at school all the morning cannot (in hot weather particularly) cope with one who comes fresh and bright from his work.' Further information on this point will be found in Senior's speech at the Social Science Congress at Edinburgh in 1863. He there shows, amongst other things, how the monotonous and uselessly long school hours of the children of the upper and middle classes, uselessly add to the labor of the teacher, 'while he not only fruitlessly, but absolutely injuriously, wastes the time, health, and energy of the children.' From the Factory system budded, as Robert Owen has shown us in detail, the germ of the education of the future, an education that will, in the case of every child over a given age, combine productive labor with instruction and gymnastics, not only as one of the methods of adding to the efficiency of production, but as the only method of producing fully developed human beings."

DeWitt Clinton High School.

Annual Meeting of the National Council of Teachers of English

Recent Experiments and Experiences in English Teaching will be the theme of the twenty-third annual meeting of the National Council of Teachers of English to be held in the Statler Hotel, Detroit, November 30-December 2.

At the opening session on Thanksgiving Day evening, Professors R. L. Lyman of the University of Chicago and Charles Swain Thomas of Harvard will discuss outstanding recent research in language, composition, and literature, and Dr. Dora V. Smith of the University of Minnesota will point out promising innovations in English teaching. President Walter Barnes' address will deal with English research and the National Council.

Professor C. C. Fries of the University of Michigan, whose forthcoming book, *Inflections and Syntax of American English*, is expected to cause as much discussion among educators as did *Current English Usage*, the survey published by the Council last year, will report on the organization's study of usage. Dr. Thomas A. Knott, general editor of Webster's *New International Dictionary*, will report for the committee on College English. Among those who will take part in the conferences and section meetings are Professor John T. Frederick, editor of *The Midland Monthly*, Dr. Janet Rankin Aiken, inventor of a new simplified grammar plan, Bess Goodykoontz, of the U. S. Bureau of Education, M. R. Robinson, editor of *Scholastic*, Mary Lamberton Becker, of the *Saturday Review of Literature*, and Howard R. Driggs, author of *Oregon Trail* and *Ox-Team Days*.

Of interest to educators generally, in view of the public attention recently focussed on children's reactions to movies by publication of the findings of the Motion Picture Research Council, will be the report of the Council's novel experiments in cultivating photoplay appreciation through English classes of fifty high schools. The report will be presented by William Lewin, of Newark, chairman. The use of radio as an adjunct to the classroom will be discussed by Max J. Herzberg, chairman of the newly formed Radio Committee.

The annual banquet on Friday evening will be devoted to the human and humorous sides of English teaching. Among the speakers will be Professor Franklin T. Baker, of Teachers College, Columbia University, who will relate some reminiscences of the long teaching career which has brought him a national reputation.

The sessions will be interspersed with sightseeing and social gatherings and will close with a luncheon on Saturday with well-known writers as guests of honor. All who are interested in educational progress are invited to attend the convention, whether they are members of the National Council or not.

The principal air lines are coöperating in arrangements for air travel to Detroit, and for the first time a number of teachers will fly to the annual meeting. The railroads are offering the usual special rates. Full information may be obtained from the National Council offices, 211 West 68th Street, Chicago, or from the Public Relations Committee, 246 Waverly Place, New York City.

The programs for the two evening sessions are as follows:

Thursday, November 30, 8:00 P. M.

Address of Welcome
FRANK H. CODY, Superintendent of Schools, Detroit

Outstanding Recent Research in Language and Composition
P. L. LYMAN, University of Chicago

Outstanding Recent Research in Literature
CHARLES SWAIN THOMAS, Harvard University

Promising Innovations in English Teaching
DORA V. SMITH, University of Minnesota

English Research—and the National Council
WALTER BARNES, New York University

Friday, December 1, Annual Banquet . . . . . 6:15 P. M.

Toastmaster, E. L. MILLER, Asst. Superintendent of Schools, Detroit

The Fun of Professing Books
EDWIN O. GROVER, Rollins College

These Statisticians
BURGES JOHNSON, Syracuse University

The Best I Can Remember

The conference on School Journalism includes the following discussions: "The School Publication as a House Organ," Gertrude Turner, Abington High School, Philadelphia; "When News Is English," Charles R. Gaston, Roosevelt High School, New York; "Relationship of College Undergraduate Journals to the Classroom," Helen Lockwood, Vassar College; "School Journalism as a Newspaper Man Sees It," Lee White, *Detroit News;* "An Experiment in Building a Journalism Curriculum," Margaret Sullivan, South High School, Cleveland; and "Nosing for News Down the Trails of Literature," Mary Wrinn, New York.

Work Relief Authorized for Unemployed Teachers

Needy, unemployed teachers will be given an opportunity to work for their unemployment relief at their regular occupation, according to an announcement today by Harry L. Hopkins, Federal Emergency Relief Administrator.

Stressing that the primary purpose of his action is to provide the necessities of life to unemployed teachers, Mr. Hopkins made known the fact that he has authorized State relief administrations to pay work-relief wages to teachers who will be assigned to regular school officials to teach in rural schools that have been closed or drastically curtailed. Some of the teachers may be assigned in cities, as well as in rural communities, to teach adults who cannot read and write English.

The expenditures from relief funds will be confined to the minimum needs of the teachers, and no relief money will be allowed for fuel, textbooks, or other school expense.

"I consider this kind of work relief one of the most constructive applications of the principle of exchanging service to the community for public aid," Mr. Hopkins said. "The need for relief to teachers is clearly apparent. Thirty-three States have reported through their education officials that approximately 80,000 teachers are unemployed. Some 15 States have definitely reported shortened school terms, and in some districts this has meant curtailing them to the vanishing point.

"While it is most emphatically not the intention of the Federal Emergency Relief Administration to subsidize the school system in any community or to relieve school officials of their responsibility, I believe that the expenditure of work-relief funds in the interests of destitute teachers will result indirectly in great community benefit.

"In many rural communities the complete closing of schools, virtually means the disintegration of community life for children. No one will ever be able to make up the loss to the children who are deprived of education, for the plastic state of childhood mind comes but once.

"Where schools are closed or terms are reduced to a month or two a year, despite increased enrollment, we have a great paradox. It is the expectation of the Federal Emergency Relief Administration that this paradox can be righted, in some part, by permitting the teachers to give their services on the basis of their relief needs."

Reports from one State showed that out of approximately 2,000 schools, 178 will not open this fall, depriving more than 2,000 pupils of educational facilities. Nearly 500 schools in the same State will open for only four months or less, while only a small percentage will hold the regular nine-months term. These curtailments will result in approximately one-sixth of the teachers being out of jobs, with many of them dependent on public aid for relief.

"While such figures are but a sample, they indicate to some extent the needy teachers who will have to turn to relief for their existence this year," Mr. Hopkins said.

The full text of Mr. Hopkins' communication to Governors and State relief directors follows:

"Your relief commission is authorized to use Federal relief funds now available or to be made available by the Federal Emergency Relief Administration to pay work-relief wages to needy unemployed teachers or other persons competent to teach and assign them to classrooms up through the eighth grade, provided: first, that these teachers are assigned by the relief offices to appropriate educational authorities who will have entire supervision over their activities; second, provided that they are assigned only to those schools which prior to this date have been ordered closed or practically closed for the coming school year because of lack of funds; third, this applies only to rural counties.

"State relief administrations are also authorized and urged to pay from above funds relief-work wages to needy unemployed persons competent to teach adults unable to read and write English. This applies to cities as well as rural counties. Under no circumstances should relief funds be used to relieve counties of their proper responsibility for education, nor should these activities permit the substitution of relief teachers for regularly employed teachers."

Pupil-Teacher Relationships

What is a wholesome personality? What kind of a human are we trying to shape in our classes, in our assemblies, in all the influences of the school? We would say, I suppose, a happy, successful, esteemed girl, the kind of a person who can and does think for herself, preferring the social good to individual indulgence.

And how do we in our relations with our pupils contribute to this personality? It seems to me that in so far as we contribute to their economic success and their personal efficiency we do this—and in so far as we elevate their tastes and build up their ideals of conduct, and stir their souls with beauty, we do this. Thus each day, every moment, to achieve these purposes, we are developing fine habits of work and important standards of achievement, decent ideals of person and conduct, aesthetic tastes for leisure time, an awareness of, and

Scanned with CamScanner

conscience for, socially alive issues. We saturate the most receptive, we tinge the less absorbing, we hope we guide the maladjusted. And in proportion as we operate for these ends in an atmosphere of affection for our pupils, trust of them, friendliness with them, relaxation, and freedom of pupil activity—so in proportion do we contribute to their wholesome personalities. And this we do nearly all of the time.

But do we always contribute to the wholesome personality? Teachers are occasionally accused of being domineering, dictatorial, too often ordering others. If we can be self-critical, must we not admit that we sometimes forget the rights of our pupils? May I suggest times when perhaps we do?

We call girls out of study hall and order them to do so and so for us; we forget to say frequently, "Have you time, or are you busy?" We let children stand first on one foot, then on another, waiting for us, while we go on working. We neglect to say sometimes, "Just a moment"—something courteous. We use the pupils' elevator between periods, embarrassing the elevator operator and forgetting the poor pupils whom we are causing to be late to class. Girls complain that we are inconsiderate in rooms and halls during examination time. They accuse us of being partial, favoring only the bright pupils. They say we show a grudging spirit sometimes about staying after hours to help them. We treat pupils one way, and other teachers another. We sometimes forget to apologize when we have been rude or bad tempered to a class or in the irritation of the moment have hurt the sensitive spirit of some girl. All this undermines fine relationships and thwarts the wholesome personality. Do you not think so?

But in the life of our school, these instances are so rare and isolated. Essentially we are kind, sympathetic people who value the personalities of our pupils. There is no opposition of pupil and teacher here. Our relationship stands for mutual respect, trust and community of interest.

MARY DENSON.
Julia Richman High School.

A Communication from Clyde R. Miller, Member of Executive Committee, Progressive Education Association (address Teachers College, Columbia University, New York City)

An appeal to the teachers of America "to emancipate themselves completely from the domination of the business interests of the nation," and to help strip the present economic system of evils by which a privileged caste obtains the lion's share of the wealth and income, is made in a manifesto issued by the Committee of the Progressive Education Association on Social and Economic Problems.

This committee, under the chairmanship of Professor George S. Counts of Teachers College, Columbia University, declares that "the progressive minded teachers of the country must unite in a powerful organization, militantly devoted to the building of a better social order."

The committee's manifesto is being issued in pamphlet form by the John Day Company under the heading, "A Call to the Teachers of the Nation." Committee members, in addition to Professor Counts, include Merle E. Curti, Professor of History, Smith College; John S. Gambs, Associate in New College, Teachers College, Columbia University; Sidney Hook, Associate Professor of Philosophy, New York University; Jesse H. Newlon, Director of the Lincoln School, Teachers College, Columbia University; Willard W. Beatty, Superintendent of Schools, Bronxville, New York, and President of the Progressive Education Association; Charles L. S. Easton, Director, Staten Island Academy, New Brighton, New York; Goodwin Watson, Associate Professor of Education, Teachers College, Columbia University; and Frederick L. Redefer, Executive Secretary, Progressive Education Association, Washington, D. C.

The committee's manifesto points out America has everything needed to banish poverty, with modern machines "capable literally of deluging men with goods and services of every description."

Under such conditions, it asserts it is possible to "bring economic activity into a balanced program of living, and engage in the building of a truly humane, beautiful and majestic civilization."

Notwithstanding the fact that America is a land of almost boundless plenty, the committee declares that a small privileged minority get most of the nation's wealth and income and that "for all except the most favored, life is an endless battle either for the simple necessities or for social status founded on the acquisition and display of property."

"Even during the much-vaunted period of prosperity ending in 1929," the manifesto states, "certain great industries, such as agriculture, coal and textiles, were in a state of chronic depression, and sixty per cent of the population were living below the level of comfort and decency."

It asserts that "under the existing economic system natural resources are exploited without regard for the future, the interests of property are placed above human rights, and the struggle for material gain tends to corrupt the moral, the political, and the aesthetic life of the nation."

"If men must suffer," declares the committee, "they should do so with heroism; if they need not, they should revolt. In the present age they should accept no apologies for a social system that fails to make full use, for the benefit of all, of the productive resources of the nation. Such a spirit should be bred in them from earliest infancy."

The manifesto urges that "short shrift" be made "of those men in posts of power who, while evading income taxes and indulging in every extravagance, seek to propagate a defeatist attitude among the people, give out a counsel of despair with regard to the future, argue that material prosperity for the masses is sinful, that the day of opportunity for the common man is over, that the great majority of the

Scanned with CamScanner

population must accept a reduction in the standard of living."

"Capitalism," it adds, "with its extremes of poverty and riches and its moral degradation of millions, makes an empty farce of our democratic professions and dooms multitudes of children to lives of severe privation."

It states further that teachers, as guardians of childhood, must know that the multitudes of children so doomed "will have to forego not only the luxuries which are literally showered upon their more fortunate brothers and sisters born to wealth and privilege but even those things demanded by the laws of physical and mental health. Teachers can never be reconciled to a social order that even in the days of 'prosperity' needlessly violates the deepest loyalties of their calling. Consequently, they must work boldly and without ceasing for a better social order."

Ultimately school revenue comes from all who labor by hand or brain, the manifesto points out, and adds; "This the teachers should never forget. Their loyalty, therefore, goes to the great body of the laboring population—to the farmers, the industrial workers, and the other members of the producing classes of the nation. They owe nothing to the present economic system, except to improve it; they owe nothing to any privileged caste, except to strip it of its privileges.

"They will have to emancipate themselves completely from the domination of the business interests of the nation, cease cultivating the manners and associations of bankers and promotion agents, repudiate utterly the ideal of material success as the goal of education, abandon the smug middle-class tradition on which they have nourished in the past, acquire a realistic understanding of the forces that actually rule the world, and formulate a fundamental program of thought and action that will deal honestly and intelligently with the problems of industrial civilization."

The manifesto advocates a broad program of adult education to bring to the parents of the nation full knowledge of the richer standard of living a more humane social order would bring to adults and children alike if America's resources were utilized for the good of all instead of for the profit of a few.

The manifesto urges teachers as American citizens to fight not only for their own rights in matters of tenure, compensation and formulation of educational policy, but also to oppose efforts of publishing houses, business interests, privileged classes, and patriotic societies to prescribe the content of the school curriculum.

The committee warns teachers that they will be crushed if they make such a fight as individuals. It appeals for a powerful organization of teachers "equipped with material resources, legal talent and trained intelligence necessary to wage successful battle in the press, courts, and legislative chambers of the nation."

"To serve the teaching profession of the country in this way," the manifesto concludes, "should be one of the

major purposes of the Progressive Education Association."

The Race Between Education and a Catastrophe

Those who saw active service in the world war and those who suffered from the effects thereof know its gruesome results and are firmly against another such disaster. However, one can notice with alarm that the members of the rising generation—those who were young and innocent in the storm and stress days of the late war—already entertain thoughts of grandeur about the next war. Little do they think of destruction, hunger, want, death! They see only snappy uniforms, "buddy-relationships," and a chance for a good fight. These budding soldiers are, however, not alone in their adherence to Mars. They are joined by that class of people which believes that war is inevitable. To them there must be wars—to end wars, to fight for democracy, and so on. These facts are significant. On the one hand, we have seeming evidence that there is a pugnacious instinct inherent in man, and on the other hand we find that Plato's belief is still valid, namely, nothing exists without having been preceded by an idea.

It is those very persons who talk about the inevitability of war who bring it about. Already yielding souls have whispered about the coming war and some have described its every detail.

What can our schools do to eradicate war from the list of human experiences? They can inculcate attitudes of friendship, of love, of coöperation between individuals and among nations. They can create an understanding which will make for forgiveness and no revenge. "Tout comprendre c'est tout pardonner." The supreme goal of education is to overpower narrow nationalism.

The school can direct the attention of students to unbiased films re-enacting the horrors of war, to actual photographs depicting scenes of war, and to institutions housing those unfortunates who are living witnesses to the injustice of war.

In the words of the modern apostle of Peace, Premier Ramsay McDonald:

> "Let's put documents on one side. Let's put signatures on one side. Let us substitute for them the less tangible, and the more real friendship, based upon a complete understanding of each other, a friendship which will allow a quarrel, a friendship which will allow a difference of opinion, a friendship which will not be broken if we were to vote against each other in the League of Nations, *a friendship that is kind because it is based upon a complete understanding*——"

Let us be mindful of "the race between education and a catastrophe." May Education win!

REVIEWS

Educational Leadership, Progress and Possibilities

Eleventh Yearbook, published by the Department of Superintendence of the National Education Association, 1933.

Though this yearbook is concerned chiefly with the educational leadership of the superintendent of schools, it will appeal to every supervisor and classroom teacher who is seeking a vital philosophy of leadership. A brief analysis of its contents will serve to indicate that it is a rich source of information on what constitutes the ideal supervisor and that it offers a stimulating challenge to all readers.

The book opens with a statement of those basic principles which should guide the leader who assumes responsibility for the success of others. We learn that educational leadership

1. Is exercised in and for a democracy;
2. Recognizes the school as one of the many institutions developed for the improvement of the social structure;
3. Recognizes that the school is dependent for its support and success upon the faith and will of the people;
4. Finds expression through the personality of individuals;
5. Is based upon character, intelligence, and feeling;
6. Requires judgment, patience, courage;
7. Represents vision, statesmanship, growth;
8. Is evaluated in terms of service to childhood and youth.

It is then pointed out that, as new economic and social forces make themselves felt, mankind in America seeks, through public education, solutions for the new problems. Educational leadership must, therefore, take into account the fact that ours is a dynamic civilization. The educator cannot ignore the implication of the interdependence of nations, the questions as to what form of government will lead to future happiness of the American people, the interdependence of man, the place of leisure, recreation, and avocation in educational planning, the forces that have been operative in the creation of a huge criminal class, and the needs of underprivileged members of society. It is obvious then that "a changing society will prosper as it entrusts the responsibility for its educational progress to an enlightened and well-trained leadership into whose thinking and planning have been interwoven the ideals of service for the common good."

With these principles as the ground work, the book proceeds to trace the development of leadership, that fascinating story of the battle to free the public schools. Then follows what is so important to us in these trying times of "cuts" and curtailments of budgets—the consideration of the importance of coöperation between lay and professional leadership. Then we have an extensive statistical report on the characteristics and qualities of those who are superintendents today. Our chapters are devoted to training of leaders and the place of research in educational progress.

The volume closes with a self-rating device whereby a supervisor may evaluate his progress. These are the items under the individual aspect of the scale:

1. The leader is a student of professional literature.
2. The leader utilizes and contributes to professional research.
3. The leader uses his leisure time worthily.
4. The leader is democratic and friendly.
5. The leader is intelligent and creative.
6. The leader displays courage and drive.
7. The leader is scholarly and cultured.

We must not fail to mention another contribution to our educational literature that this yearbook has made, a series of tributes to great educational leaders of the past; accompanied by photographs. There is a wide chronological distribution and a great diversity of interests and contributions.

We have often been accused by laymen and by our own critical brethren of failing to show any signs of having a national educational philosophy. The authors of the "Educational Frontier" attempted to formulate such a set of principles by vigorously attacking our educational "idols." This yearbook certainly helps the good cause by showing clearly what part a supervisor should play in carrying out such a philosophy. It just as clearly indicates the rôle of the classroom teacher. Whether we be supervisors or teachers we cannot help but be inspired by the biographies of our great leaders and we cannot help but measure ourselves by the principles set down. Finally, it is interesting to ask whether the philosophy of educational leadership advocated in this volume will be adequate to offset the social and economic handicaps that are weakening social progress on all sides today.

Social Studies Instruction

By Robert E. Swindler. Prentice-Hall, N. Y., 1933.

Present economic conditions are bringing sharply to the attention of educators everywhere the fact that emphasis has hitherto been placed on the natural sciences to an extent which has proven detrimental to the development of those studies which make for civic and social betterment. More adequate instruction in the social studies, with special attention to the needs of the gifted students who are the potential leaders of tomorrow, is the obvious need of a spiritually and culturally impoverished world.

In his timely publication, "Social Studies Instruction," Dr. Robert

Scanned with CamScanner

Swindler, who is a member of the faculty of the Department of Secondary Education in the University of Virginia, makes no effort to deal exhaustively with such aspects of social studies instruction as have been treated competently elsewhere by Dawson, Knolton, Tryon and others, but concentrates his attention on some of the more recent theories, methods and classroom practices with special attention to the important function of the school library in relation to the social science curriculum.

Practical suggestions as to the establishment of sound criteria for the selection of library material and motivation of its use by students and teachers and a bibliography of American history, which, though not as inclusive with respect to recent historical biography as one might wish, is in other ways most admirable, are among the useful features included in this volume.

In a closing chapter on "The Library and the Librarian: Their Conditions and Needs," references to Dr. Harold Rugg's recognition of the desirability of convincing American school communities of the serious need of spending large sums of money on school libraries for the provision of "a wealth of reading material which will introduce the youth to a vivid understanding of the current American scene," and R. T. Hargreaves' warm appreciation of constructive service to the cause of socialized education rendered by school libraries, sound a note of much needed cheer to members of a profession which has been designated accurately elsewhere as "the red-headed step-child of the American school system."

Essentials of Business Law

By Edward M. Kanzer and Charles W. Gerstenberg, New York. Prentice-Hall. 551 pages.

At last a long felt need has been filled by the authors of "Essentials of Business Law," a need for a usable text-book for pupils and teachers of Commercial Law. Heretofore so-called text-books for use in teaching commercial law have been written to supply the need of the business man as well as the pupil and as a result of the divided objective have failed to meet the need of either.

"Essentials of Business Law" is a teachable text. Each subject has been divided into topics, each of which treats completely one phase of the subject of the chapter and is a lesson unit in itself. Thus the teacher has a guide as to the amount of material to be covered from day to day and this arrangement presents a clear and simple picture of the material to the pupil.

This text employs a new method of approach. Most topics are developed inductively by first presenting a problem and then formulating the principle of law involved. However, in the reviewer's estimation, the authors have slightly overemphasized the inductive method to the detriment of a smooth readable text. Although this is a fine device for use by the teacher in the developing of the subject in the classroom, we may question whether a high school pupil, in reading his lesson at home, will stop to cogitate over an introductory problem before going on to the principle of law involved.

"Essentials of Business Law" introduces a method of answering legal problems which will train pupils to suspend judgment until the problem has been thoroughly digested and logically reasoned to a conclusion. This method obliges the pupil to use the following steps in answering such problems:

1. To restate the essential facts in the pupil's own words.
2. To state the disputed point at issue.
3. To give the principle of law involved.
4. To discuss the problem, including a clear analysis of the essential facts, followed by the reasoning based on the principle of law which leads to
5. The decision.

Although the foregoing method has been used from time immemorial by judges in writing opinions, its use in the field of commercial law is novel.

The sequence of subjects and their groupings are logical with the possible exception of "The Law of Negotiable Instruments." This subject follows the chapters on "Contracts." There is very little which the pupil has learned in the chapter on Contracts which he can apply to his study of Negotiable Instruments. On the other hand the gap from Contracts to Sales is much narrower. The pupil has already studied the Statute of Frauds as applied to the sale of personal property and a great number of problems used to illustrate the Law of Contracts are contracts involving the sale of personal property.

On the whole, the book should recommend itself to both the pupil and the teacher because of its simple and clear language, its helpful summaries, and its adequate questions, drill problems and review problems.

Supervision in the Social Studies

Third Yearbook: The National Council for the Social Studies.

Here is a volume which is of great importance to the supervisor or head of department in the social studies, and one which ought to capture the interest of the progressive teacher of those subjects. It is, as its title indicates, the annual volume of the National Council for the Social Studies which devotes each of its annual publications to some special phase of the teaching of the social sciences.

There is a wealth of pedagogical literature on the theory of supervision, but this book is an attempt to give the reader an intimate picture of the head of department seated at his desk and surrounded by his multiplicity of problems. Here is a real effort to permit the supervisor to "see the wheels go 'round" in the *sanctum sanctorum* of some harassed contem-

Scanned with CamScanner

porary. To give a wide scope to this study of the problems of supervision there is assembled a series of articles presenting supervisory programs developed in cities which are under the guidance of a special city-wide director of social studies, programs developed by the heads of department in individual secondary schools, and those developed in the one- and two-teacher rural schools.

To the classroom teacher the work of the head of department appears too often to consist of a number of visits per semester for the purpose of observing the teacher at work, visits which the classroom teacher does not contemplate with any degree of pleasure, and a larger proportion of the supervisor's time spent in unimportant routine activities not definitely connected with the problems of the teacher. This volume paints the supervisor in clearer perspective for the classroom teacher, brings him closer to the day-by-day teaching act, and consequently engenders a more sympathetic perception of the supervisor's problems, the reasons for many of the supervisor's acts which the teacher encounters only in their fruition, and as a result tends to promote a more intelligent coöperation between teacher and head of department.

The two chapters which will most vitally interest the heads of departments in New York's high schools are the articles by Miss Alice N. Gibbons telling her experiences as head of department of a large high school in Rochester, N. Y., and by Miss Jessie C. Evans, describing her work in a similar position in Philadelphia. In these articles one reads the story of a courageous, intelligent, progressive attack on the problems of supervision. It is as though these writers were each in turn saying, "These are the conditions I found, these are the measures I adopted to make my position one of constructive leadership and guidance, these the results achieved, these the objectives aimed at but not achieved, and this is the position we have not reached."

There is a minimum of theoretical discussion and a clarity and fullness of practical illustration which should make the supervisor grateful. He will find a detailed description of the administrative duties encountered by these heads of department, those same burdens which weigh so heavily on his own shoulders and threaten, he fears, to reduce him to the position of a glorified clerk. He will find treated in a direct and analytical manner the problems which beset the academic side of his work, such as keeping abreast of progressive ideas in his field, imparting those ideas to his colleagues, planning units of study, devising testing programs, and in general contributing to the pedagogical progress of the members of his department.

Consciously or otherwise the reader, especially the head of department, will find himself comparing the procedures used in his own department with those of the departments placed beneath the microscope of this volume, and he will perhaps experience a feeling of satisfaction when he discovers that his department is making use of procedures and programs similar to those which are set forth as worthy of commendation. But there will also arise a number of disturbing questions which will necessitate a wholesome stock-taking. There will be such questions as: "What courses besides a year of European History and a year of American History are offered in my department? Are they the most desirable courses available? What does my department do in the matter of ability grouping? If we are doing nothing in that direction, is it because I feel that ability grouping is pedagogically unsound, because there are too many administrative difficulties in the path of such a procedure, or is it simply inertia? Is it worth making an effort to secure ability grouping? What percentage of my time do I spend in visiting teaching? Has my department a feeling that they know definitely the objectives of the teaching of their subject and the methods to be employed in achieving those objectives? Are we teaching according to the 'unit plan'? If so, are we following the most progressive procedures, e.g., the Morrison method, toward obtaining maximum results from such a plan?" The list of such questions could be extended indefinitely. Suffice it to say that a critical reading of this volume with subsequent action on the questions which will inevitably present themselves will do much to help heads of departments contribute to the improvement of the teaching act, and to teacher growth, the chief aim of supervision.

THE EMERGENCY IN EDUCATION

. . . All of us, whether in public service, in private business or on the farm, have difficulty in seeing very far ahead. I know, however, that I can speak for the teachers and educational administrators of the country in assuring you that in the face of unparalleled difficulties we are going to "carry on" patiently and that we are going to work as diligently as any group in the country toward the solution of this great social problem which is our mutual concern.

For it must be remembered that the schools do not belong exclusively to the children, the teachers or the superintendents. They are the common property of us all and in the long run there must be public assent for every important change of educational policy and for every provision for financial support. What is done about the schools in this present emergency will therefore be determined around our firesides and in our public gatherings.

Throughout the coming year those of you who have been fortunate enough to be steadily employed and many millions of others, who are again joining the ranks of productive wage earners, will have the familiar but highly significant personal problem of how to spend your income. I have no doubt but that after so long a period of self-denial there will be a great rush to secure those personal necessities of which many people stand in great need. We should not, however, permit ourselves so to indulge in passing pleasures as to forget the more enduring satisfactions which we get out of our social institutions including our schools and colleges. . . .

My friends, we seem about to emerge from a great economic crisis which has tried the souls of men and women far more than the great world conflict which ended in 1918. I know that I speak for the schools and colleges of the country when I say that they will coöperate with President Roosevelt and the Congress to the fullest extent in helping to pull the country out of the depression. With common purpose and united effort we shall certainly succeed in overcoming the enemy.

However, as men and women again find themselves gainfully employed and are thus able to supply themselves with the necessities of life, we are faced with another great crisis which will test the quality of our citizenship more than anything which we have yet encountered. We shall have an opportunity to demonstrate whether we wish the advantages of education for ourselves and our children enough to pay for them. We are now being called upon to decide whether we will retain and develop those evidences of culture and civilization which alone make life worth living. We are confronted with a choice as to whether we will spend the great amount of leisure time which is being thrust upon us in idle dissipation, or whether we will use it in a great program of self-improvement. Those who know the history and the heart of America can never doubt what course the American people will take. In this critical emergency the schools and colleges stand ready to serve as the chief agency of social progress. Out of trial and adversity, we can yet have we shall yet have, through a broadened educational system, opportunities for a better, fuller life than any with which the American people have so far been blessed.

GEORGE F. ZOOK

United States Commissioner of Education.

In His Radio Address of September 11, 1933.

FIRST ANNUAL REPORT OF THE GUIDANCE DEPARTMENT OF THE SAMUEL J. TILDEN HIGH SCHOOL

It is hoped that this report will help to answer many of the questions which are being asked concerning Guidance in Samuel J. Tilden High School. The report sets forth a comprehensive, rather than an exhaustive, account of one year of Guidance in a large city high school.

Because this has been the first year the emphasis has necessarily been upon staff training in aims and techniques and upon office organization. The machinery, however, has consistently been devised to serve human ends, not to control them.

The report purposely omits long discussions of theories, objectives, and many other controversial points in which Guidance abounds. It attempts to tell the factual, objective, quantitative story. To write the full story in its subjective setting would be infinitely more difficult, as difficult as human personality is subtle. It would mean painting a picture of 1,089 different personalities, each the hero in a drama of the forces of life itself. The record of each one lies, as a matter of fact, between the covers of a folder in the confidential files of the Guidance Office. It will be the material for a later chapter of the report. At present it forms the voluminous appendix to this report.

Any justification of Guidance, at this stage in Tilden High School, must rest largely on *a priori* grounds. That an individual boy or girl stands in danger of being lost in the mass in a school numbering 5,848 souls, where subject teachers are bedeviled with many and large and heterogeneous classes and long syllabi, where administrators have the exigencies of huge numbers and rigid curricula to meet —stands in no need of support. That the social and economic and industrial order is undergoing rapid reconstruction adds to the complexity of life for growing boys and girls who are preparing for an uncharted world.

What does the Guidance Department think it can offer to offset the tremendous forces that are at work? Surely a handful of Guidance Counselors do not presume to set the world in order? Yet that is precisely the task that the Tilden Guidance Department has set for itself. But the world is each boy's and girl's small world, handled one by one. Setting it in order means sitting down calmly and quietly with a boy, helping him to analyze his world, to see it objectively, to distinguish reality from fancy, to measure it by eternal as well as material values, to see it in perspective, which is nothing more than admitting at once its significance and its insignificance. It means understanding that world sufficiently to make an intelligent adjustment to it.

Scanned with CamScanner

Our Guidance Department inclines to think with Dean Donham that it can make its best contribution to social and economic problems by creating methods of adjustment rather than through a reliance on foresight, inasmuch as Guidance is not prophecy.

The counselor can provide the opportunity and the motivation and some techniques for accomplishing these ends. She can attempt to integrate and coöordinate and pull into focus the bits of experience and environment that make up an individual's world. Do not the mere recognition by a school of the need of this kind of service and the mere fact of provision for it in a school furnish justification for Guidance?

The report of the accomplishment of the first year of the Guidance Department in Tilden High School shrivels by contrast with these immense aims. What progress has been made toward them, toward better human adjustment, through the activities of this Guidance Department, you are left to judge and the future to fully reveal.

Who Came to the Guidance Office?

During the first year of the existence of the Guidance Department at Tilden High School, from September 12th, 1932, to June 15th, 1933, one out of every five students of the school visited the department. That makes a total of 1,089 students, or 18.6% of the 5,848 students in the school. This total does not include 334 applicants for employment—full or part time—whose problem was exclusively one of placement. Neither does it include a group whom we have called casuals who dropped in to consult a counselor on some point which could be cared for at once. There were 331 such casual visitors.

Of the 1,089 students who came, 491 were girls (16.5% of all girls in the school and 45% of all those who came for Guidance) and 598 were boys (20.7% of all boys in the school and 55% of all those who came for Guidance). Five hundred ninety-three were general course students (19% of all general course students and 54.4% of those who came for Guidance), and 496 commercial course students (18.1% of all commercial course students and 45.6% of those who came for Guidance). Seven hundred twenty-two were in the early session (22% of all early session students and 66.3% of all students who came for Guidance), and 367 were in the late session (or 14.2% of all late session students and 33.7% of those who came for Guidance).

Their state of advancement in the high school course was as follows:

Term	Number
1st	121
2nd	97
3rd	164
4th	169
5th	134
6th	155
7th	141
8th	108
Total	1,089

Who Sent These 1,089 Students?

They came through many different channels. Eighty-six of them (7.9% of those who came for Guidance) were referred by administrators as follows:

John M. Loughran, Principal	7
John Shea, Administrative Assistant	3
Olga H. Hingsburg, Administrative Assistant	12
Joseph O'Toole, in Charge Early Session	20
Nathaniel Singer, in Charge Late Session	31
William J. Hanley, Attendance Officer	5
Michael J. McCaffrey, Annex	8
Total	86

Of the total number coming to the office, 242, or 22.2% were sent by 80 teachers (28.8% of the teachers of the school), as follows:

Department	No. of Teachers	No. of Students Referred
Accounting	1	1
Art	2	4
Biology	1	12
Economics	3	33
Elocution	3	11
English	14	23
French	7	13
German	3	6
Guidance	5	6
Health Education—Boys	2	12
Health Education—Girls	1	53
History	6	6
Home Economics	2	3
Joinery	1	2
Latin	3	6
Mathematics	4	7
Music	1	5
Physical Science	2	2
Spanish	3	6
Stenography	7	14
Grade Advisers	5	6
Custodian	1	1
Clerks	3	10
Totals	80	242

Thirteen students (1.2% of those who came for Guidance) were referred by their parents.

One hundred eight students (9.9% of those who came for Guidance) were referred to the Guidance Department by agencies, as follows:

Board of Child Welfare	95
Board of Higher Education	1

The Guidance Department itself initiated the visits of 374 of the students who came (34.3%). Three hundred forty-seven of these represent those students throughout the school who had previously failed in three or more majors in one term. Twenty-seven of them were outstanding students eligible for correlated work in Physics and Mathematics, whom the Guidance Department counseled regarding the advisability of taking these courses.

And last, though most important, is the group numbering 266 (24.4%) who came of their own accord. The Guidance Department is inclined to measure its success to some extent by these, since it seems to argue student confidence in the Guidance Department. Students, in the long run, will not waste time coming to an office which does not serve them intelligently and constructively. Our success during this first year, therefore, in attracting 266 students to the Guidance Office as voluntary petitioners for counsel gives us good

Scanned with CamScanner

cause, we think, to rejoice. In these students we have at once a yard-stick and an inspiration.

Why Did They Come?

They had all reached a crossroads of one kind or another. Sometimes it was a place where conflicting emotions met, or desires, or perceptions; sometimes it was a place where parents and children had to part in order to meet again as adults; or it was a crossroads where choices had to be made regarding a vocation or a college, or a course of study, or formal education of any kind at all. These students wanted, in general, to have pointed out to them the destinations of one or more roads.

Most of them had questions to ask. The questions were usually very close to their innermost ambitions and struggles, or else they skirted round them. They were really questions related to living, to getting a living, to securing success in school scholastically, athletically, socially, to obtaining satisfactions; in a word—to being happy. Some of the central problems around which the questions centered were:

Problem	Those Who Came Number	%
1. Serious school failure	347	31.8
2. Physical handicap	64	5.8
3. Home adjustment	95	8.7
4. Behavior in school	271	25.2
5. Educational plan	150	13.7
6. Vocational uncertainty	162	14.8

As we noted above, applicants for employment are not included here. Wherever a student applying for employment was considered to be in need of Guidance along the lines indicated he was referred for counseling.

Students in need of relief exclusively were taken care of by the Administrative Assistant.

Who Counseled the Students Who Came?

The personnel of the Guidance Office was as follows:

Elsa G. Becker	Chairman
Josephine D. Borkes	Counselor
Albert J. Levine	Counselor and Psychologist in charge of testing
Imelda S. McCann	Placement Counselor
Jennie Montag	Secretary to Chairman and Counselor
Regina C. Weiss	Counselor

In addition the department was fortunate in having, during the second semester, the volunteer services of two men who undertook the work capably and contributed materially to the work of the office. They were

Irving R. Stone	Assisting Counselor, on full time
Burrill Freedman	Visiting Psychiatric Adviser—½ day a week

The counselors, without exception, had both teaching and business or industrial backgrounds. It was, however, for their attitudes, sympathies and emotional stability as well as their professional experience that they were selected for the Guidance Staff, for the counselor is a new kind of group person in the school—new at least to the students' experience. She does not write marks in a book, or issue orders, or say, "Stop talking" or "Straighten lines"; but listens and shares experiences and suggests and treats one pretty much like another human being.

The greatest part of the counselors' time was devoted to interviewing. A total of 4,397 interviews was given to students. Of these 1,089 were first interviews and 3,308 re-interviews. The average is four interviews per student counseled. As a matter of fact, of course, some students had many more interviews than others, depending upon the problem to be solved.

But to those 4,397 student interviews must be added 1,432 with individuals involved in the students' adjustment. Perhaps the chief boast of a good Guidance Office is that it deals with the boy or girl as a complete personality, with consideration for his or her life in all its varied phases—not only the school or intellectual phase. If the whole child is to be understood, the school must open its doors and go out into the home and the community to learn the background of the child's life and the influences that are creating attitudes. In counseling the 1,089 boys and girls who came, it was found necessary to conduct 1,432 personal interviews with faculty members, parents, and representatives of community agencies as follows:

	Number of Interviews
221 Parents	239
58 Agencies	284
154 Teachers (including 9 Grade Advisers, 8 members of the Clerical Staff, 1 Librarian)	720
8 School Administrators	189
441 —— Totals ——	1,432

Coöperation ranged all the way, among teachers and administrators, as well as parents and agencies, from active intelligent participation to total neglect. Interaction of this kind stands in need of constant development. All working for the boy and girl must become better and better acquainted with each other for the maximum contribution to the boy's and girl's welfare. And without good will in the community and in the school, the Guidance Department will be seriously blocked in its work. A partial list of the 58 agencies contacted by visit either of the counselor or of the agency's representative follows:

Adjustment Service
Board of Child Welfare
Boy Scouts of America
Brooklyn Juvenile Protective Association
Bureau of Child Guidance
Cardiac Vocational Guidance Service of the New York Tuberculosis and Health Association
Community Church Clinic
Curative Workshop of the American Rehabilitation Committee

Is the Interview a Pleasant Chat—and Nothing More?

Because the interview is the most important tool employed by the Guidance Department the counselors have made a special study of it over the year in an effort to acquire increasing skill in using it.

Teachers and even parents have often expressed surprise that the Guidance Counselor had unearthed some aspiration or fear the recognition of which was important to adjustment. One parent said appreciatively, "Well, there are tricks to every trade." And he was right, if valid, effective techniques are tricks.

The counselor unaware of such behavior tendencies as resistance, projection, introjection, and transference is not the best counselor. To know when and how to use an indirect attack, and how and when to make a student feel he is an equal who can exchange opinions, how to dispel the fear that the counselor is "an arm of the law or an abettor of school or home discipline"—is to be equipped with useful devices for good Guidance.

The Guidance Department, therefore, worked on a project each semester to discover the techniques of interviewing. Some of the questions answered by the study were:

To what may reticence or inhibited responses on the part of interviewees be due? How may these be removed?

What information would you wish to obtain in interviewing a boy or girl seeking help in selection of an educational program? A boy or girl seeking a position? A boy or girl seeking help with personal problems?

What value have returns on employment interviews for teachers? For counselors?

What are the criteria for determining the success of a personal interview?

What About Testing?

The Guidance Department administered 223 tests, as follows:

To measure so-called general intelligence	168
To measure mechanical aptitude	46
To measure emotional traits	6
To measure character traits	3
Total	223

The tests were found in some instances to be a valuable check on school marks and teacher estimates, the I. Q. having been especially valuable for diagnosis where it has been at variance with school achievement. It has had a certain prognostic value—chiefly of a negative kind—in cases where vocational ambition exceeded a reasonable estimate of ability.

Experience with mechanical aptitude tests inclines the department to the belief that because it was not possible to cover a greater range of special aptitudes and because of the lack of refinement and standardization of the tests themselves there was not much value in administering them.

The personality testing has been too limited to permit an expression of opinion.

Tests have been consistently regarded as *another* tool, not to be compared in importance, in the present stage of development, with the interview. Test results have been carefully used, care being taken not to pin too much faith on them. They have been weighed against results of interviews, school records, and all available ratings. The subjective findings of the psychologist have had some value. The test report has included wherever possible a statement of behavior during examination, analysis of results, and recommendations.

For some students it has been possible to obtain the testing services of outside agencies, which have usually been superior to the testing in the Guidance Department in point of physical facilities, completeness of the battery, and the specialized experience of testers.

What Besides Interviewing Made Up a Counselor's Day?

The counselors found a place in each day for countless other duties besides interviewing students, parents, teachers, and visitors. These are some of them:

Writing Up Records

The Guidance Department does not make a fetish of records, and will never aspire to three-inch folders except in unusual cases. It does, however, insist upon a succinct account of every contact made in a case, with enough information to enable a newcomer to continue treatment where it was left off. Twice a year every case handled is briefly summarized on an appropriate form, in order that no student may escape proper follow-up.

Contacts by Telephone

To homes, community agencies, schools, employers, and the like.

Scanned with CamScanner

Visiting Classrooms

Writing Letters

Each counselor is responsible for her own correspondence unless it involves matters of departmental policy.

Attendance at Weekly Department Meetings

For discussion of problems.

Interviews with the Chairmen, Psychologist, and other Counselors

Field Work

Visits to community agencies, other schools, employers, an occasional home.

Writing of Reports

On field work.

Attendance at Conferences

Writing of Articles

For the student paper (*Tilden Topics*).

Meeting Two Auditorium Groups

On Thursday of each week, either for a short talk on prepared subjects or to invite questions.

Building and Proctoring Assignments

Did the Counselors Think They Needed Alertness Courses?

It happened that none of the counselors was required by the By-laws of the Board of Education to take alertness courses, for one reason or another, but here is the record of their attempts to keep alert:

Full courses attended in mental hygiene, child guidance, testing, vocational counseling	15
Full courses attended in related social problems	5
Full course given in social problems	1
Attendance at Mental Hygiene Clinic as Psychologist	1
Lectures attended on Guidance subjects	24
Personal visits to outside agencies including schools	75

Each counselor, while remaining a general counselor responsible for carrying a boy or girl through from beginning to satisfactory conclusion, was responsible for some particular field of interest as follows:

	Opportunities and institutions for handicapped students, with special reference to cardiacs.
Dr. Levine:	Mental hygiene and mental testing resources of Brooklyn and Manhattan.
Mrs. McCann:	Non-profit making employment agencies in Brooklyn.
Miss Montag:	Occupational information.
Miss Weiss:	Opportunities and institutions for the handicapped with special reference to the crippled, the hard of hearing, and those with defective eyesight.

All of these individual experiences have very generally been shared with the entire department, through discussion and report. Reports of all courses, lectures, and visits are on file in the Guidance Office. All of these visits and lectures represent time outside of the prescribed schedule.

The chairman is happy to have the opportunity to say that the counselors showed splendid professional spirit, regarding their duties in the light of *service* rather than a mere *job*. Time given freely to the office, and time and energy devoted to visits, courses, and lectures, do not adequately describe their attitude. The constant reading in the vast field of Guidance, as well as thinking and discussion along Guidance lines, attendance at professional luncheons and dinners, and membership in professional organizations, come nearer to telling the story of their adventures in alertness. The problem of the chairman was not how to spur counselors on to activity, but rather how best to direct superb energy.

Was the Guidance Department Represented Outside of Tilden High School?

The Chairman of the Department had the opportunity of speaking at the following meetings:

High School Teachers Association

Association of Teachers of Vocational and Educational Guidance

New York Branch of the Vocational Guidance Association

Secondary Council of the United Parents' Association

Parent-Teachers Association of Tilden High School

Museum of the City of New York

Alertness course in Vocations and Industries, Civics II, four lectures

She served on the following committees:

Revision of Civics II Syllabus
Member of several subcommittees
Chairman of subcommittee on bibliography

Brooklyn Council of Girls' Service Organizations
Chairman of committee on Vocational Guidance

Association of Teachers of Vocational and Educational Guidance, Program Committee

Y. W. C. A., Central Branch, Brooklyn, Employment Committee
Chairman subcommittee, Personal Service Division

She published guidance articles in the following professional papers:

School December 29th, 1932
High Points February, 1933

How Did the Guidance Department Make Its Wider Approach to the Rest of the School?

I. *To the Faculty*

The Chairman issued six memoranda to the faculty during the year:

Fall Term

Date	*Subject*
October 3, 1932	*The Form for Referring Students to the Guidance Office*
November 1, 1932	*Detecting Problem Boys and Girls*
December 1, 1932	*Mental Hygiene Reading*

Spring Term

March 1, 1933	*Vocational Problems of Tilden Students*
April 5, 1933	*Vocational Guidance in a Chaotic World*
May 3, 1933	*Vocational Implications of the Subjects You Teach*

The Guidance Committee of the Faculty was organized with representation from each department of the school. The first meeting of the committee took place on April 12th, 1933. It began to work on a long-term project to uncover the vocational significance of the present curriculum.

The Chairman addressed the faculty twice during the year. They were also reached through the school

Scanned with CamScanner

Calendar and through invitation (in individual cases) to attend Guidance Department weekly conferences.

II. *To the Student Body*

Every issue of *Tilden Topics*, the student paper, carried an article known as the Guidance feature, written by a member of the Guidance Department. The titles (assigned by student editors) are given below:

Dates	*Titles*
October 7, 1932	*Let Future Vocation Be the Guide for Programs Advises Counselor in Charge of Guidance*
October 21, 1932	*"All Aboard!" Trip Through Vocation Land — Salesman or Architect—Where Will You Land?*
November 4, 1932	*Salesmen Must Overcome Sales Resistance: Training and Serious Preparation Needed*
December 23, 1932	*More Attention in Class — Less Work at Home*
February 17, 1933	*Are You in the Right School?*
March 3, 1933	*Guidance Counselors Visit Industrial Schools: Observe Method of Teaching Through Projects*
March 17, 1933	*Mechanical Courses Gain in Popularity*
March 31, 1933	*Little Red School House Offers Modern Instruction*
April 7, 1933	*Spirit of Comradeship Reigns in School Where Boys Take Courses They Like Best*
May 2, 1933	*Beauties and Butchers Mingle in Novel System*
May 18, 1933	*Waves and Manicures Are Part of Day's Work in School Where Work Is Play*
May 26, 1933	*Mysteries of Manufacturing Divulged at Deskless School*

The *Tilden Guide* also carries a message from the department to students.

During the Fall term counselors by turns addressed the morning session students each week at four twenty-minute auditorium meetings. The subjects covered were:

An Airplane View of Occupations
A Close-up of Some Occupations
What an Employer Will Want to Know About Me
Study Hints

This auditorium program was not, on the whole, successful, due rather to poor acoustics and a general school problem than to causes over which the Guidance Department had immediate control. However, speaking to large groups of students requires skill which some of the counselors will have to develop in order to make use of group counseling methods. And then, unless a talk were to cover merely the most superficial points, considerable research was required to talk intelligently and informingly on either a wide or narrow occupational field. While it is expected that counselors shall equip themselves in this respect, the process of doing so is necessarily a progressive one that will take time to achieve.

During the Spring term, the Guidance Department experimented with another means of meeting the student body in a group. A counselor went into the auditorium as formerly, but merely announced that she would be available at a table near the platform for consultation with anyone who wished. She sometimes arose to

say a few words on some subject suggested by student discussions of the moment. This seemed to have definite values in giving specific vocational information (though of a sporadic sort) as well as in informing the student body of the nature of the services of the Guidance Department.

Another type of group counsel has grown out of a similarity of needs evidenced by several students coming for interview by one or several counselors. Such individuals were gathered together and led in discussion by a counselor. This was an occasional occurrence, however, which will need encouragement to develop into a counseling technique in the department.

What Machinery Did the Guidance Office Set Up to Facilitate Its Work?

The creation of a Vocational Bookshelf and of an Occupational Pamphlet File in the Library of the school have brought results, if the circulation of the books and pamphlets indicates anything. Miss Emily K. Colwell, Librarian, reported as follows on this point:

> One of the sections of the library that has been used the most during the past year is the Vocational Guidance Shelf. These books are taken out by teachers and students. The students seem particularly interested in any book that will give them information about vocations. For the number of books that are in the library on these subjects, the circulation is quite large.

The Reference File of Pamphlets on Vocations seems to be of special interest. This is used constantly—during almost every period we have requests for some or all of the pamphlets. Besides the individual students interested in vocations, classes are sent in from the Economics department, the English department, and the New York City Industries classes. These groups spend a whole or a part of a period in the library consulting the pamphlet collection. Students have also come from the Annex in the afternoons to consult the file.

In order to answer the requests for information on these subjects the library needs especially more books on individual vocations. More pamphlets and additional copies of those already in the collection would be very useful.

The Guidance Department advertised the Vocational Bookshelf and Pamphlet File to the faculty through a circular, distributing a classified list of both books and pamphlets. Both shelf and file need, as Miss Colwell indicates, considerable and constant extension. To this end the Guidance Department has asked to be placed on the mailing lists of organizations and institutions furnishing occupational information. The range of vocations covered by the file may be seen from the list given below. The numbers refer to the *different* pamphlets for each occupation.

The following seventeen forms were evolved out of the needs of the office:

Teacher's Referral
Report to Teacher
Result of Interview
Daily Interview Record
Interview Sheet
Call for Student
Call for Transcript of Record
Answer to Employer's Inquiry
Inter-office Communication
Psychological Report
Board of Child Welfare Investigation
Request for Testing
Scholarship Summary
Summary
File Sheet
Teacher's Estimate
Cumulative Record
Employment Rating Sheet

An index of occupational materials, following the lines of the five-fold index originated by the late May Rogers Lane, has been of the utmost use to counselors in the vocational guidance aspects of their work. It has made available for ready reference the vast accumulation of daily and weekly news items, magazine articles, memoranda, mimeographed reports, clippings and extracts which are often more valuable than book material, but extremely elusive unless their acquisition is systematized. The index to date is the product of contributions from all the counselors and some of the more coöperative and progressive teachers. It is ably administered by Miss Jennie Montag, counselor in the department.

A central alphabetical index is used for the identification of all students under the direction of the office. And the files of the department, made up of folders for individual students, are confidential to the department.

A Question Box, kept under lock and key, received the written communications of any and all students. A number of shy students were heard from in this way, who might not have had sufficient courage to make the first approach to the office personally.

What Became of the Students Counseled?

I. "Closed" Cases

During the year the Guidance Office closed the cases of 244 (22%) of the students who came to it or were sent to it for help. Of these, 10 were considered to be beyond the skill or scope of the department to treat further. Perhaps they spelled failure for the department. Of them it can only be said that the counselors exhausted their own skill, availed themselves of the services of experts, enlisted coöperation where need for it was indicated, consulted with the staff — and still failed. They represented personality difficulties requiring adjustments of a complicated or subtle nature. The Guidance Department made every attempt to coördinate the factors — chiefly home, school, recreational, physical, emotional — entering into each situation. School adjustments were relatively easy to make, since teachers and companions were accessible and pretty generally amenable to suggestion, and the utmost latitude was allowed in scheduling studies. But home situations very naturally proved less flexible. And sometimes home coöperation was not forthcoming or was definitely antagonistic to the treatment proposed.

It may reasonably be asked — Why then *close* the case? The answer is two-fold; first, closing a case does not mean that it will not be followed up at relatively long intervals; second, the Guidance Department exists to serve the *entire* student group. When, after very careful consideration by the staff, it is found that further work with a student will consume time altogether disproportionate to results, the chairman closes the case so far as regular interviewing is concerned. The student may, of course—and often does—still drop in to see the counselor. This policy is dictated by the necessity of benefitting the largest possible number of students and by the principle that it is the function of the Guidance Department to discuss, diagnose up to a point consistent with its training and skill, refer, coöperate, evaluate, and suggest, but not to make decisions that *should* be made by parents, boys, and girls.

The remaining 234 students of this group closed for active guidance may be divided into those numbering 173 (73.9%) whose adjustment was effected through removal from the school into another environment, including 20 graduates. Forty-three of these 173 were transferred to other high schools, industrial schools, private schools, and the National Farm School. One hundred thirty-one of them (75%) were discharged for physical care, employment, or further education or training. It may be mentioned here that out of the 334 students who applied for working papers with the intention of leaving school, 88 (26%) were enabled to remain in school through program adjustment, change of session, and part-time employment.

Sixty-one still remain as students of the school, discharged from the active care of the Guidance Department because adjustment has been

Scanned with CamScanner

effected. How temporary or permanent the adjustment is time alone will tell. The following tabulation indicates the various accomplishments with these 61 boys and girls:

Change of attitude effected		
To studies	15	
To teacher	4	
To social situations	4	
	—	23
Decision reached concerning further education or training		18
Tie-up with school agency effected		7
Methods of study improved		5
Schedule of studies adjusted		4
Tie-up with outside agency effected		
For physical care	2	
For speech defect	1	
For vocational information	1	
	—	4
Total		61

II. *School Failures*

How many of the 347 students counseled by the Guidance Department on account of serious school failure improved in that respect? Because these boys and girls were selected for having failed three or more major subjects improvement may be defined as the passing of at least one out of three majors. Because of the pressure of end-of-the-year duties the three counselors who guided the majority of this group made a random selection of 149 students (31.8% of the failing group) and examined their final term ratings. The results follow:

Counselor	*Size of Random Sample*	*No. Showing Marked Improvement* (1)	*No. Showing Good Improvement* (2)	*No. Showing Slight Improvement* (3)	*No Improvement* (4)	*Retrogression* (5)
Mrs. Borkes	55	24	18	12	1	0
Miss Weiss	50	24	16	6	4	0
Dr. Levine	44	16	18	0	6	4
Total	149	64	52	18	11	4
		43%	35%	12%	7%	3%
			90%			10%

If the improvement of the school record in these cases constitutes proof that the Guidance offered was effective, then these results are cheering, for 90% of the records improved, 43% in a marked degree, and only 10% remained unsuccessful or developed additional signs of maladjustment to school.

In the light, however, of the close study of a group of failures and drop-outs of the school made by the Chairman during the Spring of 1932, and the experience of the department thus far, there are many qualifications to be made to these results.

Inasmuch as the recommendations made in connection with the Guidance of these failures as a group covered the following general points

Home Conditions
- Physical
- Financial
- Attitudes

Emotional Adjustments
- Guidance Office
- Psychiatric Clinic
- Teacher Help

Employment
Extra Help
Methods of Study
Health Adjustment
Recreation
Socialization
Change of Program
Change of Session
Change of School

may not Guidance have functioned effectively without necessarily producing the arbitrary sixty-five per cent?

The department inclines to disparage exclusive dependence upon pragmatic proof in matters of this kind. It therefore considers it not entirely impossible that some success may have been achieved by working even with those students (the 10%) who failed to improve their school records. By the same reasoning it also admits that the 90% group of those with improved school records does not reveal the whole story, for it omits the human adjustments indicated by the list of recommendations given above.

We must also temper the results showing improvement for the following reasons:

1. Each of these students carried only three major subjects, as opposed to four last term.

2. In the majority of cases, two of these three subjects had been studied last term, so that the student required two terms to complete the work of one. In such cases, it is difficult to determine whether passing the subject is due to any change within the student, or to outside and extraneous factors.

3. In a number of these cases, the mark achieved after repeating the subject was merely 65%. In many instances, this 65% was the only passing mark achieved during the term, both class mark and uniform examination marks at the end of the second third of the term having been failures.

III. *Vocational Counsel*

The 162 students who came to discuss their vocational future were helped in accordance with the policy of the Guidance Department which was expressed in a memorandum to teachers on this subject.

In addition I wish to say that in the Tilden Guidance Office we are committed to the policy of counseling in this perplexing time with a view to creating in students understanding of the facts and difficulties confronting them, courage in facing them, intelligent optimism in planning for the future, a sense of the wisdom of laying broad vocational foundations, the need for adjustabil-

(1) Passed all subjects, one or more over 75%.
(2) Passed two out of three subjects.
(3) Passed one out of three subjects.
(4) Continued failure in all major subjects.
(5) Failure plus other maladjustment.

Scanned with CamScanner

ity, for an attitude of flexibility towards vocational life.

Dr. Paul S. Achilles of the Psychological Corporation has said that the purpose of vocational guidance is

> to show an individual the relation of facts about himself to facts about occupations and vocations.

This aptly suggests the method employed by the Tilden High School Guidance Department in directing the students' thinking on the subject of vocational choice. Vocational Guidance is not fortune telling or pulling rabbits out of a hat. Counselors do not "play God without benefit of omniscience" in this Vocational Department of Guidance, or in any other. The vocational needs of individuals can never be extricated from their psychological and spiritual, their physical and social needs.

What then has become of these 162 seekers after vocational adjustment? Realizing that, ultimately and pragmatically, we must see what the next five, ten, or twenty-five years will tell, the Guidance Department believes that insofar as it makes students conscious of the need for vocational planning on broad lines, and gives them techniques for studying themselves and occupations in relation to one another, and insofar as it creates attitudes of flexibility towards vocational life, it is succeeding in its work of vocational guidance.

IV. *Educational Problems*

The students coming for discussion of future educational plans, whether for the remainder of the high school course or for higher schools, were interviewed with a view to furnishing not only specific data concerning courses and schools but techniques for organizing knowledge and making decisions, and more especially a variety of points of view concerning possible decisions. How this has functioned in the Guidance Department at this point is not wise enough to say. And it strongly suspects that the justification must for many years to come rest on *a priori* grounds.

Twenty-eight students were individually interviewed as a special project in order to determine the advisability of recommending a correlated course in Physics and Mathematics to them for the following term. Factors besides purely intellectual ones were of course considered, in accordance with the Guidance Department's standard of viewing the problem whole. The results, so far as the correlated course in Physics and Mathematics is concerned, were as follows:

Election of course	14
Rejection of course	
1. Program difficulties, including considerations of college entrance	11
2. Lack of ability in the estimation of the counselor	1
3. Lack of interest or greater interest in another subject	1
4. Failure to report	1
Total	28

The counselors report that in five cases the student's decision was influenced by dissatisfaction with Mathematics teaching methods and attitudes which the students had already experienced.

V. *Physically Handicapped*

Sixty students suffering from cardiac disorders were interviewed as a special project to determine to what extent the Guidance Department could help with their adjustment. Fifty-one girls and nine boys were referred by the girls' and boys' Health Departments. The students were studied from as many angles as possible, for coördination of their various activities inside and outside of school, with a view to effecting maximum efficiency and satisfactions, present and future, for them.

The study was put into the hands of Mrs. Borkes, Counselor, who with characteristic understanding and thoroughness carried it through to completion. The resulting report of February 20, 1933, made to the Principal, included the following points:

> As a group the cardiacs studied are better than average students, 71.6% of them having passed all major subjects, and 87.5% of all major subjects having been passed by them.
>
> It is notable that nothing was revealed to indicate that cardiacs are necessarily maladjusted children.
>
> The Guidance Department is of the opinion that, in general, the Health Departments adequately cared for the needs of the sixty cardiac students under examination. Only five of the entire group appeared to need counsel of a kind that the Guidance Department is preëminently equipped to give. It is therefore recommended that the care of cardiacs as a group be left in the hands of the Health Departments; that the Health Departments report to the Guidance Department those students for whom there is indicated a need for advising or investigation of a type which the Guidance Department is especially equipped to give.

VI. *Behavior Difficulties*

Two hundred seventy-one of the students coming to the Guidance Department presented difficulties which we call difficulties of behavior. To measure results with them is not easy. Superficially, it might be said that many of them have been to some extent adjusted. Teachers have so reported and counselors have so estimated. Evaluation of the work with this group has not yet been attempted. The criterion of the department is the progressive ability of the individual to adjust himself to situations involving elements similar to those for which he received guidance. Temporary adjustments cannot, therefore, adequately measure guidance outcomes here. Future strains will furnish the ultimate test. Again long-term follow-up is necessary.

Scanned with CamScanner

But if relief from strain, worry, and anxiety counts; if happier, more significant life inside of and outside of school counts; if choices wisely made, and hobbies developed, and wholesome companionships formed, and home and school relationships improved—if all of these count in the lives of boys and girls, then something of importance personally and socially was accomplished by the Guidance of these students.

Relatively few of this group, two (.7%), were found to be definitely and seriously neurotic or psychotic. Outside mental hygiene clinics assisted with them, in one case arranging for hospitalization.

Mr. Burrill Freedman, volunteer psychiatric adviser to the department, makes the following statement concerning them.

> One boy has panics, obsessions, and depressions to a degree that keeps him continually out of school and dangerously suicidal. Another has states or moments at which his mind wanders; he answers questions irrelevantly, and makes fantastic statements which he does not remember and later denies.

Being episodic and still self-maintaining, these cases are not easily institutionalizable. The attitude of the family discourages or is hostile to regular outside observation or treatment. The only way they will be sure to get it is through and in the school itself.

A larger group (the number of which is not yet accurately estimated) was found to be incipiently neurotic or psychotic. Again to quote Mr. Freedman:

> These include the dangerously seclusive, hypochondriac, and schizoid types, psychopaths, and suspiciously turbulent and hypomanic trends. Even if most of these manage to get along without breaking out into overt disease, it is at a great cost of mental, emotional, and social efficiency.

But by far the largest group consists of nondescript behavior cases—girls with crushes, sexually disturbed boys, truants, cutters, bullies, class fools, students afraid to recite, seclusive students, show-offs, and so forth. What they needed was a friend rather than a psychiatrist, psycho-analyst, or psychologist. This they found in the counselor, a person with an objective point of view, as well as warm consideration, skill, and intelligence.

To tell the story of each of these would extend this report beyond the limits intended. A few summaries are offered, however—more or less typical:

R. K. represents a typical "Truancy Case" requiring Guidance. He was a handsome lad, a fellow, standing at bay between the Attendance Officer and his mother who, in a strident voice, was proclaiming that it was not *her* fault, he was just a bad boy. R. proved to be a fine type of boy, suffering humiliation from his mother's constant reminders of his "luck" in being permitted to go to school when he wasn't earning anything towards his own support. R.'s truancy was the result of his efforts to find a job. He is now attending school regularly, working after school hours, passing in all subjects and eager to join the staff of the school publication for next term.

H. L. was a gentle soul, with a high I. Q. but handicapped by a marked speech defect. His efforts to control it sometimes resulted in a high, artificial note resembling Ed Wynn's "So-o-o-o". His recitations disrupted the class and as first he was punished because the teachers thought the sound was intentional. An appeal to the individual boys in the class brought fine results. They are helping him with his work and are giving him some companionship. He will be treated at a clinic next term, although the cause of his difficulty is largely emotional. Hyman is now a "protégé" of the class and is no longer an object of continuous ridicule.

A father who left his family periodically, a mother who "always hollered," abject poverty, a figure made unsightly by masses of flesh, a thin squeaky voice, a nervous smirk which invariably convinced teachers that he was a "smart Aleck" had combined to give M. a reputation for poor conduct throughout the elementary grades. During his first term in high school he failed all subjects, but succeeded in obtaining a large number of pink "discipline cards" in addition. Aid from the School Relief Fund, medical treatment, discussion of his problems, and club facilities were made available. M. has passed all subjects this term; has done additional projects not assigned to the class; has become a stranger in the disciplinarian's office.

At the age of twelve, Ruth had attended school with seven-year-olds and, despite the age difference, they had excelled in everything but arithmetic. It was agonizing to one who had been a good student in a European gymnasium to find herself the class dunce, to be classed with these younger children, to be ignored by all. And it was certainly not conducive to self-confidence to be told over and over again, as she was told by the relatives who had reluctantly taken her in at the time of her mother's death, that she was older than the other girls in high school, that she was stupid, that she would never amount to anything and might as well leave school. Ruth began to withdraw more and more into herself, to shun the few friends whom she had, to dream in class and fail in her work. At present she is absorbed in her school work and school activities, not yet happy, but less discouraged and seclusive than she was.

What Does the Guidance Department Plan to Do Next Year?

In the Spring of 1932 Mr. Loughran approved a plan covering five years which the Chairman sent to him. The plan is presented below and it is left to those who have read this report to form their own judgment of the progress made toward its accomplishment during the first of the five years.

A Five-Year Plan for Guidance

The Guidance Office plans during the next five years to direct effort toward the following major ends:

I. Development of a greater vocation-mindedness among faculty and student body. This involves a program such as the following:
   1. Organization of a vocational committee of the faculty along departmental lines, to define vocational objectives. This to result in a student pamphlet indicating to what vocations the subjects of the curriculum point, as well as to serve as a means of educating the faculty.
   2. Individual interviews with all seventh-term students to assist them with their vocational plans, whether immediate or in the future.
   3. The contacting of as many employers as possible on a plan which will be largely determined by the vocational preparedness of the students.
   4. A series, continuing through each year, of group talks to students and of articles on vocational guidance in the school papers.
   5. Further organization of the school's placement service if economic conditions permit.
   6. Exploitation of all available extra-curricular means in the school of affording training and try-out experience to the students.

II. Orientation of first-year students and entrants from junior high school by means of systematic counseling, individually and in groups. This would be accomplished at first by an experimental approach to three or four official class groups. It would entail the use of a simple questionnaire devised to educate the student as well as to serve administrative ends, on the basis of which students would be selected for interview. The questionnaire would be preceded and followed by discussions with each group concerned to furnish interpretations and crystalize desirable attitudes.

III. Organization of a system of individual care for problem cases originating in the classrooms, involving
   1. Home visiting.
   2. Referral to agencies.
   3. Coöperation and coördination with official and subject teachers.
   4. Coöperation and coördination with advisers and other school administrators.
   5. Further preparation of forms for office and intra-office use.

IV. Devising a system for advising and helping students who fail to pass at each marking period. This might follow somewhat the lines along which Seward Park High School proposes to act — sifting the cases through Chairmen, official teachers, and finally the Guidance Office.

V. The growth, through the findings resulting from I, II, III, and IV, of:
   1. A mental hygiene point of view on the part of the faculty.
   2. Desirable attitudes on the part of students.
   3. Further wholesome recreational activities within and without the school.
   4. The habit of broad vocational and educational planning by students.
   5. An occupational and vocational library.
   6. Adequate courses in occupations.

I suggest that while this plan must develop as a whole, since no one part is totally independent of the other, we concentrate major effort during 1932 to 1933 upon I, the *vocational objectives*.

Specifically next year's plans include:

1. Follow-up of all work begun in 1932-1933.
2. Continuation of types of work already begun.
3. Enlargement of range of work to include (if size of staff permits)
   a. Gifted students.
   b. Entrants from junior high schools.
   c. Students holding high office.
4. Group counseling in the Annex which has the younger students, for whom some orientation would be practicable.
5. Coöperation with the Parent-Teachers Association, perhaps conducting round table discussions.
6. Vocational selection in coöperation with several typical commercial houses.
7. Emphasis upon work with the Guidance Committee of the Faculty.
8. Coördination with junior high schools.
9. Reorganization of testing program.
10. Emphasis upon the following needs within the school:
    a. Greater coördination with administrative offices.
    b. Further education of the faculty concerning functions of the Guidance Department. It is found that lack of knowledge and understanding, misconceptions of purpose and method, were responsible for any unfavorable teacher attitudes met—rather than basic disapproval.
    c. More opportunity for staff discussion of problems, with

Scanned with CamScanner

teacher participation where advisable.

11. Emphasis upon the following needs within the Guidance Office:
    a. Refinement of techniques of case handling.
    b. Organization of interviews.
    c. Carefully regulated follow-up.
    d. Broader acquaintance of counselors with vocational fields.
    e. Progressive contacting of community agencies—with particular emphasis upon those devoted to leisure-time use or recreation.

June 15, 1933.

REPORT OF THE TEACHER TRAINING COMMITTEE OF THE HIGH SCHOOL TEACHERS ASSOCIATION

I. INTRODUCTORY REMARKS

This report is the result of a two-year investigation of the subject of Teacher Training for Secondary Schools in New York City. The data on which the conclusions are based, includes the following:

1. A series of conferences between the members of the Teacher Training Committee of the High School Teachers Association and the following educators:

Professor Paul Klapper, Dean of the School of Education, College of the City of New York.

Professor George M. Falion, Director of Townsend Harris Hall High School of the College of the City of New York.

Professor Thomas H. Briggs, in Charge of Secondary Education, Teachers College, Columbia University.

Professor John W. Withers, Dean of the School of Education, New York University.

Mr. Tristram Walker Metcalfe, Acting Comptroller, Long Island University.

2. A questionnaire, circulated personally by members of the committee, among chairmen of departments in New York City high schools. Responses received from twenty-seven chairmen in four different schools were tabulated.

3. A questionnaire, circulated personally by members of the committee, among recently appointed teachers, on temporary license in the high schools of the city. Responses received from forty-seven teachers at five different high schools were tabulated.

4. The experience of the members of this committee as brought out in discussion at meetings of the committee.

The committee has tried not to lean too heavily on any one of the foregoing procedures for securing data. Less weight is attached to questionnaire responses than to the opinions of educators, for more thorough discussion and clarification was possible at the conferences with these gentlemen.

II. SHOULD A MORATORIUM BE DECLARED ON THE TRAINING OF TEACHERS FOR SECONDARY SCHOOLS?

The committee is of the opinion that teacher training for secondary schools should undoubtedly be continued for the following reasons:

1. Despite the huge surplus of licensed teachers for New York City elementary schools, this situation does not exist in the high schools of the city. The number of teachers now on eligible lists for high school subjects is not exceptionally large, and the overwhelming majority of these are employed as permanent substitutes. In several subjects, there is an actual shortage of regularly licensed teachers.

2. A large percentage of the students at our local colleges and universities are being trained for service in high schools outside of New York City. Standards of the teaching profession can well afford to be raised through the influx of university trained men to those other communities.

3. Even if there were few positions anywhere, teacher training must be continued to furnish new blood to the educational system. Let the best survive. Other professions are overcrowded at this time, too. There is no logic in driving all aspirants for teaching positions into other already overcrowded fields. Even a long wait for a vacancy is better under the circumstances than aimless groping in some other profession.

III. WHAT ARE THE LOCAL COLLEGES AND UNIVERSITIES DOING TO PREPARE TEACHERS FOR SECONDARY SCHOOLS?

The committee notes with satisfaction that the local teacher training institutions are trying to meet the entire problem of teacher training squarely and progressively. Great progress has been made in the past two or three years, particularly in the reduction of the number of students permitted to take the special courses that prepare for teaching and through drastic elimination of those considered unqualified. The committee learned that:

1. Practically all local teacher training institutions have an elaborate system for eliminating undesirable or unqualified applicants. Scholarship, use of English, personality and other basic requisites for teaching are adjudged by members of the Education Department of the school and by the professors of the special subjects in which the students are interested. The question of whether teachers are born or made, is, of course, relevant to this discussion. Our leading local educators felt that "Whether a teacher is born or made, training and education will make a poor teacher better and improve a good teacher." The committee agrees.

Scanned with CamScanner

2. Changes in the course of study which prepare students for teaching, such as educational psychology, methods, principles of education, etc., have been rather few except in the field of pupil teaching. Neither chairmen of departments in the high school system, newly appointed teachers nor deans and professors feel sufficiently opposed to any particular course to have it eliminated from the College School of Education nor sufficiently enthusiastic about any new course that should be introduced. Though as many as 28 of the 47 newly appointed teachers felt that the course in general methods of teaching was of "most value" among the method courses, 29 of these 47 were unable to list a single course that they would consider of "least value" among such methods courses as general methods in elementary school practice teaching, tests and measurements, and so on.

Among the theory courses Educational Psychology had the largest number of supporters (12 out of 47). The strongest objection was felt to History of Education, yet only 7 of the 47 teachers voiced such objections.

The questionnaire answered by the high school chairmen shows that the chairmen feel that the greatest shortcoming of young teachers are classroom teaching, use of English and scholarship in the order named. Of 16 shortcomings noted by the 27 chairmen who answered the questionnaire, the vote was as follows:

Shortcomings of Newly Appointed Teachers in Order of Importance

	1	2	3	4
Classroom Teaching	6	4	3	4
Use of English	7	3	8	1
Scholarship	2	8	2	6

The figures are far from convincing except that they show a trend, which the committee believes most local colleges have noted and attempted to remedy in recent years through their efforts to eliminate prospective aspirants for teaching license, on the basis of scholarship, use of English, or experience as pupil teachers.

The committee is not prepared to recommend any changes in courses at colleges with most deans, chairmen and teachers undecided or vague on the matter.

IV. Pupil Teaching

In this particular field the committee believes itself qualified to make definite recommendations. The evidence is convincing. Young teachers, chairmen and professors at the colleges agree that the system of pupil teaching needs revision and both chairmen and professors welcome the revision. The reason for the difficulty here is that the college introduces its student into a school administered by an extraneous organization, a principal and staff not responsible to the college and oftimes not coöperative in spirit. A committee of the High School Principals Association recently drew up a report on the subject which is a step in the right direction. Your committee, however, wishes to report on several phases of the subject not covered in the principals' report.

The Problem

1. There are over 40 high schools in the city, with hundreds of first assistants and thousands of teachers. To establish contact with these schools and their staffs and to obtain their coöperation is a serious problem; physically, because of their distance from the college in many cases; financially, because professors must spend many hours traveling, oftimes to observe but one pupil at school; and practically because not all high school administrators and teachers approve of pupil teachers or welcome them. The system of pupil teaching must be continued; college deans are certain of this; chairmen approve (the vote was 18 to 8 in favor in answer to the questionnaire); and high school principals agree (—"all city high schools should assume the responsibility of training pupil teachers").* Pupil teaching in model schools attached to the college is not true to life. Dean Withers of New York University disapproves of the plan of model schools, while Professor Briggs of Teachers College admits the inadequacy of this plan tried by Teachers College for many years. Model schools are expensive, besides the special conditions, the best pupils, the best teachers, small classes, and the like, that exist at model schools, make these schools of little value in training teachers for conditions in the public high schools of the city.

2. There is at present no uniformity or standardization of hours of observation, of teaching by pupil teachers, observation and reports by teachers, chairmen and college professors. There is not a uniform procedure in approaching the subject teacher, who, in the long run, does the actual training of the pupil teacher. There is little uniformity among the colleges in checking attendance or in rating the pupil teacher.

3. Some of the colleges engaged in teacher training are public institutions (Hunter, City College of New York, Brooklyn College), and others are private (Teachers College, New York University, Long Island University, etc.). New York City can by law or otherwise regulate conditions of entry, training, and so forth, for publicly owned colleges, but private institutions are more flexible in their requirements, and in addition deal with students from every section of the country.

Recommendations of the Committee

The committee believes the following procedure will eliminate many of the difficulties involved in the problem of pupil teaching.

1. Those schools which should be selected are the ones in which the principal and administration approve of the policy of pupil teaching. No difficulty will be encountered in securing enough schools.

* Report of the Committee on Pupil Teachers of the High School Principals Association of New York City, December 3, 1932.

Scanned with CamScanner

2. Those departments which should be selected are the ones in which the chairmen are definitely enthusiastic.

3. Those teachers who are temperamentally and exceptionally qualified educationally should be asked to have pupil teachers. They must also be in accord with the idea of pupil teaching.

4. Lists of such principals, chairmen, and teachers should be drawn up annually by a group such as the High School Principals Association.

5. After approval of arrangements by the principal and chairman, the college authorities should deal directly with the regular teacher in all matters affecting a pupil teacher.

6. After these preliminaries, a modus operandi must be worked out so as not to burden the teacher who thus qualifies and is desirous of doing the work. The college authorities (the deans of all the local teacher training institutions), a committee of the High School Principals and a committee of the High School Teachers Association, meeting jointly, might draw up a reasonable code of ethics and responsibility on the matter of the relationship of the high school teacher and the pupil teacher. The following is offered tentatively.

A. What the Teacher Should Do for the Pupil Teacher

1. He should consult frequently with the pupil teacher on the merits of lessons taught by either.

2. The regular teacher should observe the first four or five lessons taught by the pupil teacher for the full period. Later he may leave the pupil teacher to his own disciplinary devices for no more than fifteen minutes at a time.

3. The teacher should write out (type, if possible), a full criticism of one lesson, to be mailed to the college authorities at least once a term, together with any other reports the college may request. The chairman should not be asked to observe at all, in view of his other duties, unless he cares to do so voluntarily.

B. What the Pupil Teacher Should Do to Lighten the Teacher's Burden

1. Every time the pupil teacher teaches, the throat and voice of the regular teacher are relieved.

2. The pupil teacher may justly be asked to mark quizzes or sets of papers, after the system of marking has been fairly standardized and explained fully to the pupil teacher. The teacher should go over several papers already marked by the pupil teacher, to point out the errors of judgment in marking.

3. To maintain a spirit of cooperation and fellowship, the teacher and the pupil teacher might be allowed some leeway to work out the degree of their coöperation in other matters. Cases of abuse of pupil teachers should be reported to the college authorities and those teachers may be avoided in future assignments of pupil teachers. Attention is called to the fact that ambitious teachers here have an opportunity to acquire skill and technique in the observation and rating of teachers which can be of great help in examinations for higher licenses.

We agree with Dean Withers of New York University that, "Education is a changing temporary expedient for progress and coördination," and that we dare not fix a definite permanent plan. We, therefore, recommend that this report, particularly those sections dealing with pupil teachers, be referred to the High School Principals Association for their approval or modification, following which a joint conference of representatives of the Schools of Education of our local colleges, of the High School Principals Association and of the High School Teachers Association be held to adopt an official procedure in the matter, for temporary trial and experiment.

The committee wishes to thank the deans and professors of our local colleges mentioned in this report, for their coöperation in spending an afternoon with the committee addressing us and answering all our questions. We are grateful to the many chairmen and teachers who answered the questionnaires and to the High School Teachers Association for the opportunity to be of service.

Respectfully submitted,

Teacher Training Committee of the High School Teachers Association.

A COMPARATIVE TENSE COUNT IN FRENCH

Last year Mr. Lawrence A. Wilkins, Director of Modern Languages in the public high schools of the city, issued a list of desirable "school experiments or investigations" in the teaching and learning of modern languages. One of these was a "Tense Count." The Department of Modern Languages of the James Madison High School decided to undertake such an investigation in the form of a department project. The coöperation of all the teachers of French was enlisted.

It was thought advisable, for a more comprehensive and accurate count, to use four representative forms of reading matter. Accordingly a novel, a play, a Parisian newspaper and a book of what might be termed "popular science," were chosen. The investigation throws some light perhaps upon the following problems

Scanned with CamScanner

raised by the reading objective: (1) the time and emphasis to be devoted to a particular tense in presenting and drilling it; (2) which tenses should be taught first; (3) the choice of reading material.

The forms of reading material chosen were (1) a novel, "Colomba," by Mérimée; (2) a play, "Le Voyage de Monsieur Perrichon," by Labiche and Martin; (3) a newspaper, "Le Matin"; and (4) a "scientific treatise," "La Mer," a volume of the collection called "Encyclopédie par l'Image."

Tense-count sheets were prepared covering the ten indicative tenses, the four subjunctive tenses, the imperative, and the present participle. The imperative included, for our purposes, the second person familiar and polite forms, the first person plural ("let us——"), and the third person singular and plural ("let him——," "let them——"). The infinitive was not included since it was agreed to consider this form an item of vocabulary.

A running count was made of the occurrence of these tenses. Finally all the lists were combined and totaled. The number of times a tense occurred in each reading text is listed in the column headed "Score." In order to facilitate comparison, the scores have been converted into percentage ratings.

In Table I we have the score and percentage rating of each tense for each representative form of reading matter; in the last columns, the combined results. In Table II we have the tenses listed in order of frequency for each text and finally the combined texts. The most frequently occurring tense heads the list.

The novel "Colomba," it will be observed, uses all of these tenses, some very sparingly. The play, "Le Voyage de M. Perrichon," has over 50% of the verbs in the Present tense. This is to be expected, of course, in the dialogue form. The Past Definite, occurring at a frequency of 21% in "Colomba," is met just once in the play. In the newspaper, "Le Matin," we find the Present occurring at a frequency of 50%. It may be interesting to notice, also, in the case of the newspaper, that the Past Anterior, the Future Anterior, the Imperfect Subjunctive and the Pluperfect Subjunctive do not occur at all. A similar situation obtains in the scientific work, "La Mer," where the Past Anterior and the Pluperfect Subjunctive do not occur at any time, the Imperfect Subjunctive once, and the Future Anterior three times.

Now, if we look at Table II we see that, taken together, the most frequently occurring tenses are the Present Indicative, the Imperfect Indicative, the Past Definite and the Past Indefinite, in the order named. This would seem to raise the question whether the reading objective is best achieved by introducing the Past Definite at an early stage. The novel has influenced greatly the high position of the Past Definite in the frequency list, and this was to be expected. This tense is comparatively low in the "Perrichon" and "La Mer" lists.

TABLE I. COMPARATIVE SUMMARY OF TENSES

Tense	Novel: "Colomba"		Play: "Perrichon"		Newspaper: "Le Matin"		Science: "La Mer"		Totals	
	Score	%	Score	%	Score	%	Score	%	Score	%
1. Present	1,914	29.27	1,060	54.55	741	50.61	1,078	77.22	4,793	42.26

ROBERT BUDA,
For the Department of Modern Languages.

IN DEFENSE OF CREATIVE YOUTH

IN a recent essay published in this magazine,* a writer raises some questions which he proposes to answer, and which, based on an insufficiency of data, lead him to wrong conclusions, particularly in his major premise. He asks: Is youth creative? If it is, then why are not adults as creative as youth is supposed to be? What happens to the creative spirit as we grow older? Who kills it and how?

On the other hand, is it not possible that we as teachers have become so intoxicated with the fine results we have obtained in making youth articulate that we have ceased to be realists in this matter?

Now, these are categorical questions and require categorical answers, which Mr. Auslander does not give. Dismissing the whole proposition with the assertion that "young people are not even as creative as their elders," he limits his discussion to quotations from the poetical output of some students of his in the Literary Society of his school, and retires to his ivory tower to contemplate a "creative" scene of his own creation, content that he has laid the ghost of youthful creativeness forever and a day.

But the problem and its solution are not so simple as that. Even if we accept his definition of "creative" as that "which has been fashioned from pre-existing material into a new pattern," the statements which he makes do not follow. To say "It [an act of creation] can be done only by fully mature men and women who have abundant tools with which to reshape this material according to a crystallized purpose and vision, usually known as talent or genius," and further, that "we may . . . expect the literary output of our high school boys and girls to be imitative, emulative, derivative, critical, even cynical, but not creative," is to reveal critical myopia. For we have here an apparent misunderstanding of the creative impulse and its manifestation both in youth and in maturity. To match case for case—though the present writer intends to introduce the products of students of his as exhibits—is not the purpose of this essay. Rather is it to clarify the problem and to show that youth is the period of creativeness, and that only insofar as the elders are able to keep the youthful qualities of innocence and wonder, is their work creative.

To start with beginnings. Creativeness shows itself not only in poetry writing, but in every activity in which people engage. Thus we may have youth creative in music, in play, in manual arts, in graphic and plastic art; in fact, in anything which he undertakes, for creativeness is the rearrangement of pre-existing material

* "Poetry in Stuyvesant High School," by Charles Auslander, in the September, 1933, issue of HIGH POINTS.

Scanned with CamScanner

into something which has never been before, or, to put it better, into something which, as far as the child is concerned, has never existed before. Hence imitativeness, though not necessarily conscious, is found in the arts. For the child who speaks of "dancing flowers" or "caressing breeze" or other banalities without having heard them before is as truly creative, has as truly seen through experience to a reality, as he who first sang of a "rosy-fingered dawn." And even he who consciously imitates or uses a phrase coined by others is not a plagiarist or an imitator *in toto*, since, if his piece has emotional or imaginative realization, he has truly created something which has not existed before. What a writer of the first type needs is wider reading to acquaint him with what others have done; the second type needs only to be told that imitation is not invention, and therefore has no literary value.

So far we have limited our consideration to the writing of poetry—and we shall continue to do so in the rest of this paper because Mr. Auslander has limited his discussion to patterned verbal or linguistic creativeness. But that children are creative in every field has been attested by the experience of such men as Professor Cizek of Vienna, who shows how, because he "took the lid off," children did astonishing things in the manual and in the graphic arts; by the work of Mr. O'Toole, in his music classes in New Jersey; by dozens of obscure workers in the experimental and progressive schools here and abroad. If anybody doubts the creativeness of children at play (before they have been spoiled by the plethora of mechanical toys that glut the market and the home), let him watch a child or children at play with but a few sticks or stones, or rags, or any available object.

Is youth creative? Youth, until strait-jacketed by the old-line disciplines, is creative in everything it does until we teach it decorum and the amenities, because these, to us, are the easiest ways, the ways we understand, the ways in which what follows is predictable.

We were told that youth, in its poetry, is imitative. We have just seen that from a truly serious viewpoint, they are not. They are no more imitative than their elders who, attempting to speak of love or nature or hate or revenge or adventure, gave voice to songs which needed a "barbarie yawp" to remind a gloating world that it was tinsel on which it was gazing; that it was a clock-cuckoo to which it was listening. Yet no one will deny that there were poets in the nineteenth century—not great poets, yet poets, *makers* of song and music.

Then we are told that high school boys may be "emulative, derivative, critical, even cynical, but not creative." Mr. Auslander surely has heard of the "American Wordsworth," the "American Tennyson," the "American Browning." He must have thought of "Mourning Becomes Electra" in connection with its Greek ancestors. Even the Immortal Bard himself leaned on his contemporaries, Marlowe in particular and his predecessors in general, so heavily as to justify the gibe that he wasn't original; yet nobody in his senses would deny that the personages implied the factor of creativeness. For derivativeness itself does not preclude the creative ability. It is a sound principle of criticism that it is not the subject, but its treatment, that makes a work of art in any field. And that treatment must be purely personal and individual. If a child be permitted to handle his theme in his own way, provided, of course, he has something to say and has the ability to say it, his product is no less unique than if it had never been attempted before—and uniqueness is essential to creativeness.

To give to youth a "critical" ability or a "cynical" one, while denying it creativeness, is to give a tree branches before giving it roots, if to criticize is to evaluate and to be cynical is to devaluate. For really to criticize is far more difficult than really to create; they are, of course, two different abilities, the one demanding insight, intelligence, or reason, the other intuition. The creator intuitively gets at "the essence of experience" and interprets it beautifully; the critic, jumping the intuitive step, contemplates the product and sees it in its relation to the whole of life. (By critic, of course, we mean the *judge*, not the formulator of opinion.) The critic, then, is a philosopher, a lover, hence, a "knower" of beauty; but beauty is only a part of wisdom. To say, then, that youth may be critical but not creative is to honor and flatter it, but it hardly helps in understanding it.

This writer happens to believe that young people can be taught to write verse, to paint, to model, to compose, provided they are normal and are taught early enough by the proper teachers. That Mr. Auslander's experience has been disappointing is probably due to its not being broad enough. We, too, have seen in high school literary journals pieces that by no stretch of critical sympathy could be termed poems. Yet that does not mean that these journals could not have had them or can not have them. It may be that they do not know how to get them; but to say, on the basis of a narrow and local experience, that creativeness among youth does not exist, is to fly into the face of too great a wealth of contradictory proof to indicate discretion. For whatever a poem is, it is not that by virtue of the age of its composer, but by the intensity of its emotion, the splendor of its imagination, the realism of its invention. Children do not lack any of these factors. Though they may lack breadth of experience, they do not lack ability to interpret experiences within the limits of their comprehension. It is when we get poems on love from a pre-adolescent, poems on nature from a child who has never seen it except in a city park, poems on life from one whose experience with it is limited to that vicariously gained from reading, that we are likely to get the ill-conceived, imitative, derivative pieces with which Mr. Aus-

Scanned with CamScanner

lander's article is adorned. And that, of course, is the fault, not of the child, but of his teacher. Why should a student want to write a "Thirteenth Idyll," indeed, if not for a medal or for publication? Surely Mr. Auslander will not deny the title of poet to Hilda Conkling, to Nathalia Crane, to Tom Prideaux, to the author of "Renascence," to the writer of "Thanatopsis"? If these were only "on their way" when they startled a literary world, then nine-tenths of the poets whose work fills anthologies and slim-backed volumes have not even gotten under way. A poet grows by the breadth of his experience, in the richness of his reaction to it, not in intensity of emotion, in imagination, in honesty. If a child is a poet, he is one by virtue of what might be called the "poetic temper," which can be developed. Lacking that, he is not a poet. He is not a poet who shows promise. He "must have arrived" in order to be one.

Youth, then, is creative. If that is so, then why are not adults as creative as youth is supposed to be? That is our second question. Instead of saying that adults are not so creative as youth because youth is not creative, thus cleverly knocking a straw man down, we will examine mature life and see why it cannot be. Any artist will testify that creative work requires time. Markham's one per cent of inspiration and ninety-nine per cent of perspiration is no journalistic catch-phrase. Time, leisure in which to do the actual labor of writing, painting, composition, sculpturing; the peace and quiet necessary for concentrating; reading and study—all these are the gift of only a relatively chosen few, for the terrible pressure of economic necessity, the goad of social expectation, the attitude with which the creative worker is still largely regarded (the moon-struck, ineffectual, starving, unsuccessful individual), the level of our cultural *mores*, our mad emphasis on material achievement (measurable only in dollars and cents), these are some of the shafts that mow down the creative spirit. Getting a job, making a living, raising a family, keeping up with the Joneses, dissipating and draining our intellectual and emotional energies in insane work and in madder play, these choke the creative urge. It is only those among the chronologically mature who keep their childhood wonder and delight at nature and experience, to whom living is a perennially new adventure of breath-taking discovery, who can withstand the eternal pressure for material success; it is these who keep alive the creative spirit and are our poets and creators of beauty.

What happens to the creative spirit as we grow older? Who kills it and how? The creative spirit becomes diffused, is lost, is sublimated in the scramble for security that reaching adulthood entails. Just as acquisitiveness may be made to function in the piling up of wealth in whatever form, or in gathering culture; just as pugnacity may become bullying, or sympathy for the oppressed, so may creativeness become mature artistic expression or sink to the level of

vicarious thrill-seeking. The former being denied to most of us by the exigencies of our existence, we seek speed and speakeasies, the emotional paralysis of the movies, the catharsis of prize-fights and wrestling matches, the tame thrill of baseball, the barbarity of football. These, we believe, are our outlets for dammed-up creativeness. Thus is our emotional impasse compensated.

As for the final question—realists, we take it, call a spade a spade, and do not take credit for doing so. Though poetry to be poetry must be articulate, articulateness is not poetry. To be a poem (or any other work of art) a piece of work, as implied above, must be emotionally and imaginatively realized. It must be based on experience. It must be honest and sincere. None of the trappings and trimmings of poetic, figurative language, rhyme, even recognizable rhythms, to mention only a few—are essential. Yet these latter, because of their obviousness and authority, give the stamp of "poetry" to much student effort which is that only by gracious courtesy. And the fault is not the students', rather it may be laid to the lack of a critical faculty among these who guide the destinies of aspiring, youthful poets, who judge wrongly not only the work of their charges but that of professional (by which is meant published) poetry as well. Lacking perspective or principles of criticism or both, ignorant of what poetry is (as are most poets themselves who know only what it does or should do), teachers praise (sometimes for encouragement) where adverse criticism would be most salutary. But this does not mean that youth is not creative, for creativeness does not lie in the path of poetry alone, nor that the young could not write poetry if properly guided. This only means that the criticism is bad or faulty, and the "critic" wrong, not that the child is lacking what may be called "a second nature."

To this reader, at least two of the poems published by Mr. Auslander were real poems, having the qualities enumerated above, plus the integration of these elements which is greater than their sum, and which make poetry — "Valleyward" and "The Ruthless," by Alexander Epting. The others are not creative, not because they are derivative or imitative, but because they fail to have that integration, "that beauty and love which is the daily food of paradise."

I append these poems by members of the Creative Writing Course at the Samuel J. Tilden High School without comment, precisely because they are emotionally and imaginatively realized, are sincere and honest, and are based on experience. If all our students are not capable of such work, it is because we have not the talent to draw them out, or because we did not get to them early enough.

Disillusion

Softly beam your eyes on me,
  As when at some late hour,
The Moon through veiling cloud peeps forth,
  A great, grey, lonely flower.

And, oh, so softly does your hand
  In silence seek mine own;
While o'er around us has a veil
  Of grateful silence grown.

Scanned with CamScanner

So kiss me, dear, and silence keep,
And on me hold your eyes;
For then I leave the earth beneath
And soar to Paradise.

But you must never speak, my dear
For if one word you utter,
Your pedestal beneath you falls,
And leaves you in the gutter.

—*Max C. Norman.*

Poem

Our house still stands,
Where it stood before;
Nothing there is changed,
Except that there is dust on the floor.

You and I are still
Just as we were before;
Before the house of our beings,
There is still a locked door.

And like our real house,
I suppose, if I found the key
That I have now ceased searching for,
There too, I would find only dust on the floor.

—*Esther Milder.*

Rain

It was good to feel the rain against my face, washing my powder off.
I thought of us as two human beings, whose individualities were hidden in a maze of powder.
I wished the rain would drip into our souls and wash it off.
Then I looked into the mirror and I saw my skin was shiny and my nose an unbecoming red.
I was glad, then, that the rain could go no deeper.
For our souls might look quite scrubby and old without their covering.

—*Esther Milder.*

Sonnet: "Organ-Voiced Milton"

Hence, a vain, deluding Milton! to thy door,
A right good round of mischief's to be traced:
With powerful, ungifted hands thou hast
Essayed to learn the jeweler's trade; wherefore,
With wond'rous patience, adding score on score,
A host of brazen Titans didst thou cast;
Thy weighty pudding of poetry doth taste
A mite too floury, needing kneading more.
But seriously, my lad, it may have been
No fault of thine; perchance, howe'er uncouth
It sounds, the Lord did on thee stage a joke,
And thou wert born, if thou getst what I mean,
Not with a silver spoon, as are some folk,
But with, instead, an organ in thy mouth.

—*Max C. Norman.*

Truth

You said you did not fear my wit,—
In fact, defied it, dear;
Then why so anxious as you read
These verses here?

Perhaps you fear that on this page
I'll slur or slander you?
Then fear not: Truth can slander none;
And what you fear is true.

—*Max C. Norman.*

Memo

When that occurs, don't weep for me
Too much;—or plant above the heap
A bowlder to my memory.

Just fix the thing for rest and sleep,
And cushion me through decay;
And,—oh yes! rig up a radio,
To fiddle the worms away.

—*Max C. Norman.*

Sonnet

Yes, I write lyrics;—not the gushy kind,
That late-houred ladies in lounging robes peruse
So languidly, and yawning, turn and talk,
Between the cigarette puffs, of dress and men.
Nor like those semi-dreamsprites, faced with chalk,
Do I enshrine a perfume-tipsy pen,
For filling the school-girl's mother-haunted mind
In secret, with seditious, daring views
Of chaste, illicit love. And yet I wish
Most for the middle pathway. I don't care
To grunt of butchering hogs and vending fish.
Neither alone is truth. I banish these;—
As one forgets the broken, leafless trees
Forlorn and dead, in ancient Union Square.

—*Max C. Norman.*

The Gods

To whom shall we pray?
The Gods do not speak
From where they sit,
Each in his divinity.
We'll pray to the God of Laughter
To send us mirth for which
We cannot pay,—
But our Gods never listen,
They are too busy arranging clouds
For the different seasons,
And making notes of all they have not seen
And mean to, when the next century
Comes crawling upon the legs of adolescent time.
Some day the Gods will lift their wooden faces
And totter from their thrones
Calling upon us to save them.
But we, too, will be busy—seeing new things!

—*Lillian Moskow.*

Poem

I thought that as long as I made you happy
And filled your life with laughter and song
You would stay in the valley with me,
Content . . . . .
But then I found you gazing at the distant hills.
I said, "Go my dear,—the valley is too low for you."
And you went, and I stood in the valley, and watched you go.

—*Eva Honigman.*

Mutation

As one who, workworn, rests his head on hand,
And, sleeping, dreams again forgotten dreams,
Then wakes to find them yet again forgot;
So through Time's haze, I seek to understand
My purposes, and scrutinize what seems
My former self, and find I know it not.
God! when I think of that unnoticed drift,
Its present bearings and its future course,
And feel the eddy-streams within me now,
As yet untried and torpid but as swift
As ambushed silence and with greater force,—
Then when I think where they may carry me,
I like to hope that some day I may grow
A bit more like the way I used to be.

—*Max C. Norman.*

Wise

So silent, blushing, and demure,—
She sighs to me;
So glib, original, and sure,—
She lies to me.
For histrionics of high degree
I give the prize to her;
And yet, she lacks the wit to see
I'm wise to her.

—*Max C. Norman.*

AN EXPERIMENT: INVESTIGATING THE DEPRESSION, OR WHY IT IS CALLED DEATH VALLEY *

It is a stretch of territory some hundred and forty miles long and fifteen miles wide which, in ages past, sank to a depth of 310 feet below sea level. On either side tower mountain ranges to heights of from six to eleven thousand feet.

I had read about this inferno in southeastern California, famed in literature from the days of '49 on. I became literally "fired" with ambition to see it and to test the truth of its gruesome reputation and of the seemingly exaggerated reports of its exalted summer temperatures.

Perhaps my diary will best carry on the story.

August 13

This day starts shortly before 5 A. M. When and where it will end, I don't know. I am and have been

* Mr. Cole has spent many of his summers visiting the most notable physiographic and geological features of the country—Editor.

Scanned with CamScanner

"stuck" for the last six hours in the middle of Death Valley with no help in sight, the thermometer breaking altitude records and the nearest human being six miles away at Stovepipe Wells, a trek to which place I shall not attempt until after sundown and hope to end by moonlight. Here's how! (Note the date. It's not Friday, anyway.)

Pursuant to plans I arose at 5 A. M. Breakfasted and had lunch put up and with final instructions from Peterson, George's partner, I started out. (Carrying plenty of water and food, thank goodness!)

Made and crossed Panamint Valley all right and also slowly negotiated the 5,200 feet of Townsend Pass grade successfully (eight miles up, twenty down) over the Toll Road. At Stovepipe Wells in Death Valley came the first intimation of trouble. I thought my starter had "jammed," but the only inhabitant discovered that the trouble was a "short" in the starter.

He got me started by pushing and told me he thought I could find a mechanic at Furnace Creek Inn, twenty-three miles ahead, but on no account to kill my motor until I reached there. I knew enough for that, but six miles out ran into some sand and, of course, the motor had to stop—at 10 A. M. So, here I am and likely to stay until my walk in the moonlight. It is now 4:15 by my watch. I hope my watch is slow.

All day I have been trying to keep my mind off my serious predicament by doing everything I can think of. First I read a magazine I happen to have along. Then I bring my diary up to the minute. Back to the magazine, trying to forget the blistering hot breeze as it whistles through some of the scrubby mesquite bushes. This is the hottest time of the day in the Valley and were it not for this unexpected breeze, it would be stifling. I try to sleep, but without success. I have to shift continually to keep out of the rays of the moving sun. I happen to remember there is a can of grape-fruit juice in the car. It will help pass some of the time to open and mix this with my drinking water. The result is highly satisfactory.

I have with me six gallons of drinking water, enough to last me a couple of days if I stay in the car. But if help should not come, these seething days will have sapped so much energy I will not have a chance to walk to safety. No, the moonlight walk is the best bet!

Now is the time to jot down the few necessities I can take with me when I cut loose. Here is my list: flash light, two-quart thermos bottle, keys, glasses and my one remaining sandwich. Am going to force myself to eat the other just before I start. I have no appetite. How am I to carry these things? In six miles they'll weigh a ton. Why not place them in the collapsible bucket? Is has a broad handle and should be fairly easy to carry. The shadow of the car lengthens on the sand as Old Sol prepares to slip below the Panamint Range. The mountains are beautiful

in the setting sun. I cannot resist snapping a couple of pictures of the peaks called Panamint and Funeral (ominous name).

But now the sun has dropped below the rim. I look at my watch. Just six o'clock. I ought to make it by midnight. Until then I will have the light of the full moon. After that nothing but the flash. Carefully checking off the items on my list, I prepare to depart. Two quarts of water are all I can carry. Well, I will allow myself a drink only at the mile posts. My last act before starting, an identification slip from a page of my notebook. Well, here goes, Mr. Moon. I see you're waiting patiently for our promenade together.

Locking the car and taking a firm hold on the bucket, I step briskly off on the highway. Like fun, I do! I shuffle off into the ruts, depending on a slow steady pace to pull me through. Almost immediately I find myself plodding through sand, not the easiest surface to walk on, by any means. Well, I did not notice much of it on the way out so I guess I'll be out of it soon. Now the car has disappeared and darkness has fallen, but my friend, Mr. Moon, lights the way.

It is neither swelteringly hot nor cool but a parching of my tongue tells me the temperature is at least in the upper 90's. Slowly I push along. More of that sand. Where does it come from? I don't remember seeing it this morning. Well, I've got to get out of it sometime. No drink until the first mile post. Will it ever appear? I keep shifting the bucket from one hand to the other and realize I could never have done without it.

At last, a patch of white which grows larger as I move forward. Always forward, I resolve, no backward step on this trip. The black and white sign grows distinct—"Stovepipe Wells Hotel, 5 Miles." I look at my watch —forty minutes for the first mile. Not so bad. Well, Mr. Moon, one-sixth of the distance. Another mile and it will be one-third, another one-half and—but, not so fast. Let's have a drink. I pour the cap of my thermos full and let the lukewarm liquid trickle down my parched throat. My tongue doesn't feel quite so large.

Shall I rest a while? No, I'll get drowsy and forget to arise. Not five miles from my goal. Get up, you, and go on. From my seat at the roadside I slowly raise myself and, staggering a bit at first, resume "speed."

On to the second lap. Now the road becomes covered with loose rock and the going increases in difficulty. How about another drink? No, sir; at the next mile-post. Do you want to run short? If that happens, pick out the little pile of rocks beneath which you will rest in peace, if human hands reach you before the vultures do.

On, on, on, surely they must have moved that four-mile sign. Eight-thirty and no white patch yet. Well, what of it, you're always going forward. Forward, that's the heartening thought. The sand has now almost entirely given way to loose rock and I am suspicious a blister is forming under one of my big toes. Forget

Scanned with CamScanner

it. What was it that Hunter said this morning about the water at Stovepipe being so salt? Well, salt water is the best thing in the world for tired aching feet. It will be the first thing I'll ask for if I reach the hotel. Stop that "if" business, you dumb-bell. Are you a quitter?

A sign? Well, this mile was certainly longer than the first. Never mind, a third of the distance gone. But that means twice as far to go. Stop thinking of that and move on. Are you still with me, Mr. Moon? Well, you said a drink. All right, but don't waste time. Let's have one more look at the sign. No, it can't be true! "Stovepipe Wells Hotel," not four, but three and a half miles!

Yes, you may give three conservative cheers. Gee, that's encouraging. No wonder it seemed so long. Surely, the next one should be two and a half miles.

O. K. for a drink, but no prolonged rest now. Keep moving. Each time it becomes harder to get up. Now it's rocky, now it's up grade, but always on, on, on.

Now for the next marker; will it be three or two and a half? Guilty of a secret longing to see it two, but not daring to hope. Surely, I've covered more than half a mile so it can't be three. It's going to be two and a half. What time is it? 8:10. My watch is my only means of gauging distance as I figure my pace has been fairly uniform so I should now be on my way to the two and a half mark. The blister is doing famously, but remember the salt water at the end of the road. Yes, another drink is in order, don't you think, Mr. Moon?

That two and a half marker is a long way. Perhaps I'm going slower. Never mind, you boob, you're going forward. Surely, from the next rise I'll be able to see the patch of green that marks the hotel, even if it's a couple of miles off. But the next rise simply fades into a similar one, and now alarming symptoms begin to develop. For a while back I have felt a slight twinge of cramp in one foot, but have scarcely dared to think of it.

Now the muscles of both legs begin to be unmistakably affected. I am still, at the very least, two miles from home and a let-down now would be almost certainly fatal. I sit down for another drink and the cramps become acute, doubling me up. I simply must walk them off. Rubbing my legs vigorously, I rise quickly to my feet and swing into step before I have time to think about it. I stagger momentarily, then plunge on.

And now a new thought enters my mind. A lusty shout at frequent intervals will cost me little effort and might possibly reach Hunter's ears at the hotel, although I'm sure he must be asleep. Eight-forty by the watch. I let out a whoop which would turn any Indian green with envy. Only the breeze answers. I notice with some concern that the light wind appears to be blowing away from the hotel. I have long since ceased to think of my tortured feet and am plodding on mechanically, but always forward.

Whooping it up as I stumble along with my companion, Mr. Moon, looking down with apparent approval, I derive only lung exercise. There must be no more signs. Well, the longer they delay putting in their appearance, the less mileage they should indicate when they finally come into view.

As I keep my eyes fixed ahead, I spot something some distance away. It looks like a grove of trees, but I can hardly believe that my eyes are not deceiving me. Were it in the daytime, I would swear it must be a mirage. For trees on the desert almost always mean human habitation. I am convinced, at last, that the hotel cannot be very far off. I double and redouble my shouts, still to no avail. Well, if I can't make the hotel, at least I will be where they'll be sure to see me in the morning.

Now pushing ahead almost blindly I shout lustily once more. A sound! A voice! "I'm coming!"

Down I sit in the middle of the road. A light flashes. I hear a car start, and down the road comes a pair of gleaming head-lights. I still have strength to take out my watch. It is just 9:15. Only three and a quarter hours for those tortuous miles! What you can do when you're fighting for your life! Well, we won, Mr. Moon. Good-night to you.

Sympathetic hands soon helped me into Hunter's Chevrolet and we drove the few remaining yards to the hotel while I kept asking only for a cabin and a tub of salt water. More ready sympathy came from Mrs. Hunter, a charming lady, as they both told me how concerned they had been about me ever since I left the hotel. In fact, in the afternoon Hunter had driven four miles out on the road, and there I was stalled at six! As I thought, they had been sound asleep and had not heard my shouts until I turned the last corner.

A large tub was soon filled with warm salt water from the well and it's a wonder I didn't step into it shoes and all. Boy, it felt good. Hunter emptied my thermos and filled it with some of their cool water. "Only a couple of cupfuls were left in yours," he said. I must have been drinking without being conscious of it, for I remember only four or five occasional drinks. I was told it had probably been not 120° but 130° out where the car was and that a month ago I could never have accomplished the walk as it frequently remains well over 100° in the Valley, even at night. "Indeed," said Hunter, "the margin between stark tragedy and safety in your case was very narrow." And I readily agreed with him.

I spent the remainder of the night alternately sleeping and making visits to the tub of soothing water.

Here endeth a Memorable Day.

Why do they call it Death Valley? I almost found the answer.

HIGH POINTS

Ideals to be Realized in the Growth of Boys and Girls

As the Resultant of the Educational Forces in the High Schools of New York City

1. The Will to Perfection. That he have built up the will to do and the resulting habit of always doing as well as it can be done by a person of his capacity whatever seems to him worth doing to that degree of excellence.
2. That he have acquired effective methods and habits of work. The capacity for prolonged intensive effort, intelligently directed to the realization of a clearly defined objective.
3. That he have gained the power and habit of analysis. The habit of arriving at decisions on the basis of evidence accurately evaluated.
4. That he have acquired critical-mindedness as a constructive attitude toward life, the want of which in American life is largely responsible for corrupt and inefficient government.
5. That he be open-minded, intellectually sympathetic; aware of his mind sets; able to review his convictions with a view to a revision of his own judgments.
6. That he be tolerant, realizing that every one, by virtue of the fact that he is a human being, has something in his experience that is worth while to another. That he be not only willing but eager to get the other person's point of view and therefore willing to credit the other person with honesty of conviction; and, as the outcome of this attitude and practice, that he develop the power and habit of finding the best in other people.
7. That he have the courage of his convictions; the intellectual and moral courage to carry into effect a decision intelligently arrived at. Courage to follow the truth when once it is seen.
8. That he be dependable; that having once taken upon himself a trust, he will discharge it no matter what disagreeable experiences may be entailed.
9. That he possess a highly developed imagination and rich emotional responsiveness to rich emotional stimuli, with an appreciation of the beautiful in music, in the representative arts, in Nature, in literature, in speech, coupled with the moral obligation to realize it.
10. That he have a habit of reflection, creating in him humility and reverence.
11. That he possess a respect for craftsmanship and a joy in his own craftsmanship as the outcome of the cultivation of at least one creative activity.
12. That he be intellectually curious, possessed of an inquiring mind which carries him constantly into broader, deeper, richer fields of experience and which results in growth in the diversity and intensity of his abiding interests.
13. That he be possessed of a sense of obligation to continually realize and live up to his utmost capacity and thus create a capacity for endless growth.
14. That he have achieved a sense of freedom as the outcome of a long course of discipline and evolved from discipline from without to complete self-discipline.
15. That he be no longer an individual but a person, a man who has learned to live in a social group, a man with a highly developed spirit of coöperation who possesses the ability to put himself in the other person's place and not to take for himself an undue share of the social product, a man willing to accept social obligations in proportion to his capacity; socially adaptable.

JOHN L. TILDSEY,
District Superintendent
of High Schools.

The Founding of a School Art Gallery and Museum at the James Monroe High School

James Monroe's Art Gallery grew out of a series of blundering attempts by the writer to decorate suitably the halls and walls of the school building. Satisfactory results might perhaps have been obtained with less waste of effort if we had had from the first a clearly visualized plan of action. But the very vastness of the problem, such an enormous amount of uninspiring wall space clamoring to be decorated all at once, made the task seem futile and discouraging. Maybe the final resolve to convert the building with its blocks of halls and walls into an art gallery that runs from the ground floor up to the top, was not exactly the great idea of the century, but even so, it was surprisingly slow in coming, and when it finally took hold, the school was five years older.

The difference between a plan for mere school decoration and a planned school museum is a difference between decoration applied to the surface of a structure as an afterthought and one in which structure and ornament are integrated from the very first, where function and beauty are one. For a museum is a part of the functional purpose for which the building was constructed and is just as much an organic part of it as its desks and its classrooms.

Once this is granted then the form that it shall take is completely controlled by this fundamental purpose: "Form follows function." This is axiomatic in art parlance. It proves as safe a guide in organizing a museum as it does in the designing of an automobile, or the construction of a bridge or of an office building.

As mere decoration, the material gathered is an end in itself, but as a museum it becomes part of the school's curriculum, linking up with literature, the social sciences, the classic and for-

Scanned with CamScanner

eign language studies, and, in fact, with practically every subject that is taught.

Thus on the main floor, history reveals itself in the monumental sculpture of Egypt, through giant-sized photographs, taken from the originals at the Metropolitan Museum of Art. I have seen a young teacher of history discuss them with some of his pupils. They evidently recognized in Queen Hat-shep-sut and King Thutmose old friends come to life. Then again, on the main floor, to the left, as you enter, Medieval France presents the ardent expression of her "imagiers" who so naively and so skilfully breathed into the stone the spirit of their age. There in the centre, as you enter, Michelangelo spreads before you his individualistic concept of the "Creation," the original prophets and Sybils of which adorn the Sistine Chapel. The Parthenon, the Pyramids, the Cathedrals of Cologne and Chartres, the Taj Mahal, all tell their various stories of beauty and of a bygone humanity.

On our walls mingle and gossip the patrician nobility of Venice, the merchant princes of Florence, the burghers of Holland, the cavaliers and tavern roisterers of Frans Hals, the strong and rugged Dutch and Flemish peasants and dwarfs, jesters and Infantas of Spain. All this is on the main floor.

The second floor is a history of the art of painting. On one side of the building, on the left, the Italian, French, German and Russian Primitives tell in pale enamel-like colors mixed with gold, with an infallible feeling for architectural design, the deep piety of the age. Then swinging from the left toward the centre of the building are those transitional expressions of periods and lands which bridge the past with the present; and then comes the right wing, which is devoted to the Moderns, idolized by some and anathema to others. Here the scientist combines with the artist to achieve new forms in color, and the archaeologist and the student of African and Indian art initiate the modern world into the art of the jungles.

Space does not permit me to give in this brief sketch a very detailed description, but I hope that the reader will supplement this with a visit to the school, where a catalogue may help give a fuller appreciation.

For me, personally, the gathering of this material was in the nature of a great adventure. It is true that it meant and still means much work, but it is also work in self-expression, which is always pleasurable. The search brought me into book shops and print shops, and old curiosity shops, to rug dealers, to museums and to art galleries. We combed the markets of Europe and America for our material. Then came the mounting, framing, organizing and the hanging. Ambition did not confine itself to art alone, but reached out toward the sciences and to literature. Perhaps in time the sciences will be as well represented as the arts.

I feel grateful to the James Monroe High School, to its halls and walls, for standing by me so patiently while all this was happening, to the General Organization for its great generosity, and to Dr. Hein, the Principal of the school, for his constant encouragement, sometimes amounting to almost a push.

Da Vinci said, "The more we know the more we love," meaning, no doubt, that interest and appreciation grow with knowledge. And again, "The painter who draws by practice and judgment of the eye without the use of reason, is like a mirror which reproduces within itself all the objects which are set opposite to it without knowledge of the same."

The above thoughts might well apply to the works displayed in our school. It will take time for true appreciation to develop, daily contact alone is not sufficient, true appreciation comes from knowledge and reflection combined, if possible, with some effort at creative self-expression. This will place an additional responsibility upon the members of the Art Department, but it will also place at their service a wealth of art material possessed, at present, by few, if any other, similar schools in the world.

I read recently of a report on character education, prepared by a committee of the High School Teachers Association, that will shortly be published. In the brief account given in the newspapers of this report English was ranked highest of the subjects taught as an aid to character development, with history, civics, biology, health education, music, mathematics, and the sciences following. I saw no mention of the so-called "Fine Arts." Let us hope that they will be included in the fuller report, for the arts are objectified expressions of the very souls of the peoples of the past, and a Greek column of marble or an Egyptian statue of polished granite are not only things of permanent beauty, but they are also complete expressions of an outlook upon life by the respective civilizations which produced them.

MAX S. WILKES.
James Monroe High School.

The Educational Value of Typewriting

It is true that the "educational values of any subject are those values which are consciously striven for in accordance with a definite teaching plan." It is also true that not only must the teacher be conscious of these aims, but the pupils themselves should be made aware of them.

To begin with, can we in the initial stage of teaching typewriting bring out any abilities that are educational for the pupil? I am inclined to say that we can because of the very nature of the process of learning to typewrite.

Typewriting is a neuro-muscular adjustment. The nervous system must be so organized that the stimulus presented to the eye must quickly find a response in the hand. Not only must we set up these responses, but they must be made mechanical and automatic. Now it is through this fact, the making of these responses mechanical and automatic, that we get our opportunity.

Scanned with CamScanner

It doesn't take the pupil very long to realize in learning to typewrite that concentration is necessary. He soon finds out that in trying to initiate, direct, and control the correct sequence of finger movements required to make a series of strokes, that this function is absolutely essential. We are thus setting up habits of concentration and attention.

Again, in attempting to avoid wrong responses and develop resistance to distractions, the ability to inhibit is being gradually formed, and we can make a point of the value of healthful inhibitions to the pupil.

All the time the pupil is practicing, he is forming the habits of position, of location, of the sense of touch, of the different reaches of the fingers. The development of these simultaneously is a great factor in motor-coördination. And right here I wish to say that the mental hygienists claim that orderly habits of concentration, attention and motor-coördination are some of the essential factors in mental hygiene which make for the integration of the personality.

Surely we are developing habits of exactness and precision since it is only through exact habits that skill of any kind can be developed.

These are some of the habits we try to emphasize in the habit-forming stage of learning to typewrite. If we turn to the intermediate stage, after the responses have been made automatic and we begin to apply the typewriting technique, we are able to present to the pupils a great mass of information concerning the details, operations, and background of the business world. Through the copying of letters, he becomes familiar not only with the various forms but the different types of letters used in business.

The typing of business forms such as checks, invoices, telegrams, and monthly statements, opens up further information and insight into business transactions. Legal papers, contracts and documents carry this on still further. I don't think it is necessary to stress the educational value of all this information.

There is a third phase that I should like to touch upon. We can make an attempt to stress certain character traits in connection with the typewriting. In the earlier stages, if we notice any pupil making many errors in typewriting, we can say to the pupil, "Here is your chart of errors. Analyze them; pick out the ones that are recurring. Here are the corrective remedial exercises. It is your job to undo these bad habits and form correct ones." We are thus placing the responsibility on the pupil himself.

Again in the advanced classes, we can combine the isolated skills in the form of problems and leave it to the pupils to use their initiative and their creative ability to carry the task through to a finish. "You are the stenographer for such and such an employer," we say to them. "Your employer has just finished dictating these four letters to you. Here is your supply of paper. Typewrite these letters using the correct form and correct size paper." In following a lesson of this sort with a class or group criticism of the results, we are developing discrimination and judgment. Again in assuming this employer and stenographer relationship, we encourage the habit of listening closely to instruction, and the ability to grasp and carry out instruction.

Finally in the Type 4 term, we can arrange for some group work. The dictation in that grade is grouped around central themes such as travel, insurance, invention, investment and banking. The class is divided into groups, each under a chairman. One of the topics is presented to each group. It is the business of the group to organize and gather all illustrative material, data, information, consulting the teacher and the library, if necessary. The group conferences for the organization of the work are held in class. The chairman may call other conferences either in class or after school. When the time for the dictation of the topic presented to a group comes, that group puts up all collected material on the bulletin board and gives a little talk to the rest of the class concerning it. Then follows the dictation on that topic.

It is in some such manner that we try to tie up the different skills so that they bring out and encourage character traits.

M. Coltillette.
Walton High School.

The Library as the Laboratory of the School

As the high school library has evolved from a few books in the hallway or in some obscure corner of the school, it has grown so quietly that often even the teachers have not been conscious of its value and of its possibilities for service. There have been many conceptions and many misconceptions of the purpose and the achievements of the school library. In an article which appeared in the second series of "School Library Experience," Miss Helen Harris of Knoxville, Tennessee, has stated the purpose of the school library as follows: To lead children to love books and reading; to teach them to supplement their studies with other than textbooks; to train them to use the public library intelligently. It is this second objective, Miss Harris says, that keeps the librarian with her nose so close to the grindstone that she is in danger of forgetting everything else.

In the library of Julia Richman High School, we have deliberately chosen this second and least glamorous objective and have aimed to make the library a laboratory where the pupils may find the necessary material for research in every subject of the curriculum. More truly, it might be said that this objective has been set for the library by the school, for in the final analysis the course of a school library which really functions must be determined by the faculty of the school. The high school library must follow the aims and plan of the school and all its aims and plans must seek to supplement and fulfill those of the school rather than to develop separate standards of its own.

This laboratory at Julia Richman is equipped with books, pictures, maga-

Scanned with CamScanner

zines, newspapers and clipping files. The book collection is small, far too small for the number of pupils who must use it. Even before the days of the depression the library allotment was totally inadequate, and since the depression it has been reduced to an impossible minimum. Yet a pupil was heard to say that it was the best library in the country, and it probably is for her, for in it she may readily find the books which she needs. The collection has been carefully selected. It has been built up from the recommendations of the chairmen of the departments and every book has been chosen to fill a definite need of the classroom. Probably because of the very necessity for careful selection the library has a small but workable collection of books for every subject of the curriculum.

Pictures are a very important part of the equipment. These are designed to serve the very practical purpose of helping the classroom teachers to demonstrate certain facts or to enable the pupils to visualize unfamiliar objects or scenes. The pictures are mounted on plain cardboard with an effort to make them straight and true, but with little emphasis on the beautiful.

Pamphlets and all such material as may be obtained free or at a small cost are collected in the vertical files. Here may be found such material as the pamphlets issued by the publishers about the authors whose books they publish. There are state and Federal documents on flowers, insects and other subjects of interest to the science classes and bulletins and pamphlets from the business houses which are valuable to the history classes. Probably the most popular feature of this laboratory is the clipping file. A daily bulletin is made of the newspaper articles which are most interesting and most pertinent for the classroom work. From these articles those of special interest are selected. Sunday newspapers, discarded magazines and any other source of current material are searched, and all such matter as seems to correlate with the class work is selected. These articles are mounted on cardboard with a stapling machine and are classified according to the "Readers' Guide" indexing. With a small list of newspapers and magazines, the equipment of this laboratory is complete.

The science teacher using the science laboratory knows her pupils and sets a definite problem for the class. Very different is the laboratory problem for the librarian. In the Julia Richman High School the library receives some 150 or more pupils each period and they are each day a different 150 with 150 different problems. The librarian thus meets in one day more than a quarter of the school's enrollment. During the school day the library admits only those pupils who have definite need of the library for reading or preparing assignments from library books. Text-books are not admitted to the room, not because there is a grave objection to their use, but because the library could not accommodate all who would come. In this laboratory the assignment is the problem to be solved and often the librarian must interpret the assignment before she can recommend the material for solving it. The assignment is made by a teacher who thinks that she has made it absolutely clear and simple and has taken the precaution of having it copied into a note-book. Perhaps it is characteristic of the adolescent period, or it may be merely human nature, to ask for an indefinite thing when a very definite thing is desired. "Where are the non-fiction books?" the librarian is often asked. After some questioning it is disclosed that the teacher has assigned an English or an American essay or some very definite type of book. A number of pupils recently requested a map of a transcontinental railroad which proved difficult to find, yet on questioning the teacher the librarian learned that she had merely requested the class to find the names of the terminal cities. A request for an "under the bridge dictionary" is easily interpreted and is quite characteristic of the type of mistake in which the pupil hears incorrectly. Often the assignments are copied incorrectly, but more often they are given correctly on mimeographed sheets and are misinterpreted by the pupils.

When the librarian has correctly interpreted the assignment, she may proceed to advise the right book or other material for preparing the lesson. Theoretically the librarian should send the child to the catalogue and thus encourage her to do independent work, but time presses and there are always four or five pupils awaiting the librarian's attention. Each problem is new to the librarian and she must therefore check the index before she can safely recommend a book. Another question may lead to the magazines through the use of the "Readers' Guide" and the librarian must pause a moment to explain how this index is used. Even when a familiar problem gives her confidence that a certain book may be advised without further checking, the librarian often will find that the pupil will return it with the complaint that it does not have anything on her topic. This happened recently in the case of Beard's "American Government and Politics" which was given to a pupil for the topic, "The Flexibility of the American Government." The girl found it unsatisfactory because she had looked up the topic in the index and not finding it, was convinced that the book could not help her. The average girl of this age is very literal-minded. If the book does not say exactly what she wants or what the teacher has asked for, she will reject it.

If the library is to achieve any lasting results, it is not enough that the daily lesson be prepared. The pupils must be taught to do independent work and they must be prepared to use books in their college work or in the public library, if high school is the end of their formal education. With this in mind, it has been the policy of the Julia Richman library to encourage independent work as far as possible. Reference books may be consulted without the formality of

Scanned with CamScanner

signing for their use, and the pupils are allowed to browse around and seek their own materials. They are left to their own devices until they ask aid or show that they are not able to find the necessary material.

Pamphlets, clippings and picture files may be freely consulted. The pupils are merely requested to return all such material to the desk to avoid misfiling. It is true that often clippings disappear, sometimes because they are carelessly put back in the files and sometimes they are deliberately taken, perhaps to be presented to the teacher as evidence of original work.

In order to train the pupils to use this laboratory, a series of six lessons is given by the librarian in coöperation with the English department. Through these lessons an effort is made to teach the pupils to use the card catalogue, the "Readers' Guide," the index and other parts of a book and a few general reference books. When books are torn or stolen, when the best clippings and books disappear and when at the end of the period papers are left on the tables, the librarian may wonder what this laboratory is teaching the pupils. Yet she may pause in the middle of a busy period and watch the pupils as they quietly and intelligently consult the catalogue and find their own books on the shelves, as they select the right volume of the encyclopedia or use the "Readers' Guide," and she may feel confident that the library is a real part of the educational system. The library of the Julia Richman High School is essentially a practical, work-a-day unit. It endeavors to help the classroom teacher to teach better and to help the pupils to learn better. Yet if this were all the library achieved, it would be true, as Miss Harris has said, that the librarian's nose is so close to the grindstone that she can see only that which is right close to her. But the librarians of Julia Richman High School believe that the other two objectives are not in the distance but are really present. They feel confident that a library which can inspire these young people with the faith that it is ever present to help them in their daily lessons will lead them, through the use of the public library, to a love of reading and good books. Surely in these days when we are looking forward to a time of greater leisure, no greater boon can be given to the children of today than the love of good books and the ability to use libraries to find them.

VERA ELDER,
Librarian.

Julia Richman High School.

The Mathcraft Society

A new club, "The Mathkraft Society," has been formed at Abraham Lincoln High School. The purpose of the club is to study the applications of mathematics and to construct mathematical models and machines.

Thus far some of the members have constructed some very interesting objects. One boy made a pantograph (a machine for reproducing a given diagram on a larger or smaller scale). Another made a Peaucellier linkage (a device for drawing a straight line by means of circular motion).

A third member made a working model of Napier's rods (a device used by Napier in the early days of mathematics to facilitate multiplication).

Other members have constructed models to illustrate the more difficult theorems of Geometry and the variation of the functions in Trigonometry.

Some of the things the club expects to consider are:

1. The investigation of the relation of mathematics to optical instruments and mirrors.
2. The construction of a sun dial.
3. The construction of machines with which to draw ellipses, hyperbolas, conchoidas and other curves.
4. The construction of homemade transits, sextants, and other instruments and a study of their use in map-drawing and surveying.
5. The study and construction of calculating machines.
6. The construction of graphs, charts, and models to be used by the teachers of the department in their classes.

In some cases the work of the club will be correlated with the shop work of some of its members. Otherwise most of the objects will be made at home with simple materials.

SAMUEL H. BARKAN.
Abraham Lincoln High School.

Shop Talk

The foundation of Vocational Education, Industrial Arts, Manual Arts, Art Craft, or what have you, is still in the process of construction. The movement has its roots deep down in the educational philosophy of Comenius, Rousseau, Pestalozzi and Froebel. It was first introduced into the United States via the Centennial Exposition at Philadelphia in 1876, and in the last twenty-five years it has gained considerable momentum.

The chief objectives are to instill a taste for and love of work in general; to inspire respect for rough, honest bodily labor; to develop the sense and love of order, exactness, cleanliness and economy; to cultivate perseverance and the power of concentration; to promote general dexterity; to train and develop the perceptive, analytical, constructive and inventive faculties; to develop and strengthen the body and to cultivate the esthetic sense.

To do all this for the pupils is more effective than any other educational system of manual training, because it aims to interest these pupils, adapting the exercise to their mental and physical ability by means of careful methodical progression, and producing a useful article as a result of this work.

In this industrial age, it is our problem in education to teach safety and accident prevention in its various forms, help to develop habits and attitudes which are more effective than mechanical protections.

Scanned with CamScanner

The seven cardinal principles of secondary education are applied to the shop as well as to the entire educational structure.

1. *Health.* Pupils become familiar with occupational dangers, health hazards, occupational safety precautions, health possibilities in selection of a vocation, and conservation of strength through manual activities.

2. *Fundamental Processes.* An insight is gained into actual life outside the school as well as application of related work, such as mathematics, correct speech, physics and so forth.

3. *Worthy Home Membership.* The shop develops ability and resourcefulness which will function for all in making repairs about the home, and in appreciating skill and labor to the fullest measure of serviceability.

4. *Vocation.* The pupils acquire skill and ability, serve society through vocation; appreciate the value of vocations to the community, and discover their interests in manipulative activities.

5. *Civic and Social Education.* Coöperation for the general good and a realization of the relationship between various vocational groups are taught.

6. *Leisure Time.* The pupil learns about manipulative activities, experiments, special readings, observation and the enjoyment of the products, and performances of others. He also develops a love for that which is beautiful and a desire for artistic, appropriate and harmonious surroundings.

7. *Ethical Character.* The shop develops habits of industry, responsibility for a task, ethical integrity of the worker as shown in finished projects and valuable personal traits.

In conclusion, teacher, if your patience in the incessant struggle with fickle and light-headed youth begins to give out, remember the patient endurance and faith in mankind of Comenius, Rousseau, Froebel and Pestalozzi and you will renew your strength, confidence and love in your pupils again.

JOSEPH GREEN.

James Madison High School.

Course of Study in Literature at the Abraham Lincoln High School

("The motto must be: 'Learn to act with and for others while you learn to think and to judge for yourself.'" —JOHN DEWEY.)

LITERATURE

The study of literature is planned so that it represents a gradual development from the simple and juvenile to the more complex and mature, a progression of interest from external to internal conflict, and from physical to psychological action. It is thus hoped that the course may become one in human and social behavior as well as in literature. If through class discussion of literature a pupil does not gain a greater insight into human nature (and ultimately into the complex workings of his own nature), a more realistic understanding of social problems (and ultimately those that face him and the world in which he lives) or a greater knowledge of the materials with which to evaluate or formulate ethical concepts, then he might just as well stay at home, read his books, and write good old-fashioned summaries of their contents.

In working toward these aims, let us encourage honest difference of opinion (even when these opinions differ from our own) and cultivate an inquiring mind that is willing to suspend judgment; but let us discourage intellectual arrogance and an attitude that is merely controversial.

In the course of this social and intellectual interest, we must not forget that literature is an art form and that appreciation should continue to receive a major emphasis, especially in poetry. A modern English teacher must have enthusiasm and courage, enthusiasm for the best in literature and courage to treat realistically and critically the worst in social evils.

TERM I
Men in Action
(Adventure and the Sea)

TEXTS

1. Treasure Island, The White Company, *or* Call of the Wild.
2. The Ancient Mariner and Sea Poems.
3. Short Stories of Various Types.

SUPPLEMENTARY TEXTS (for slow groups or as additional reading for normal groups)

1. Adventures of Tom Sawyer.
2. Playing the Game.
3. Stories of Adventure.

LITERATURE

The appeal this term is mainly to the interest in action, although pupils should learn to evaluate character and motives through speech and action. This character study may be very elementary, merely requiring pupils to apply adjectives to persons read about and to justify these adjectives by specific references to the story.

Ethical concepts that may well be stressed include: courage, kindness, loyalty, independence of spirit, perseverance of spirit, idealism, etc.

TERM II
Men and Supermen
(Heroes of Legend and History)

TEXTS

1. The Odyssey.
2. Up From Slavery.
3. Abraham Lincoln (Drinkwater).

SUPPLEMENTARY TEXTS (for slow groups or as additional reading for normal groups)

1. Myths and Their Meaning.
2. Heroes of Progress.
3. Modern Pioneers.

LITERATURE

The appeal this term is to the pupils' interest in heroes, past and present, classical and national. Character study should become more analytical than in Term I. The qualities that make for greatness, the obstacles that confront man, the possibilities for service to mankind, the times of which these men are an essential part should be stressed. In this term pupils should get some idea of Greek customs and beliefs (mythology), of Negro life and liberation, and of Civil War problems. The Greek simplicity, love of beauty, and imaginative power; the Negro's humility, persever-

Scanned with CamScanner

ance, and childlike faith; the simple dignity, humanity, and solid virtues of Lincoln—all are worthy concepts which may be developed.

TERM III

Man and His Neighbor

(Insight into Human Nature)

TEXTS

1. Silas Marner.
2. Merchant of Venice.
3. One Hundred Narrative Poems, *or* This Singing World.

SUPPLEMENTARY TEXTS (for slow groups or as additional reading for normal groups)

1. Oliver Twist.
2. One-Act Plays of Various Types.

LITERATURE

The books of this term may be unified by the study of man's relation to his neighbor, both in the evil and the good he can accomplish. The study of characterization this term should probe more deeply than in English II. Understanding of motives behind men's actions, whether good or evil; weighing the conclusions at which they arrive, and condemning or justifying the attitude of society toward them, should be the focal points of the discussion. These books cannot be taught without emphasizing the need for tolerance, sympathy, and better understanding among people and the stupidity of prejudice, desire for revenge, and reliance on chance to settle one's problem. Even "One Hundred Narrative Poems" offers opportunity for this type of treatment if the selections are based on a unifying theme or emotion.

Worthwhile enrichment may come through a study of Shakespeare's theatre and times, of rural England in the nineteenth century, and of the historical and geographical setting of many of the poems. If properly handled, the text thus becomes more clear and vivid.

However, detailed biographies of authors, background information that has no bearing on the problems involved, or long, boring reports should never be given.

TERM IV

Man and His Voice

(The Power of the Spoken Word)

TEXTS

1. Tucker's or Goldstone's "One Act Plays."
2. Yesterday and Today.
3. Reference: Better Speech.

LITERATURE

The books of this term were selected because they are especially adapted to work in Oral English. The plays offer opportunity for oral discussion of the problems involved, both technical and ethical, as a preparation for effective classroom dramatization. The aim should always be to develop intelligent, imaginative reading, not the delicate nuances of professional acting.

The poetry of this term, if properly motivated, should introduce the pupils to a new world, rich in emotion, imagination and beauty. The four major appeals of poetry should be stressed:

1. To the ear (music).
2. To the mind's eye (vivid pictures—imagination).
3. To the heart (emotion).
4. To the mind (thought).

Poetic comparison (simile, metaphor, personification) should be taught as aids to vividness and not as formal exercises.

TERM V

Man and Society

(Problems of Human Conduct as Seen in Man's Clash with Society)

TEXTS

1. Tale of Two Cities.
2. Galsworthy's *or* Barrie's Plays.
3. Modern Biography.

LITERATURE

The unifying theme of these books is the struggle of the individual against the forces set up by society. Characterization here demands a more analytical study of man, both as an individual and as a member of a social group. Power is frequently accompanied by abuses—the majority is not always right. Therefore, the importance of approaching social problems with an open mind, an inquiring attitude, and suspended judgment must be stressed. It will be found that such worthwhile concepts as patriotism, duty, loyalty, democracy, justice, success and the like need re-examination and re-evaluation. Such discussions ought to give pupils a greater interest in and a more intelligent attitude toward the problems that face the world today.

Worthwhile enrichment may come through the study of the French Revolution, but it should be approached from the human rather than the historical point of view, from the modern implications (abuses of power, corruption, etc.) rather than its dead issues (dates, taxes, etc.). The plays and biographies offer interesting incidental enrichment, but supplementary details about men's lives and background have no value unless they have a direct bearing on the problems involved.

TERM VI

Man and His Emotions

(Problem of Human Conduct as Seen in Man's Clash with Himself)

TEXTS

1. Macbeth.
2. Idylls of the King.
3. Schweikert's *or* Knickerbocker's Short Stories.

LITERATURE

In this term, the texts all picture man's struggle with himself. Characterization here should probe more deeply into the complicated workings of man's soul. Pupils should begin to question and to understand the forces within man which make him act as he does; to recognize that character is cumulative, not a static thing; and to realize that emotions and desires, while they may lead to successful attainment of our ideals, may also, once out of control, lead to disintegration of personality and failure. Even the Short Stories, if the mature ones are selected, offer opportunity to evaluate motives, emotions, desires, and their far-reaching effect on human lives. Pupils may thus be made to understand why we all behave like human beings.

Enrichment may come through discussion of the limitations that the Elizabethan Theatre placed on Shakes-

Scanned with CamScanner

peare's art and of the necessity of catering to a tabloid audience with its love of the supernatural, the bloody, and the spectacular. Recognition of Arthur as a Briton warrior, dressed in the romantic trappings of chivalry by Malory, and furnished with Victorian ethics by Tennyson, may serve as an interesting example of the evolution of a legendary figure. However, any Medieval or Elizabethan research of an occult nature, any background study which does not vitalize the material, any purely technical approach (the technique of the short story as a literary form or the diagramming of action in a play) should be avoided like the plague.

Term VII
Man and His Mind
(The Power of Reason)

Texts

1. Hamlet.
2. Lincoln's Speeches *or* Burke's Conciliation *or* Landmarks of Liberty.
3. Essays Old and New.

Literature

The work of this term consists largely of an analysis of man as a thinking being and the reconstruction of his personality as revealed through his thoughts. In Hamlet we see the process of clear thinking vitiated by a lack of emotional balance, by an extreme sensitivity which makes it impossible for him to cope realistically with the problems that face him, and by a tendency to rationalize his difficulties in terms of personal desires. In the essay, we come into contact with writers who take us on excursions into a wide variety of fields of thought; they may be whimsical or serious, trivial or important, but always we recognize them as the reflection of vibrant personalities. In the speeches, generally, we follow the application of thought to the solution of critical problems; here we see clearly the characteristics of logical thinking: a complete grasp of the chief issues involved; the selection, arrangement, and presentation of pertinent and authoritative material; the drawing of conclusions based on definite proof, leading to a plan of action the best possible under the circumstances. Such study should stimulate an interest in present-day social and political problems, train pupils in applying logical method to their solution, and develop a humanitarian and social point of view through the discussion of basic principles, as true today as they were in Burke's and Lincoln's time.

For enrichment in connection with Hamlet, see suggestions for Term VI. Discussion of Elizabethan beliefs regarding purgatory, suicide, Christian burial, ghosts, revenge, and so on, may help to clarify situations in the play. The biographical notes in "Essays Old and New" should be used with caution, only as a means of throwing further light on the personality of the essayist. In connection with the speeches, it will be necessary to devote a lesson or two to background study of the crisis. This should be developed in terms of the problems of the period most closely connected with the speech and not as a history lesson on the American Revolution or the Civil War.

Term VIII
"Reading Maketh a Full Man"
(Literature as an Interpretation of Life)

Texts

1. Twelve Centuries of English Poetry and Prose.
2. The Return of the Native, Ethan Frome.
3. Ibsen's Plays.

Literature

The anthology was chosen for this term's work because it gives the teacher an opportunity to teach what he is really enthusiastic about and because it enables the pupil to orient himself in the stream of English literature and to drink deeply. However, this does not mean that the course should be either a survey of English Literature or a disjointed, haphazard sampling that lacks any continuity. Lessons should be planned as units, beginning at the level of the pupil's interests (story and drama) and progressing to the great lyrical and philosophical poems of the major poets. In order to conform to the city's syllabus and possible college entrance requirements for pupils, it will be necessary to include the following in planning for the term's work:

1. A series of at least six essays. ("Of Studies," "Ned Softly," "Old China," "A Piece of Chalk," "The Medieval and Modern Workman," "Eldorado," offer variety, interest, and worthwhile themes.)
2. A unit of major poetry. (Milton's "L'allegro" and "Il Penseroso" or the poetry of Wordsworth, Shelley and Keats.)
3. The sonnet. (Its form; a generous sampling from the great sonnet writers.)

To the human and social values which have been emphasized throughout the high school course and which should still be stressed, may be added appreciation of the beauty and power of language and imagery. The material is rich in possibilities of assisting pupils to re-examine and re-define old ideas and ideals, to vitalize and integrate them into a philosophy of life that can function.

Hints to Inexperienced Teachers

1. *Need for Planning*

The teacher should be prepared to *teach* the lesson, not be merely acquainted with the material. Such preparation requires definite planning and should include ideally:

(a) Specific goals toward which the lesson should move.
(b) Motivation to arouse interest and relate material to pupils' own lives.
(c) Orientation—helping the pupil to place himself in the situation and to identify himself with the problem.

2. *The Importance of Good Questioning*

If the teacher cannot, through questioning, elicit the responses necessary to the development of the lesson, the recitation, no matter how well-

Scanned with CamScanner

planned, will be static and ineffective. Good questions start discussion, allow for difference of opinion, focus attention on important points, and direct the development of the lesson as a whole. In general, the "why" or problem question and the "you" or identification question (used discreetly, of course) are the most valuable types. Large topical questions precipitate discussion, integrate the material, and centralize the development of the lesson. Questions to which the teacher does not know the answer are often the most stimulating and provocative. Avoid the yes-no question, the fill-in-the-blank, and the leading question.

3. *Effectiveness of Following the Discussion on the Blackboard*

Such summaries or analyses serve not only as foci of attention during the discussion and pegs for further discussion, but also as means of preventing repetition and as an aid in summarizing at the close of recitation.

4. *Enrichment through Teacher Contributions*

(a) There should be incidental introduction of interesting, pertinent material drawn from the teacher's wider reading, experience and keener awareness.

(b) The teacher should train himself to read aloud effectively, especially poetry.

(c) The teacher should supply additional related material in the form of newspaper clippings, short poems which present similar ideas, or anything else that will make of the study of literature not a digging into the text (erudition) but a digging out toward new horizons (culture).

An Experiment in Vocational Guidance

We have been conducting at Walton an interesting experiment in the field of vocational guidance.

It was suggested that the social studies and commercial studies departments of Walton High School hold a series of conferences. As a result of our meetings, the following conclusions were reached:

1. That a desirable and happy young citizen can best be formed by early placing in the hands of the high school pupil information concerning the power to earn his livelihood.
2. That an early study by the high school pupil will assist in arousing his interest and creating such power.
3. That a high school graduate should have practical information concerning various phases of industry, from a utilitarian standpoint.
4. That this information will aid to his cultural development as well.

It was decided, therefore, to formulate a plan based on vocational, utilitarian, and cultural aims.

The assignment of the writer to conduct this experiment was evidently dictated because of his long teaching experience and business experience, as well as his interest in vocational guidance.

The material was at hand. The well conceived course in Elementary Business Training provided such material. Bearing in mind that our main purpose was vocational guidance, I rearranged the course somewhat. Herewith is the general outline used:

Week	Subject
1	Retailing Neighborhood Store
2	Retailing Department Stores Chains Specialty Shops Mail Order Houses
3	Wholesaling
4	Manufacturing
5	Selling
6	Selling
7	Advertising
8	Advertising
9	Credits and Collections
10	Money and Banks
11	Investment
12	Foreign Trade
13	Real Estate
14	Printing
15	Hotels, Restaurants, Tea Rooms
16	Service Industries
17	Amusement Industries
18	Trades
19	Professions
20	An Individual Graph View

As a means of preparation for this work, a Business Club was formed last Spring by the Department of Accounting with the writer in charge. He planned and executed club visits to local organizations, the activities of which were afterward discussed. Since there existed no text to convey the outline in the order indicated, it was necessary to prepare one. Thus equipped we were ready to proceed.

A second term class [illegible] study Civics Two was provided, 73% of whom had had one term of Elementary Business Training, which provided the foundation for this work. Uppermost was the question as to whether the subjects to be taught were beyond the scope of this class. Illustrative material was provided in abundance.

The following methodology is employed:

Each Monday is devoted to motivating a new subject and to its development through questioning. Assignments for the week, covering various phases of the industry are given to a number of students and discussions held regarding methods of finding material for the execution of these assignments. No homework is assigned, but each student is held responsible for original research in the subject under discussion, the results of which are incorporated into their note-books. These are examined every Friday, and form a very important element in this work. They are neatly kept and contain, in addition to notes, illustrations, diagrams, and clippings bearing on the week's work. At the end of the term, they will be put into book form and may be consulted by students of succeeding classes.

Tuesday, Wednesday, and Thursday are devoted to a detailed study conducted by the students and directed by the teacher. The procedure consists of reports of investigations and interviews, the reading of reports based on research, dramatization, and discussions.

Scanned with CamScanner

The results to date have been gratifying. The students are receiving preparation for their life work. The pupils are keenly interested. They are learning how to stand on their feet in front of an audience and discuss business subjects freely. They take great pride in the appearance and content of their note-books. The pupils are rapidly learning, mainly through their own efforts, the basic elements that comprise the various phases of industrial life.

Has this course influenced any of these students in the choice of career? I believe it has. A census taken at the beginning of this term disclosed that work in stenography and typewriting was practically the unanimous choice. A similar investigation on November 23, 1932, about two months later, resulted in the following selections:

Interior Decorator	1
Secretary	12
Actress	2
Nurse	1
Specialty Shop	1
Law Stenography	1
Designer	1
Buyer	2
Journalist	1
Chemist	3
Social Service	1
Stylist	1
Columnist	1
Salesgirl	1
C. P. A.	1

Most of these choices can be ascribed to the broad industrial vista opened to these students, by which they realized that there exist tremendous industrial opportunities for which their high school work provides excellent preparation, especially work in such subjects as stenography, typewriting, elementary business training, accounting, arithmetic, and law. The experiment thus provides them with a further incentive towards proceeding with these subjects.

It might be of value to those interested in this subject to note the ground covered in a week's assignment. Under the heading of "The Retail Shop" the following were taken up:

1. What is a Retailer?
2. Functions performed by the Retailer.
3. Analyzing the market.
4. Factors deciding the kind of goods to be sold.
5. Where shall the Retail Store be located?
6. Starting business:
   Lease, fixtures, insurance.
7. Buying for a Retail Shop:
   What, when, where, and how much to buy.
8. Buying sources.
9. Methods of purchasing for a retail store.
10. Merchandise characteristics
11. Retail selling (briefly).
12. Vocational opportunities in Retailing.
13. Qualifications necessary.

It was found that the commercial activities of the students' relatives, friends, and neighbors are the source from which had been formed an apperceptive basis for the pursuit of the topic. It was no more difficult for them to master this material than it was to comprehend any other general or commercial subject. They were powerfully motivated by the idea that retailing was something which touched every phase of the home life of their families as well as of themselves, and the subject was therefore approached with great interest.

Factors which equip the teacher for this type of work are:

1. A considerable amount of business training.
2. Weekly visits with students to industrial organizations.
3. The use of sound films that illustrate everyday commercial life (or activities).

Walton High School.

A Class Constitution

The inculcation of pupil self-government is one of the aims in a civics class. To achieve that objective one should do everything to promote a civic consciousness and a spirit of community feeling.

At Haaren there appeared a group of boys who seemed to have a little more than usual of the social consciousness in them; hence, the promotion of pupil self-activity, a description of which follows.

The teacher proposed that the class govern itself. What would be more logical than to have a class constitution? Thus the problem of creating the document. The boys decided to do the job. Certain suggestions were made by the teacher. The boys decided to appoint a committee to draft a constitution. After the draft was submitted to the instructor the boys decided to perfect the instrument. As a result of their second meeting the following document was drawn up.

This organic law of the civics class was carried out to the letter and promoted a great deal of discussion in their weekly forums, discussions and even trials. The boys did everything themselves and a better model of pupil self-government and self-activity is still to be produced as a result of the experiment.

Constitution of Class II in Civics

Preamble

We, boys of Class II do establish this Constitution for the conduct of our class in Civics.

Article I

A committee called the program committee shall be elected by the class to arrange a program for the Friday recitations. The committee shall consist of five boys. They shall meet immediately after their election and shall choose one of their number as a chairman.

The committee shall hold office for one month.

Article II

Work of the Committee

The committee shall arrange the program for the class. They shall meet from time to time and draw up the desires of the committee for use on Fridays. These wishes shall be presented to the teacher on Wednesdays of each week. He shall have the power of approving or disapproving

Scanned with CamScanner

any of the suggestions of the committee.

The committee shall select a chairman and a secretary for each meeting. The committee shall select a new chairman and secretary.

The committee shall select one of the members of the class to act as a permanent secretary.

Article III

Duties of the Committee Chairman

The committee chairman shall represent the committee in talks with the teacher. He shall also be the one to announce to the class the topic or program for the Friday meeting. Such announcement is to be made on Thursdays.

The committee chairman shall have full control over the meeting as soon as it is in session. The chairman shall start the meeting promptly on the ringing of the jingle bell. Should no jingle bell sound the chairman shall begin when it should have sounded.

The chairman shall introduce the topic chosen. He may make a short speech introducing the topic.

The chairman shall have the power to recognize all speakers. He shall follow reasonable rules. He shall call upon all who wish to speak. He shall also see that the same boys do not do all the talking.

He may ask a speaker to sit down who he feels is unprepared. He shall have the power to make reasonable punishments for such boys.

The chairman shall also be the one to maintain order. He may make reasonable punishments of any disorderly boys. The meaning of what is reasonable shall rest in the committee. Any one having complaint shall complain to the committee. The teacher will back up the committee. The teacher shall have the power to change the punishment.

Article IV

Duties of the Secretaries

Each secretary shall keep an accurate report of the events of the meetings. He shall, after writing up the minutes legibly, give the minutes to the permanent secretary who shall keep them on file.

The permanent secretary shall hand the previous minutes to the one who made them. He shall hand it to him at the new meeting so that they may be read and corrected.

Article V

Removals and Resignations

Any member of the committee can resign whenever he wishes.

The only one that can remove the chairman of the committee is the class and the teacher.

If the class wishes to replace the chairman of the committee or a member of the committee it shall be done by a two-thirds vote.

The signatures of nine boys and the reasons for removal must be filled out before a vote can be taken for removal.

The accused shall pick one of the members of the class to defend him before the vote is taken.

One of the nine boys who signed the petition shall present the charges.

Article VI

Miscellaneous

The committee, and every pupil, shall address the chairman presiding as Mr. Chairman. The teacher shall do the same.

The members of the committee go out of power as soon as the chairman has called the Friday meeting to order.

Any one addressing the club must recite in paragraph form.

The members of the committee may be chairmen too.

Article VII

Amendment

Any amendment to this Constitution may be added by a majority vote of the members present after a petition shall have been passed around. This petition shall contain the proposed amendment.

Finished the third day of March, 1933.

EDUCATIONAL NOTES AND ANNOUNCEMENTS

Annual Science Fair for Children

The American Institute, in announcing the Annual Children's Science Fair, has officially invited all of the school children of the city to submit entries. Any child or group of children in the city, under eighteen years of age, is eligible to compete. Last year the Institute accepted 478 entries, representing the work of some seven thousand children.

A special section has been formed this year for Junior Science Clubs. "This is the one really important change of policy we have made in many years," stated L. W. Hutchins, Director of the Institute. "Last year," Mr. Hutchins explained, "The American Institute began to form a junior branch because it felt that science clubs of young people, of which there are thousands throughout the city, should be given encouragement and help from an adult scientific body. The special entry class has been provided at the Fair for these junior science clubs as a part of the Institute's work of encouraging the club type of progressive science education."

In addition to the new Junior Science Clubs group there will be the usual entry classes for school groups and for individuals. Entries will be submitted in ten different subject classifications as follows: Stars and the Solar System, Earth Studies, Plant and Animal Life, Biology, Physics, Chemistry, Health, Conservation, Industries and History of Science.

Cash prizes will be given to the winners of first, second and third places in the different subject classifications. The Institute stipulates that these prizes must be spent for science, gardening or nature equipment, or science books. Last year more than two hundred prizes were awarded, amounting to some $2,500.

The Institute will hold the Fair, as in previous years, in Education Hall

Scanned with CamScanner

of the American Museum of Natural History.

Dr. Morris Meister is the Chairman of the Executive Committee for this year's Children's Science Fair. Other members of the Executive Committee are: Mrs. Grace Fisher Ramsey of the American Museum of Natural History, Mrs. Doris Spier Harman, Dr. S. Ralph Powers of Teachers College and Dr. John M. Arthur of the Boyce Thompson Institute for Plant Research at Yonkers.

More Psychology!

In the March, 1933, number of HIGH POINTS Mr. Joseph Block, in his article, "A Viewpoint for Psychology," takes exception to that one by Mr. Joseph B. Fish wherein the viewpoints of the various schools of psychology were presented in an unbiased objective manner. Mr. Block would have personal recommendation.

It shall be attempted here to refute the individual captious interpretation of subjective psychology, the evaluation of introspection and the recommendations of Mr. Block. In addition, so that the nature of this critique be not totally destructive, conclusions will be suggested which may occasion a less purblind attitude.

No objection need be taken to the presentation of the two systems. These are facts which may or may not have been set forth accurately. They may, however, be verified in any good history of psychology.

Yet, active opposition is aroused by Mr. Block's evaluation. It is as one-sided and as subjective as any work on scientific method should not be. He says, in part, that introspection is "delightful" and literary. But to employ it in psychology is inane. Hence, ". . . it is high time for psychology to jettison this whole lumbering cargo of the objective school," thinks Mr. Block.

James Mark Baldwin, in "Dictionary of Philosophy and Psychology," many years ago stated in his article on the introspective method: "The introspective method is essential to psychology. . . A main advantage of the method of experiment in Psychology is that it gives opportunity for introspection under test conditions. Some psychologists may be called introspective in a special sense, because they make more exclusive use of the method than others. . . But no psychologist *ever* confined his procedure to mere introspection. It was always more or less supplemented by inference (necessary even in natural science) from resulting products to producing processes and by observation of the manifestations of mental processes in other minds."

Mr. Block continues in his article to evaluate objective psychology which is based upon experimentation and observation and he concludes that there is but one viewpoint possible—objective psychology. He states: "Human action is reducible in *every case* to this formula" (stimulus—response). Is this not pure unadulterated nonsense? Is Mr. Block not too naïvely credulous in his expectations? Does he really think use of the terms *behavior, stimulus* and *response* will

solve all the inherently difficult problems of understanding human conduct? Does he believe, to use his own words, he "can *interpret* the most elaborate life situations in terms of stimulus and response"? Or is he attempting the sensational?

Even Professor Arthur I. Gates, an objective psychologist, in his "Elementary Psychology" (1928), raises the question whether all the facts which may be useful in describing the behavior of man or animals can be observed in the objective way. It is apparent—and if it is not, see William James' "Varieties of Religious Experience"—that there are many activities and experiences in human life, at least, that are limited entirely to one person. No one can share these observations; no one can verify them. Hence, ought they be denied?—for they cannot be recorded by mechanical devices.

R. H. Wheeler, in "Science of Psychology" (1929), writes: "A knowledge of human behavior is incomplete so long as there is no information available concerning such processes as thought and feeling."

Mr. Block believes introspection is a detriment to psychology as a science. However, medical practice relies upon introspection for diagnoses. Professor Morris R. Cohen, in "Reason and Nature" (1931), writes: "We can recognize that it is impossible to exclude all reference to conscious experience in the study of human physiology. We can see this in works like Sherrington's 'Integrative Action of the Nervous System' and the older studies of brain physiology [illegible] those of Brocca and Flechsig. . . On the other hand, any psychology which is more than a dialectic development of introspective data must include physiologic knowledge. But psychology even of the behavioristic kind uses social categories, which distinguish hand-shaking and hitting from muscular contraction."

Perhaps here is the key to the matter—a school of psychology which employs observation and experimentation and yet does not deny introspection. Such a school is Gestalt psychology. Here a distinction between introspection and observation is sheer flummery. R. H. Wheeler says they are co-essential and recognizes no conflict. That the Gestalt psychologists experiment and observe there is no doubt. The names Köhler, Koffka, Wheeler and Ogden suffice.

Mr. Block makes some wild stabs at Gestalt psychology, which may be indicative of the fact that he was not certain of his field here. He is an *objective* psychologist. Mr. Block takes particular objection to "insight." On this score Professor Cohen, in the same book on scientific method, writes: "The history of science indicates rather that fruitful hypotheses have generally come to certain gifted minds as musical themes or great poetic expressions have come to others; . . . it has enabled one gifted with fortunate insights or guesses to develop them into successful scientific hypotheses."

Professor Cohen also writes in another sections of the book, ". . . and

Scanned with CamScanner

the behaviorists have not yet advanced any single hypothesis as to human behavior which has proved a stimulus to fruitful investigation."

It is not the scope of this article to present more fully any particular viewpoint on psychology. It must be left to other articles and to the readers themselves.

However, before concluding, a final objection to Mr. Block's article must be raised.

Habit formation is of particular interest to the teacher. Mr. Block writes: "Objective psychology . . . considers learning as habit formation. It does not need satisfaction and dissatisfaction, pleasantness and unpleasantness. . ." It may be that Mr. Block has been too long a teacher. It may be that the writer is yet too close to the pupils' bench he warmed so many years to have entirely forgotten satisfaction and pleasantness in his learning processes. Ask any pupil, ask any practical teacher (not a psychologist), whether satisfaction or dissatisfaction and pleasantness or unpleasantness for *either* pupil *or* teacher play any rôle in learning! Perhaps Mr. Block would become cognizant of the facts despite the unpleasantness.

In this relation Dr. Abram Lipsky, in "Man the Puppet" (1925), writes: "That children like to study if they like the teacher and make no headway if the teacher repels them; that the subject is identified with the teacher, has always been known. It would seem that a personally attractive teacher could arouse enthusiasm in a student for any subject whatever, whether or not the teacher knew anything about it at all. Subconscious attractions and repulsions which have always been regarded as incidental and negligible actually play a predominant part in teaching and learning. The love-hate emotion explains a great deal of the difficulty of teaching."

In conclusion, any viewpoint of psychology that is so one-sided, so certain of its position that it can succeed all previous viewpoints, like Oriental despotisms, by killing their predecessors and their kindred, must be discounted.

In medio stat veritas.

EMANUEL SCHWARTZ.

Seward Park High School.

The High School Library

A lack of adequate financial support is the greatest handicap of the American high school library, according to the National Survey of Secondary Education in its monograph on "The Secondary School Library" just published by the Government Printing Office. Inadequate facilities are the greatest obstacles to the realization of the aims of school libraries, this report points out in citing the conditions of 390 selected schools in 46 States and the District of Columbia.

"The entire problem of instruction in the use of books and of libraries demands investigation," the report concludes in its summary and appraisal of unsolved problems.

Prepared by B. Lamar Johnson, librarian and dean of instruction at Stephens College, Columbia, Mo., and specialist in secondary administration of the National Survey, this monograph is one of 28 special reports now in process of publication. The National Survey was conducted by authority of Congress under the auspices of the United States Office of Education. Commissioner William John Cooper was director of the Survey and Dr. Leonard V. Koos, professor of secondary education at the University of Chicago, was associate director. However, the major burden of directing and handling the investigation was intrusted to Dr. Koos who is eminent in the field of secondary education and nationally known for his contributions for the improvement of public education. Resulting from a three-year survey, this study, it is emphasized by Carl A. Jessen, coördinator and himself specialist in secondary education in the Federal Office, aimed primarily at discovering and studying not the usual but the unusual practices, not the ordinary procedures but the extraordinary ones.

Difficulties listed in realizing the aims of the secondary school library as reported by principals, teacher-librarians, and librarians are as follows: Of a total of 281 reporting, 154 set up inadequate facilities as the greatest obstacle; 85 set up inadequate staff; 29, lack of interest and time on the part of the pupil; 21, lack of coöperation by teaching or administrative staff; and 18 set up as an obstacle the fact that the library is used as a study hall. The other 12 difficulties were of a miscellaneous character including teaching methods in conflict with the use of the library.

The Dewey decimal system of classification was found to be the method of classifying books dominantly used in secondary school libraries.

The results of the investigation and of previous studies are in accord in disclosing that it is the practice of many high schools to employ teachers without library training, assign them full-time teaching loads, and in addition ask them to take charge of the school library.

Instruction in the use of books is given in less than one-third of the high schools. Many high school libraries do not keep records of circulation.

In analyzing the facilities of the library, the report reveals that 330 of the 390 schools studied have separate rooms for their library. In 29 schools the library is housed in the assembly hall and in 15 it is in a corridor. Housing of school libraries is not limited to reading and book worms. The librarians of 129 schools have work rooms; 46 schools have conference rooms; 31 report having library classrooms, and 18 have rooms for visual instruction. Most librarians do not approve of having the library and study hall combined.

However, the opinions of the librarians in this respect are comparatively evenly divided. Twenty-two of the 50 librarians and teacher-librarians in the selected schools having the combination plan state that they like this arrangement. Principals are, in general, satisfied with the arrangement which combines the library and the study hall. Having the library and study hall separate and having them

Scanned with CamScanner

connected by a door meets the general approval of teacher-librarians, principals, and librarians alike. Under the combination plan it was found that 85 per cent of the pupils went to the library on a typical day whereas in those schools separating the library and study hall only 41 per cent of the pupils went to the library. Students appear to avail themselves of every type of library activity under the combination plan.

Not Enough Seats

Junior high school pupils use the school library for pleasure reading more than do senior high school pupils. Many devices have been resorted to by high school librarians to encourage recreational reading. The seating capacities of the libraries appear to be adequate in the smaller high schools, but in the larger schools (especially those enrolling more than 2,000 pupils), the median percentage of the student body which the library can seat is very small.

In a number of schools visited more than 40 per cent of the student body used the school library on the day on which data were collected. High schools use various procedures for admitting students to the library. A number of schools report finding it satisfactory for pupils to go to the library freely without having their attendance checked at any time.

Regular instruction in the use of books in the library is given in approximately two-thirds of the schools taking part in this study.

Data indicate that in the schools coöperating in this study the total number of books increases consistently with the number of pupils in the school, but that the number of books *per pupil* decreases as the enrollment increases. "The size of the book collection ranges from 116 books in a school with fewer than 50 pupils to 30,000 books in a school with an enrollment of 1,500. Fifty-eight schools (including five with enrollments of more than 750) have fewer than 1,000 books in their libraries."

The median number of magazines in the libraries participating in this study increases from 6 in schools with enrollments of fewer than 100 to 42 in schools enrolling more than 2,000 pupils. Of the schools reporting, only 7 did not subscribe for a magazine.

A median number of two newspapers is subscribed for by the libraries in 331 schools. No relation appears to exist between the number of newspapers subscribed for and the enrollment. It was found that 71 libraries do not subscribe for newspapers. This is in sharp contrast to the emphasis placed upon magazines.

Recommendations

Many schools have full-time librarians who are college graduates and who have had professional training in library science. The report indicates, however, that most of the smaller schools employ teacher-librarians. In a number of these schools the teacher-librarians have had library training and at the same time their teaching loads are reduced so that they may devote a major portion of their time to library work.

Among 10 outstanding recommendations which conclude the report of Dr. Johnson are the following: (1) A need for both extensive and intensive study of library standards which have been set up by States and other school accrediting bodies; (2) extensive study to determine the effect of newer methods of classroom teaching on the use of the secondary school library; (3) a series of studies to appraise the methods of encouraging recreational reading; (4) a study of the effect which regularly scheduled free reading has on the pupils' recreational reading habits; (5) continued study of the relation of the library to the study hall; (6) an investigation of coöperation between school and public libraries; (7) further inquiry into methods of selecting books for the high school library; (8) investigation of the entire problem of instruction in the use of books and of libraries; (9) careful investigation of training secondary school librarians; (10) and continued study of outstanding practices, devices, and procedure successfully used in outstanding secondary school libraries.

This monograph is listed as Bulletin, 1932, No. 17, National Survey of Secondary Education, Monograph No. 17, and may be procured from the Superintendent of Documents, Washington, D. C., at 10 cents per copy.

Adler and Our Schools

Like Ulysses, I have traveled many seas and finally come to port. I have heard the siren voice of Nietzsche, passed the Scylla of Epicureanism and the Charybdis of Greek self-realization, and now rest on the shore of Alfred Adler.

Adler's philosophy, in a word, is coöperation. It is unfortunately a trite word, but Adler makes it more than a platitude; he makes it the greatest common divisor of all truly successful lives and the inexorable logic of our common weakness and our common life.

Coöperation has always been recognized in our schools as a most important character trait. In teacher ratings it is listed together with traits like courtesy, self-control, accuracy, and so on. DeWitt Clinton High School, and no doubt other high schools, have adopted the system of grading pupils on "citizenship" which is equivalent to coöperation in the Adlerian sense. A Habit Committee once organized at DeWitt Clinton High School selected as desirable habits coöperation, courtesy, honesty, and so forth. But in the light of Adler's Individual Psychology, coöperation stands altogether apart from these other traits; in fact, it includes all of them.

The wish to play one's proper rôle in society is not altruism; human nature is both social and individual. When it is understood that coöperation is most gratifying to the individual as well as to society, then egotistic objections to coöperation will melt away. To be harmoniously a part of the social whole is to respect both the part and the whole. In fact, no one can effectively coöperate if he does not properly value himself and

Scanned with CamScanner

what he can contribute; self-sacrifice is not the best form of coöperation.

Even knowledge itself would flow from the wish to coöperate, perhaps less intensely at times than from an egotistic urge to excel others, but more steadily and more usefully in the long run both to the individual and to society. Coöperation, social interest, devotion to our common task of maintaining and improving life, these become the goal of education; character building rather than the imparting of skills and knowledge should be the primary purpose of our schools.

Let us analyze a few specific problems with Adler. Laziness in children is a grave problem of teachers. There is nothing inherently good or bad in laziness, the fable of the ant and the grasshopper to the contrary notwithstanding. There is a great deal of misdirected energy in the world today, that, for example, of missionaries, high-pressure salesmen, and munition manufacturers, and the world would greatly profit if such energy were cancelled by mere laziness. It is on such grounds that Bertrand Russell champions laziness. Indolence may well be the order of life in some remote tropical Paradise where sustenance falls into lazy laps. But in our for the most part strenuous life there are problems for all of us collectively and laziness is an avoidance of them. Training a child, however, in the mere habit of industry without any community feeling would do no good; he might become an industrious racketeer or politician. If the child wants to be socially useful, the teacher will not have to worry about laziness; the child will be as industrious (or as lazy) as is necessary for the purpose.

Courtesy was a debated point of the aforementioned Habit Committee. Here again the purpose of being coöperative and socially useful will dictate such courtesy as springs from a genuine regard for the welfare of others and such manners (but no ostentatious embellishment of them) as express a healthy membership in the community of human beings. The useful social purpose will always determine for us to what extent a trait is a virtue.

Similarly for honesty. A student guided by the goal of being socially useful may make mistakes, may occasionally lie, but his mistakes will not be great and his goal will always draw him back to social equilibrium.

It is Adler's thesis that because of faulty upbringing, an incorrect style of life is often initiated in early childhood, a style that has to do in a general way with an exaggerated striving for personal superiority and compensation for a felt inferiority, rather than with coöperation on an equal plane with all other human beings. By this mistaken style the child often underestimates his capacities, misjudges his experiences, and is forever engaged in trying to prove his value rather than in playing his rôle. Adler's method exposes and corrects this mistake in the style of life. Early memories of the child are especially revealing of his initiation of a style of life and may without difficulty be interpreted in the Adler manner.

From Adler's axioms may be deduced many theorems in classroom technique. Courage and confidence are necessary for coöperation and will appear when the latter is the goal. If a high school pupil has no idea what he wants to do in later life, he reveals a lack of courage and Adler advocates asking children the question or assigning compositions on it so that they may not evade the problem. If the child wavers between superiority and coöperation and lacks the courage to strive for superiority through the channel of coöperation, the teacher's task is to increase his courage and self-confidence and to avoid any treatment that under the circumstances will discourage him still more. Such treatments may include punishment, criticism, writing a letter to his parents, telling him he is a blockhead, or expecting too much of him because of a high I. Q. Nor should the teacher appeal too strongly to personal ambition; this is contrary to the spirit of coöperation. Finally, Adler opposes treating symptoms by a rigid formula, like detention for lateness or writing a note to the parents for omission of homework; in fact, treatment of symptoms generally instead of the person as a unit is as unintelligent as it would be in medical practice.

Adler's method has been highly successful in Vienna and there is no reason why it should not be equally successful here. It should supplement the mental hygiene already used in our schools.

A New Deal Primer

A new primer has made its appearance this fall, but it is not written for first grade children. Its title is "A Primer of the New Deal," and it makes available material about the New Deal, so that every junior and senior high school student can understand what the Federal Government has done and is doing to improve our social and economic conditions.

The author, Professor E. E. Lewis, of Ohio State University, in announcing this new primer, said, "This book was written to help the students find out what the New Deal is and what it should mean to every citizen's future. If there ever was a time when everybody needs information about what the Government is doing, it is now. Only through education is it possible to prevent costly mistakes when attempting a new program.

"This primer was written with the assistance of forty men in one of my graduate classes at the University. The book explains in an easy-to-understand way the fifteen major acts of Congress—the National Recovery Act, the Public Works Program, Emergency Relief, the Emergency Railroad Act and a dozen more—giving to the President unheard-of authority by the exercise of which he is supposed to restore prosperity. Some of these acts are revolutionary and constitute important new policies of the Government. Every student must study these acts and watch what is taking place, for we are witnessing perhaps the most significant events of modern history."

Scanned with CamScanner

The Primer of the New Deal is divided into twenty units of from 2 to 4 pages each and contains nearly a hundred charts, pictures, cartoons and other illustrations.

This book is an invaluable aid to all teachers of social science subjects. In amount of material it is equivalent of a 250-page textbook but its price is only 35c, with discount for quantities. It is published by American Education Press, Inc., Columbus, Ohio.

The New Deal Analyzed for Schools

Critical analysis of President Roosevelt's recovery legislation, expressed in clear terms for the ready understanding of American high school and college pupils, as well as adult study groups, has been made by a research group at Teachers College, Columbia University.

The results of the analysis, which was made by a group of legal, economic and educational authorities, headed by Dr. Edmund de S. Brunner and Dr. Herbert Bruner, professors of education at Teachers College, and Dr. L. C. Marshall, Director of the Institute of Public Law, John Hopkins University, will appear soon in pamphlet form. These are to be published by the college and will be distributed to high schools, colleges and adult study groups.

"The people must be informed of every major act since last March, and they must see the relationship of this legislation to the whole picture of economic depression and recovery," Dr. Brunner explained. "The newspapers have been of vast help already in this process. The pamphlets will supplement and give perspective to the valuable information presented day by day by the American press."

To be known as the "National Crisis Series," these surveys, consisting of fourteen pamphlets and a manual, are to treat with all the important legislative acts passed in Washington since March, Dr. Brunner announced. This series is divided into three classes —an adult study group, a senior high school section and a junior high school group.

Members of the Lincoln School of Teachers College who assisted in this project included Dr. J. E. Mendenhall, Miss Pauline Thompson and Samuel Everett.

The adult group of surveys will consist of reports on:

1. In Relief of Debtors.
2. Unemployment and Public Works.
3. The Farm Act of 1933; Its Place in the Recovery Program.
4. The changed scene in industry and transportation.
5. Funds and the Financial System.

Under the senior high school division will be prepared pamphlets on:

1. Debt Relief: an aid to recovery
2. Help for the jobless: direct aid and public works.
3. Helping the nation by helping the farmer.
4. Government coöperates with industry and the railroads.
5. Our Government's relation to money, banking and securities

Junior high school titles include:

1. Uncle Sam aids debtors.
2. Uncle Sam fights unemployment.
3. Uncle Sam aids the farmer.
4. Uncle Sam's partnership with industry and railroads.

A Teachers' Manual on "Education's opportunities and obligation," prepared by Dr. Herbert Brunner, is also included in this project.

The purpose of the undertaking, Dr. Brunner declared, is to disseminate important information concerning the numerous legislative acts that have been adopted in this country since the advent of the "New Deal." Because of the radical changes that have been inaugurated to meet the present emergency, it is imperative that the American pupil, adults as well as adolescents, should understand the significance of these acts, the Teachers College professor said.

"Things are happening so fast at the present time that there is grave danger that the people will be unable to keep up with the new developments," Dr. Brunner pointed out. "We are making an attempt to cut down the amount of social lag. With the aid of these studies, schools can make intelligent use of the tremendously important current happenings at once. Our pamphlets and manuals are written so that they can be inserted into the books used in the high schools, and used in conjunction with them.

"The project does not attempt to whitewash the administration, nor become a propagandistic agent for President Roosevelt's policies. Rather, we have attempted to give all the facts, tell what is going on today, in as impartial a manner as we possibly can. Both pros and cons are given. We had tried to cover the entire field of funds and finances, of inflation, of relief to the unemployed, of public works, of the Civilian Conservation Corps, of Muscle Shoals, of the National Recovery Act, and all other pertinent phases of the present administration. Our purpose has been to present the facts in an open, easy-to-understand manner, omitting all emotional prejudices.

"Because these many new legislative acts have happened so rapidly during the past few months, there is little chance for the ordinary citizen to digest the mass of highly technical laws and find out what they really mean. Thus when an issue arises, he has no adequate basis upon which to appraise it. Unless the ordinary American learns what the new program of today is all about, he will act without intelligence in the settling of legislative problems and may act on the basis of prejudice, ignorance and possibly violence."

According to Dr. Brunner, public opinion is going to register very much more today than ever before. This is true, he explained, because we have now set up under legislative sanction non-elective bodies with power to regulate the daily welfare of vast numbers of people. The code system under the NRA is one direct example of this legislation, the educator pointed out.

Scanned with CamScanner

"Publishing these pamphlets concerning vital current problems of American life is a real attempt to fit new ideas into the changing scene of American life," Dr. Brunner said. "Not only is recovery at stake but our very democracy is weighed in the balance. We must not only know what's going on in Washington, but be able to speak our minds about it."

Copies of the pamphlets will be sent to superintendents of schools, State Teachers' Associations and other educators, Dr. Brunner said. He added that this is probably the first time that a university of the type of Teachers College has attempted to put before the pupils of junior and senior high school age an understandable account of the changing economic and political policies being enacted by the Federal Government.

No attempt is being made to present these studies from an Administration or anti-Administration standpoint, he emphasized. As a service to the country, the series will fulfill its purpose by giving an impartial, unbiased, understandable view of what is taking place in the United States today, Dr. Brunner stated.

Trends in Twentieth Century Literature

Dr. George J. Crane, Chairman of the English Department, Boys High School, will give this term over Station WNYC a series of five radio talks on "Trends in Twentieth Century Literature." The schedule is as follows:

1. The New Poetry in America. October 7, 6 to 6:15 P. M.
2. The New American Novel. November 4, 5:15 to 5:30 P. M.
3. The Drama of Social Criticism. December 2, 5 to 5:15 P. M.
4. The New Biography. January 6, 5:30 to 5:45 P. M.
5. The American Short Story. February 3, 6:15 to 6:30 P.M.

The N. B. C. Appreciation Hour

In fifty thousand schools spread over every State in the Union, the cheery voice of Dr. Walter Damrosch was heard on Friday morning, October sixth, over both networks of the National Broadcasting Company, summoning the largest class in the world to an insight into the beauties of music. On that morning was again presented the courses designated as Series "A" and "B"—"A" for beginners and "B" for those who successfully completed "A" last year.

On the following Friday, October 13, Series "C" and "D" began for those more advanced and continue with the others until May, 1934, comprising two complete terms' work in each series.

"This season's programs," says Dr. Damrosch, "will follow the general outline of our established plan consisting of four concerts graded to constitute a progressive four-year course in the appreciation of music. In order to demonstrate more fully the development of the suite into the symphony, I have included this coming year several characteristic examples of sonata form; and also, with a view to broadening the scope of the entire course, I have introduced chamber music and a large proportion of vocal music, giving special attention to the polyphonic school of vocal composition which reached its finest flower in the 16th and 17th centuries. Another innovation is the repetition, for review purposes and added hearing, of numbers from the preceding programs, which I have provided for Series A."

Once again, Instructor's Manuals for teachers and illustrated Notebooks for Students have been made available. The price of these simply covers production and distribution cost, while the entire series of symphony concerts is again a service of the National Broadcasting Company to the schools of America. The Manual, compiled by Dr. Damrosch and his assistant, Ernest La Prade, presents lesson-plans for every concert, with copious notes for the teacher, music illustrations and an extensive bibliography to carry on all supplementary reference reading. It also contains a complete list of phonographic records available in American catalogues for use in preparation and review of the concerts. The work-books for the pupil, officially titled "Student Notebooks," have been prepared by Dr. Charles H. Farnsworth, Emeritus Professor of Music Education, Teachers College, Columbia University, in collaboration with Mr. La Prade, whose own books "Alice in Orchestralia" and "Marching Notes" are widely used as music readers in the schools today.

When Dr. Damrosch presents his "Musical Family," an opportunity is given to hear the instruments by themselves and to recognize them by the way they sound. This is where the Notebook helps at once, for it contains pictures that allow the listener to connect up the sound of the instruments with the way they look. The pupil also learns how the person looked who wrote the music, for he must identify the composer and paste his picture in the right blank provided for the purpose.

While seeing thus helps in getting acquainted, what really helps even more is learning to think musically. This turns ordinary hearing into real listening. To do this, the pupil must be able to catch and hold in his memory the thoughts (musicians call them themes) out of which the composition grows.

For instance, the pupil memorizes the theme of Schubert's "Military March" in the very first concert. He learns to know it, to hum or whistle it. When he can do this, he has taken the first step in the appreciation of music.

This year have been added chamber music and vocal rounds and roundelays like "Row, row, row your boat gently down the stream; merrily, merrily, merrily, merrily, life is but a dream" (with the melographs to show the parts visually) and "Lovely Evening." Great choruses such as the Bach fugue arranged by Dr. Damrosch himself for voices, and examples of madrigals and motets are other important innovations. Instrumental solos, including a clarinet concerto,

Scanned with CamScanner

and sonatas for violin and piano will be included. Thus another "Musical Family," first cousins of the orchestra, will be introduced.

REVIEWS

The Art of Educational Research

By Harold H. Abelson, World Book Company, Yonkers, N. Y., 312 pp. Bibliography 313-324, Index 325-332.

"The Art of Educational Research," while seemingly another logical step in the preparation of the well prepared teacher or educator, goes farther in convincing one of its desirability than most of the newer books in this general field.
